Works in all kinds of precious metals occupy a consider-able place in the Exhibition. It would, however, be difficult to form from them an exact idea of the relative production of different countries in the various branches of this class of manufactures. Germany has contributed to a very limited extent; Spain has sent but one specimen of her beautiful workmanship in gold and silver for churchservice: several Freuch manufacturers of gilt bronzes have not exhibited at all: the Dutch jewellers' work is repre-sented by only a slople exhibitor: from Sweden. Deonark. Bavaria, and the kingdom of Naples, nothing has been received: America has furnished but an insignificant display: and other exhibitions, burriedly furmed, do uot truly represent the actual production of the re-spective countries. Thus, China offers a miscellaneous collection of objects, some of them made several centries ago, others of English manufacture, or borrowed from private individuals. The Indian exhibition is a treasury of riches accumulated by the East India Company, belonging to widely-different epochs, amongst which it would be difficult to distinguish at once what is modern. The Ionian Islands are represented by a few specimens only.

From the above it is evident that the Jury were compelled to be on their guard against error in their general appreciation of the productions-error which the uncertaioty of a first experiment of a Universal Exhibitiou, the remoteness of some countries, and the reluctance of some manufacturers to come forward, must of necessity entail. The information asked for of the Foreign Commissioners would have been very useful towards drawing np more exact commercial observations; but not having received it in time to be of service, the Jury have confined themselves to the Exhibition itself.

It is sufficient to cast a glance upon the exhibitions of India, Turkey, Egypt, and Tunis, to be convinced that these nations have remained stationary from a very early period of manufacture. Some of them, indeed, develop ideas full of grace and originality; but their productions are always primitive and imperfect, and the skill of the workman is called in to make amends for the inadequatemess of the mannfacturing resources. Their exhibitions might, nevertheless, afford a lesson to the European manu-

facturers, for they display a natural grace in the arrangement of ornaments most happily conceived. Jade, inlaid with precious stones by means of golden bezils, as shown upon some of the very ancient articles in the Indian exhibition, is an elegant and skilful work of art. The fillgree from the same country is as perfect as that from China; and the Indian enamels, though for the most part coarse, exhibit, nevertheless, much merit in design

and harmonious arrangement of colons The European nations must, by the means here afforded for comparing their productions, render each other mutual service. France and Germany will borrow from England whatever is worthy of imitation in her manufacture of plate for useful purposes; while England may derive instruction from the gold and silver smiths of the Continent, in reference to objects of ornament east or reposses, and finely chased. Gilt broazes likewise may become better appreciated, and be mannfactured upon a larger scale. In the setting of precious stones, jewellers will call to mind the beautiful productions sent by Russin, Regarded in an artistic point of view, the French, German, and Russian exhibitions will leave permanent traces behind them; and every nation, according to the amount of its genius for imitation or invention, will easily discern the onward path it ought to follow. The same advantage will arise from the improved or novel processes brought to bear upon the working of precious metals. Every nation has its peculiar methods of easting, mounting, fitting up, and finishing, which have not escaped the of manufacturers and intelligent artizans. attention Gold-plating, silver-plating, the electro process, stamp-ing, the initiations of gilding and silvering, maintain an important position in industry and commerce. The inferior metals or alloys, bronzed, silvered, or gilt, the imitation jewellery and artificial stones, are estimated necording to their quality, and are largely used in Ea-ropean commerce, and as articles of export. The warking of precious metals under their various forms is applied to objects of domestie use and sanatory purposes, and to the fine arts. In this respect, the Exhibition offers every advantage for the instruction of practical men, and of those who have a just appreciation of traditional taste and the demands of oivilized society.

ELEINGTON, Mason, and Co., New Hall Street, Hirmingham (1, p. 671). Messrs. Elkington and Mason are the first who introduced into England the application of the electro process to gilding and silvering. Their collection includes objects most varied in their forms and dimensions, intended for table service and for purposes of orannent, executed for the most part in copper, or in a compound metal alloyed with nickel, called German silver, and coated with silver by their electro process. The designs are generally produced in copper by the electrotype process, and afterwards wholly ur partially gilt or silvered by means of electricity combined with the alkaline saits of gold and silver,

Several yases, such as copies of the cups from Herculaneum and Pompeii, and various articles of ornament, are made entirely of pure silver deposited by the action of electricity. They are usually lined with wrought metal, electricity. They are usually lined with wrongth metal, either to give them regularity of form in the inside, or to render them fit for use. The Jury have particularly noticed, among the works of Messex. Elkington and Mason, the heautiful group cutricyl of cast silver re-presenting Queen Elkington to horseback, between a gentleman in waiting and a page, after a model executed by M. Jeannest, a French artist. This group is, in the opinion of the Jury, a very choice work of art: but they specially recommend for the Council Medal the large jewel-case of gift and enamelled copper, ornamented with portraits upon porcelain of the Ruyal family, and with figures in full relief after designs by M. Grüner; and also the large circular plate called the Shield of the Amazons, a reverse copy of the original work, silvered and gilt in parts. These works of art and oronment ofter the best specimens of the application of the electrotype process for the exact reproduction of objects in

copper, and of precious metals to urnamental purposes.

The Jury, however, desire to guard against being considered as expressing an opinion on the merit of the application of the electro process of silver plating to objects of domestic use. They desire only to commend the ar-tistic application of this discovery, to which alone they are inclined to think it adapted. At the same time they acknowledge that the application of gold by this process is a highly-meritorious invention, tending alike to the economy and durability of the metal applied, and to preserve the health of the artizan from the dangerous

Money, J. V., and Co., 7 New Burlington Street, London (117, p. 603), exhibit a small number of objects, the greater part of which are worthy of attention from the care and taste displayed in their execution. Among these are different pieces of plate for table-service, including a centre-piece in the style of Louis XV., executed with much care: a bouquet in rubies and diamonds of the first quality, representing a rose, a tulip, and a volubilisthis can be taken to pieces by a very ingenious contrivance, and transformed into a stomacher, head-dress, brooches, and bracelet; the rubies, which are of a very even colour, are set in besils of gold:-a vase of silver gilt, ornamented with a silver bas-relief, the subject of which is a hunt amongst branches of oak, executed in the style of Albert Durer; the chasing of the bus-relief is admirable:-a silver-gilt sugar-basin, with cover, of faultless shape, and chased with ornaments in relief, very much deadened and of rare perfection. But the principal object of the Jury's approbation is the rich and landsome series of chalices and cups of various kinds in precious materials, ornamented with cusmels, exhibited by Mesars, Morel and Co. They would instance especially a cap of Oriental agate, the gold mountings of which are composed of enamelled orsaments and birds of paradise: the pillar is ornamented with chim in relief, coamelled, surrounding the esenteheon of H. I.H. the Hereditary Grand Duchess of Russia; and the foot is covered with beautiful arabesques enamelled: the taste displayed in this article is excellent, its cumposition s original, and it is very well executed after models by M. Mévillé. A nautilus shell of lapis-lazuli, supported by two enamelled figures of Tritons entwined with marine plants and flowers, and resting upon a rock covered with water and coral: the handle is furmed of a chimera ex-

quisitely cuamelled, a copy of one on a celebrated cap in the Louvre: the manner to which this article is executed gives evidence of as much skill as taste: the model of the Tratous is the talented work of M. Constant Sévin. In the same rank must be placed another cup in Oriental agate, made in the form of a sea-shell (plagiostoma), The pillar is composed of a female figure, borne by a Triton with horse's fore-legs: at the back part of the shell is the handle of the cup, formed by another female figure sitting upon a dolphin and holding her flying draperv, the extremities being supported by Cupids: all these figures are cuamelled with superior taste. Two other vases in rock crystal also merit special mention. first is a ewer with its dish of the same material, engraved with fine arabesques: this portion of the article is in the style of the sixteenth century: the mounting is copied from the celebrated ewer in the museum of the Louvre, the enamelled gold monntings of which have served as the model: this is a masterpiece of imitation, and has been executed by the order and under the di rection of Mr. Webb, an culightened lover of the fine A vasc, mounted in gold and enamel, is remarkable for the extreme delicacy of its carved enamels, and for the skilful execution of the figures and ornaments. Many other articles of the same description and of similar quality constitute a whole which the Jury regard as worthy of a Council Medal,

WEISHAUPT, C. M., Sons, Hanan (Prussia, 412, p. 1073), exhibit a set of chess-nurn and board, the pieces in 1973), exhibit a set of cless-nen and board, the preces in gold and silver, partly canaelled, and representing the Course of Clearles V. and of Francis I. They are en-tirely can and nucley exceeded. The board exhibits superior qualities. It is made of silver, supported by four neumainds of silver gilt and enamelled in parts: from their shoulders hang garlands of enamel, ornamented with rubies and pearls, held up by gilt figures of children standing upon tortoises. Upon various parts of the garlands are placed herous of silver with blue enamelled wings. The squares of the chess-board are composed of mother-of-pearl and tortoiseshell. The whole is remark-able for its choice workmanship, and for the very skilful combination of silver with enamel and fine stones; the garland especially is executed in excellent taste, and must have presented considerable difficulties in monnt-ing and enamelling. The Jury consider Messrs. Wels-haupt deserving of a Council Medal for this happilyconceived and well-executed work. GARRARD, R. and S., and Co., Panton Street, Hav-

market, London (98, pp. 688, 689), exhibit a collection of articles in precious metals and in jewellery, the mense extent of the manufacture of works in gold and silver in England.

There is, among the articles made in silver by Messrs. Garrard, a complete ten-service, consisting of seven pieces including the tray, in the Persian style, of very fine work-mans...ip, the whole, with the exception of the small figures on the covers, made of silver in repouse work, A table-candiestick with three branches, in the Queen Anne style, well conceived and very fluely executed. A candiestick without branches, of a hexagonal shape, very well made, in reposser work. A candelabrum with six branches, ornamented with foliage and fruit, of elegant design. A ten and coffee-service in repouse work, with cast handles, which, though of a style rather undecided, is of very appropriate workmanship. Several other darable and well-made trays and ten-services. A large ewer for a race-cup, representing Hereules combating the horses of Diomedes, and surrounded by ornaments and emblems symbolical of the labours of Hereules. The handle symbolical of the lanours of Herenes. Inc mount represents the hydra of Lerna. This piece of plate, entirely east, has a grand effect, and its ensemble gives it a real importance: the subject is well chosen, and the composition original. Several covered dishes, one of them of hexagonal shape, the others of the patterns known as the "bead and scroll" and the "bead and shell,' show the care and solidity with which plate for the table is made in England.

Annexed is an abridged catalogue of the principal articles of jewellery exhibited by Messes. Garrard:-

Necklace, stomacher, earrings and bracelet, in magnificent opuls and brilliants, a noble and tasteful set :- a very rich set of magnificent sapphires, pearls, and brilliants tiars enriched with fine oriental pearls, and large brilliants of great parity, with a brooch to accompany it:-an elegant gold bracelet of Gothic design, on which are elegant gold praceses of Gottie design, on which are clusted out, upon a trellis-work of gold on blue enamel carved in the style of the fifteenth century, two angels holding a pearl and a ruby, and capable of being dehotting a plant and a thory, non capable to come such tached; the design by Mr. Smith:—n pearl necklace, with a circular medallion of rubies and brilliants, well made and in good taste :- a pendant in the Renaissance style, with figures in gold, rubies, brilliants, and pearls, upon green and red cuamcis, of fine workmanship:—a gold chased bracelet with a centre of emeralds and brilliants; the stones are fine and pure, and the bracelet is well elased. Another bracelet of hright gold, its centre ornamented with rubies and brilliants in inoration of the sculptures of Nioeveh, a curious and carefully-executed eopy, singular for the great antiquity of the model from which it has been taken; several brooches und rings, of which fine and scarce stones are the principal ornaments. This exhibition, taken as a whole, indicates manufacturing capabilities of the highest order, and an attentive stud of all that can conduce to progress in this brauch of national industry; and for these reasons the Jury recom-mended Mesers Garrard for the Council Medal.

HUNT and ROSKELL, 156 New Bond Street (97, pp. 687, 688).—The exhibition of Mesers. Hunt and Rokell presents an assemblage of articles of rare magnifi-cence. The Jury, being required to point out those which they prefer, would direct attention to certain objects of special excellence, and particularly to some very beautiful bracelets, one in emeralds and diamends; another in opal and emerald, with white enamel; a third, which has a charming effect, composed of a fine opal, surrounded by brilliants and small emeralds upon white enamel, with foliage of gold. The Jury also mention with praise a bonquet of diamonds, as rich as it is elegant; which can be entirely taken to pieces, even to the petals of the flowers, for the purpose of cleaning, and for forming into seven brooches; and which but for its weight would defy criticism. The Jury, however, prefer, among all the articles in Messrs, Hunt and Roskell's exhibition, the sase executed in reposts silver by M, Vechte, which was shown several years ugo in an exhibition at the Louvre. representing the fight between Jupiter and the giants. The deity, represented sitting upon bis engle, forms the cover of the vase; upon the body and handles are the gignts endeavouring to scale the heavens, and hurling trees and rocks at Jupiter; at the foot lie allegorical figures in alto-relievo; other figures are cugraved upon the ground of the vase in very low relief, with a mutted background. The same arrist, M. Vechte, has com-menced for Messrs. Hunt and Roskell a large shield, in three oval compartments, representing the apotheosis of Milton, Newton, and Sinkspeare. The Jury recom-Milton, Newton, and Sinkspeare. The Jury recom-mended a Council Medal to be awarded to Mesers. Hunt and Roskell for the Japiter vase and for the bouquet of diamonds.

HANCOCK, C. F., 39 Bruton Street, Berkeley Square, London (112, p. 692).-The articles shown by this exhihitor are to be noticed, not for the large number displayed, but for their peculiar qualities considered in an artistic point of view Mr. Huncock, white respecting the traditions of English art, has been desirous of introducing into it improvements of a special kind; and by the variety and versatility of style observable in his works, he seems to buye attained this object. The principal articles are:--a round elony table inlaid with silver, upon which is a silver vase in the form of an antique hydra with three handles, covered with pulm-leaf ornaments and burnished folinge opon a matted ground; all the ornaments are made separately, and soldered to the vase, which is hammered out of a single plate; the table is inlaid with much care and faste; me text are in Orthan Saves executed plated. Two groups for recing-prizes, in good taste, and carefully executed. The first represents Queen Elizabeth on hone-back, accompanied by a page and a gentleman in waiting, with two greyhounds following, executed after a

model by M. Marochetti, the dogs after models by Mr. Macarthy: the second, Robin Hood contending for the archery-prize in presence of the sheriff of Nottingham, after a drawing by M. Engène Lamy. An ebony box mounted in silver, after drawings by M. Engène Lamy, remarkable for its fine essemble and for its silver monn ings, and beautifully semiptured and of good effect, in the style of Louis XIV. Upon the lid is a large water-colour drawing, representing genii bearing the colours of the 79th Comeron Highlanders, to whom the box was prescuted by M. Demidoff; and on the inside of the lid is a fine water-colour drawing of the rock of Gibraltar, Several other articles exhibited by Mr. Hancock are worthy of being mentioned; such as the group in silver of a knight combating a dragon and a lion, after a model by Mr. Macarthy: a dessert-plate, with knife, spoon, and fork, the whole ornamented with vine leaves, and wrought in silver carefully and gracefully: a good silver cande-lubrum, in the foliated style of Louis XIV., with five branches formed of scanthus leaves; and several other articles in the ornamental style for table use. The whole of Mr. Hancock's exhibition shows an accurate knowledge of the silversmith's craft, and of the resources which art can apply to this branch of industry when it is properly brought to bear upon it. The Jury are of opinion that on these grounds Mr. Hancock is deserving of the Council

MARREL BROTHERS, 27 Rue de Cisoiscul, Puris (331 France, p. 1194).—The principal article exhibited by Messra, Murrel is the vase representing the combat of Theseus with the Amazons, after the celebrated picture by Rubens. This copy in alto-relieve of a picture as much noted for its composition as for the complex character of the scene represented, offered considerable difficulties to the artist, which he has surmounted with unquestionable success. The bus-relief is in bronze silvered; it is repeated apon the two sides, and fixed to the frieze of the vase. The vase itself is executed in broaze git, in the Louis XIV, style, and bears the arms of its owner, His Royal Highness the Duc d'Aumale : the handles represent Amazons upon sea-horses. A silver cup, in the Renais-sance style, richly ornamented with figures; -- another by the same artist, with medallions of buccharnlian figures, partly in repossed work and partly classed and gilt;— another of silver gilt, inlaid with arabesques of blue enamel: these form but a portion of this remarkable col-lection. The Jury would further mention a very beautiful silver hauring-knife, the hilt of which represents St. Hubert standing within a niche; the cross is ornamented with a fox at bay, defending itself against several dogs; apon the chape of the sheath is a bandsome has-relief. representing the conversion of St. Habert, and lower down is a hunting trophy. The execution of this hunting-knife leaves nothing to be desired. The same maker shows some seals ornamented with beautiful little figures, office articles, seent-bottles in lapis lazuli, Venetian aventurine jasper, cuamels, suuff-boxes and other boxes of most varied styles and perfect workmanship, both in enamelling and chasing. Notwithstanding the merits of the other ways it is especially for this latter portion that the Jury recom-mended Messrs, Marrel for the Conocil Medal. Rubolpm, J. F., 3 Rue Trouchet, Paris (1465 France,

description: among others is a Byzantine casket in the form of a shrine; the portion of the lid forming the root is ornamented with blue enamels, and the sides with other enamels of figures of angels upon golden and green back-grounds; apon the summit of the roof is a representation of the coronation of the Huly Virgin, accompanied by two angels, the whole in full relief, and made of silver gilt: the enamels are fine, and the casket ornamented with rock erystal, cut and set in coloured foil, has a remarkable effect. A bracelet of oxidised silver represents three children contending for some birds, which one of them is carrying off: M. Le Roi is the author of this benutiful design. Another bracelet io oxidised silver, from the design of M. Masson, represents two Cupids playing amongst the stalks of the vine, and holding up a supplier, with four pearls in the form of a claw -very finely chased, and in good taste. A small group, formed of irregular-

p. 1246).-The articles exhibited are of a most varied

despel, pouls, of the greathens in doublet fighting, and will will seed and district and will work and district mess of eliments, and is executed in a very plosing mess of eliments, and is executed in a very plosing poul out at large counces plot representable, the results of Amphiritis, after a model by the late Wagner. A format of the poul of the policy of the Wagner. A format table of cost of the policy of the Wagner. A format of the policy of the policy of the Wagner, and Norder, with 10 between 10 betw

GUEVPOV, A., 11 Rue Chapon, Paris. (1619 France, p. 1254, 1255).—The variety of objects exhibited by pp. 1254, 1250).—The variety of investion and a felicitous application of old as well as novel processe The Jury would mention particularly the History of the Horse represented on seven medallions upon a cup of cast and chased solver of very good shape. A cup of cast silver, partially gilt, representing subjects of the close, and having at the bottom a medalfion of Diana of Fontaineblean. A perfume-hurner, with a garland of ook intermingled with objects of inquimate nature, its lid formed of a vulture. An obtaing casket, the sides enfigure of a Greeian female adjusting her earrings, while a Could holds her mirror: this piece is in cast silver and chased in a very artistic manner. Several boxes and eigar-cases, oronmented with handsome lus-reliefs, in east and chased silver, very light, or produced by the electro process in silver and also in copper silvered. A heantiful ouquet in also-relievo, made in copper, and also silvered by the electro process. A group in cast silver of an Egyptian holding in a rearing horse, one-fourth the natural size. All these articles, especially those that are chased and those produced by the electro process, pertaining at once to works of jewellery and of the silversmith's art, give M. Gueyton a very honourable position among the exhibitors, and have induced the Jury to recommend him for the Conneil Medal.

FROMUNT-MECRICE, 52 Rue St. Honoré, Paris. France, p. 1258,) -- The articles exhibited by M. Froment-Mourice consist entirely of gold and silver smith's work, trinkets, and jewellery, artistically treated. Among them are to be remarked two elegant brooches in the Renaissance style, in rubies and opals, with bulliants arranged in the form of a fringe, one of them being very large, the other smaller. A beautiful bracelet, in the same style, in blue enamel, gold, and brilliants. A brooch, in the slope of a eross, in black enamel, having a supphire in its centre, with branches and garlands of brilliants, upon which is a bird with a budy of pearl. The Pope's chalice, the ornamenting of which is at once elegant and novel, is exe-The toiletented with remarkable and appropriate taste. table of Her Royal Highness the Duchess of Parma is a remarkalde work, iu which M. Froment-Meurice has avercome all the difficulties of the silversmith's and jeweller's art, in east silver, repower work, enamelled and inlaid enumelled work, and engraved steel. But the attention of the Jury has been arrested by a centre-piece, representing Ceres, Bacchus, and Venus, standing upon the terrestral globe, which is encircled by the zodiac, and around which thy small figures in relief of the genii of Plenty, Music, and Concord. The globe is supported by made and female snake-footed ginuts, and rests upon a hase decorated with ornaments and foliage. This piece, executed after models by M. Penchère, is in style and execution such as in the estimation of the Jury merits a place in the first rank. It is entirely made in represenwith the exception of the figures of the ginus. It is sufficiently light to be easily portable; and the mount-

ing is so arranged that the principal portions may be taken as under with case, without in any way affecting its solidity. For this article the Jury decided upon recommending M. Froment-Meurice for the Council Medal.

WAGNER, EMIL, APGEST ALBERT, Berlin. (840 Pres 1096.)—The Jury recommend for a Conneil Medal. Wagner, the maker of a silver centre-piece for the table, having three stages one above another. forming the lose consists of a plinth, supported by fions. Upon the plinth are represented figures of the human race in its primitive condition, seated and grouped at the foot of an ook tree, and accompanied by animals and implements characteristic of the chase, of pastoral life, and of fishing. Above these, three female figures, standing naming. After there, there remain in the relative and the cultivation of the vine. These figures support a bowl, the sides of which are formed in reposses work, and orna-mented with numerous figures of children, or small geniof industry, the Sciences and the Arts, gracefully grouped, and forming very animated compositions. From the centre of this bowl rises a palm-tree, surmounted by a winged figure, representing the genius of civilization, and the subduct of evil, which is typified by an expiring hydra. The whole of this piece, with the exception of the has-relief of the bowl, is cast and chased: the composition is entirely M, Wagner's. The figures of the genins, and the three females standing against the pillar, have been modelled by Professor Fischer. The repostar bas-relief of the hout, which is not quite finished, is M. Wagner's own work. The Jury recognise in this centrepiece a fine style, an exalted character, excellent sculpture, and good effect. The most studious care, united to extreme skill, has guided the execution of the whole of this work, which is worthy of the high position held by the arts in Germany, and worthy of the Exhibition is adorns.

The King of Prassin's shield, (98 Main Avenne) .--HIS ROYAL THURNESS THE PRINCE OF WALES (P. 110), exhibits a shield, presented to him by the King of Prussin upon the anniversary of his christening. His Majesty furnished the general plan of the work : the drawings for it were designed by the celebrated painter Cornelins, the a wee assessed by the ceneurated painter Cornelins, the architectural ornaments are by M. Stüler, the modellings by M. Fisher, the goldsmith's work by M. Hossauer, the reposse by M. Mcreens, and the engraving of the stones by M. Calandrelli. In the centre is the head of Christ in gold alto-relievo, in a round concave medallion bordered by a wreath of acanthus leaves, which stand out upon a circle of blue enamel, with golden stars, the whole upon a large Greek cross, which is covered with the following gilt bas-reliefs: Justice, beneath which is a round me-dallion of St. Mark, surrounded by four chrysoprases: Prayer, beneath which is St. Matthew; Religion, with St. Luke beneath; and Charity, beneath which is St. John. Between the arms of the cross are four bas-reliefs, - Moses striking the rock, the Lord's Supper, the fall or manna, and the baptism of Christ. Around this cross is a frieze of blue camel, craamented with vines, with pea-cocks, and folinge of palm-leaves. Between these enamels are cameos upon German onyx, representing the twelve Apostles. The next circle is composed of oval-shaped ornaments of white enamel, between which are green einque-foils with golden pearls, the mounting of which is golden foliage upon a background of white enamel with small green leaves, around which is a twisted border. The large bas-relief which surrounds the shield represents the entry of Christ into Jerusalem, Judas betraying Christ to the Placisces, the burial of Christ, the Resurrection, the descent of the Holy Ghost upon the Apostles, and the hirth of the Prince of Wales. Upon the next bas-relief is represented the arrival of the King of Prussia in England; his galley steered by angels, and propelled by personification of steam; he is welcomed by St. George, y an allegorical representation of the Thomes, by the Duke of Wellington and by Prince Albert. The exterior Duke of Wellington and by Prince Ameri. The exterior edge is decorated with interlacings of white and green enamel, with buttons of flowered glass. Lastly, the concave edge is ornamented with inlaid enamel-work, in the furn of a garland of fruits, grupes, and ears of corn.
This shield, worthy of remark for its composition, and

for the beauty of its sculpture, enamels, cameos, and fittings, merits, in the opinion of the Jury, a Council Medal, as a reward for the talent of the artists, who have executed the orders and carried out the idea of the King of Prussia.

SARIKOFF, IGNACE, Moscow (366 Russia, p. 1384), oxhibits several articles in silver, consisting of vases of varied and original forms executed with much care: of very elegant statuettes in cast silver, especially one of a female figure reclining upon the hrink of a well, and looking at her image reflected in the water; the cylinder of the well is hollow, and gilt inside, forming, when reversed, a drinking-cup: another work represents a female figure leaning against a cask and pouring out beer, a cat is shown climbing up the cask behind her; this piece forms a teapot, the cask serving to contain the liquid, the vase held by the female figure being the spont. These wase acid by the remain ingure ocing the spool. These two compositious are perfectly original, and the workman-ship is gracefully and carefully executed. The talent of M. Sazikoff is, however, especially displayed in a large centre-piece representing a fir-tree, at the foot of which the Grand Duke Dmitry Dotskoy, sitting wounded, is learning from his soldiers that he has gained the victory. The composition of this group is excellent: the chasing possesses great fulness, and is, at the same time, moscarefully executed: the figures, fine in composition and superior in execution, possess a great degree of originality, and are arranged in a natural manner; and the character as well as the merit displayed in this group place it above anything hitberto produced in this description of manufacture. The Jury recommended a Council Medal for

KARMMERER and ZEFTIGEN, St. Petersburg (376 Russia, p. 1384), Jewellers to the Imperial Court of Russia, have exhibited a diadem wreath in imitation of the leaves and fruit of the bryony. The leaves are in diamonds, and the fruits in emeralds cut in very elongated pear-shaped forms. The different portions of this wreath can be taken upart and used separately: 2,836 rose-diamonds, 129 brilliants, and 12 emeralds, are contained in this beautiful ornament. Next is to be observed a "berthe" formed of bouquets of currant-branches in diamonds, the fruit formed of polished upont rubies suspended at different points upon a donble string of diamonds, and arranged siternately with flowers in brilliants; its effect is excellent. The Jury have further remarked two other articles in the same collection, a bouquet of eglantine and hily of the valley entirely in hrilliants and roses; also a brooch representing a branch of the ipomen in diamonds and beautiful turquoises. The importance of the articles in this collection, the superior taste in composition, and above all, the perfection of the settings, not excelled by the works of my jeweller in the Exhibition, have induced the Jury to recommend that to Messrs. Kaemmerer and Zeftigen be nwarded a Conned Medal.

M. Sazikoff.

nwarded a Conned Medal.

LENONNIER, G., 6 Place Vendome, Paris (304, p. 1191).

—The collection exhibited by M. Lemonnier has constantly and justly attracted considerable attention. The qualities which eminoutly distinguish the Jewels belonging to the Queen of Spain are a very decided and elevated taste in the composition, an imposing aspect, and great skill in giving effect to the materials at the disposal of the jeweller. M. Lemonnier has executed two sets of jewels for the Queen of Spain. The first consists of a diamond necklace in the form of a ribbon, interlaced with foliage of emeralds. The stomacher and shoulder-knots, from which are suspended vary large emeralds with clusters of brilliants, are in the same style, and in them the jeweller has overcome considerable difficulties presented by the design. The bouquet is formed of lilies of brilliants, the leaves of emeralds and ribbons of brilliants, with pendants of pearl. The crown is in the same style, with aignillettes in the form of flowers having stamens in pearl. The bracelet is likewise a ribbon of brilliants, interlaced with emeralds. The whole of this cullection displays, in the great harmony and simplicity of its arrangement, much adroitness on the part of its inventor in making use of a profesion of precious stones without allowing their immeme number to mar the general effect. The same may be said of the set of jewels made in diamonds and sapphires,

also belonging to the Queen of Spain. The crown is composed in the heraldio style : in the centre of the dismond flowers is a sapphire; a beautiful wreath of brilliants accompanies the crown, with which the stomacher and the necklace match perfectly; upon them are flowers of bridliants with centres of sapphires with garlands and longshaped pendants. The whole of this set presents an ensemble worthy of the talent of M. Lemonnier. It is impossible to speak of other articles of secondary importance to those just described, though they would elsewhere be deserving of notice. M. Lemonnier bus thoroughly attained the end which should be kept in view in the exeention of jewellery, to strike and gratify both the eye and the imagination. As a setter of stones he is excelled by many other jewellers; in point of invention and decernion As a setter of stones he is excelled by be stands unrivalled in the Exhibition. The Jury recommended him a Council Medal.

VITTOX, G. T., 10 Rue des Filles du Calvaire, Paris (1530, p. 1250).—The attention of the Jury has been attracted by the bronzes and the works in gilt bronze, exhibited by M. Vittoz. They can only speak of the thronzes which are either woolly or partially gilt, to which they are limited by their instructions. They have observed a clock in gilt bronze, called the "three hours of the day:" it is ornamented with Curids upon a cloud, and supported by a pedestal of white marble. The Cupids are in bronze, and the style of Louis XVI. is preserved with much tasto and care in the execution. The sums clock is exhibited in double the size. A console candolabrum, in the Louis XIV. style, entirely in gilt bronze, is composed of three rich volutes springing from the foot, and entwined with garlands of cak, the whole sup-norting branches of lilles and mallows. This article is porting branches of lilies and mallows, executed in remarkably good style, and the gilding has an excellent effect. A broaze figure of a child, of tha size of life, bearing a basket from which issue fruits, flowers, and branches, gilt, presents a rich enemble by the nowers, and orances, gut, presents a rice encounter by the contrast of the hronze with the gold, and is of excellent workmanship. The group of children in bronze, half the size of nature, carrying banches of grapes and resting upon a rich ataud in gilt brouze, is, in the estimation of the Jury, the best piece in this collection so distinguished by the choice of models taken from the most skilful artists, and for execution with a care which no other maker has surpassed: the whole of the gilding is effected by the electro process, and appears to be executed in tho

by the electro process, and appears to be executed in the best manner. The articles noticed claim from the Jury a recommendation for a Council Medal. Monathlas, F., Madrid. (Spain, 261, p. 1345).—It is to be regreted that Spain, a country renowned for its works in precious medals adapted for the purposes of Divine worship, should have sent but one article of this description to the Exhibition. The Jury have neverdescription to the Exploration. The Jury make never-theless seen, with satisfaction, the monstrance exhibited by M. Moravilla. This choice specimen of the silver-smith's art stands about 6 feet 6 inches high: it is mada of silver gilt, in the florid style of the fifteenth century. At the base are four bas-reliefs in silver, representing th Lord's Supper, Christ bearing His Cross, the Garden of Olives, and the entry into Jerusalem. Upon the platform are four figures in silver of angels in the attitude of prayer, their faces turned towards the octagonal base of the monstrance, the shaft of which is ornamented with figures of the four Evangelists in full relief beneath Gothic turrets. The monstrance itself is radiated in the form of a double wreath composed of vine hranches, clusters, and hrilliants. Surrounding it are fourteen stars or comets cumposed of brilliants, topazes, amerity sis, and emeralds: the cross is composed of hrilliants and ansethysis. The rasemble of this large work perfect. The Jury have particularly remarked the regularity of adjustment of the various parts, so difficult to Gothic spire, and conceived in a style of architecture which demands this very regularity as an absolute condition of good execution. On these grounds, the Jury proposed that a Council Medal should be awarded to proposed that a Council Medal should be awarned to M. Mornilla; which being refused by the Council of Chairmen, a Prize Medal was given.

PAILLARD, V., 8 Rue St. Claude au Marais, Paris 2 L 2

(France, 1713, p. 1258), exhibits some broazes which the Jury have examined with a great deal of interest; especially a beautiful figure of a child, of the size of life, crowned with vine branches, and holding a rich condelabrum of gilt bronze. It rests upon a three-fronted pedimeut of gilt bronze, in Louis XIV.'s style, which has a fine effect. A large clock, with candelabra in gilt bronze, in the style of the latter part of the reign of Louis XIV. Two vases of porcelain, the backgrounds of which are of turquoise blue with rich mountings of gilt bronze, composed of a grooved moubling around the neck of the vase, handles formed of infinitine vintagers clitabing upon a volute: beneath are heads of chimeras, from which a carland proceeds to the centre of the vase. Lastly, a pair of candlesticks, in the style of Louis XV., with twisted stems, the feet organizated with escutcheous. It is principally as an actist in gilt brouze for room decoras, that M. Paillard has distinguished himself in the Exhibition; and it is on this account the Jury recommended him as deserving of a Conneil Medal, which having been refused by the Council of Chairmen, a Prize Medal was awarded,

Medal was award the Prize Medal to Messers, Water and Sov, of Dablin (15, p. 673), for their broaches and trinkets in gold, ceptied with much taste, yet not servilely, from the antique filoulæ found in Ireland; also for their neckhees, in which they have turned the almost forgotten style of the mediaval age to a very good account. The Jury award the Prize Medal to Lamanar and

The July about the Print Media to Labridge and their carefully-secured, elegant, and morel silvessmittle heir carefully-secured, elegant, and morel silvessmittle work,—in particular, for a round flattened vase, with a long mek and a lot, in the Creatant syile, the body and long mek and a lot, in the Creatant syile, the body and and barrishled bunches of grapes; a los. for a centre was neckon-loped and flattened, hunting a long neck, the divisions of the side and the neck oreassented with fidisless in which would appear to be very darmle, and begitness, which would appear to be very darmle, and begitness,

and the state of t

The jowellery and trinkets of Rowlassus, C. and W., 146 Regent Street, London (118, p. 693), are remarkable for their fine execution, particularly a blue enamel brooch with a large polished and nucnt garnet, two beautiful bracelets, and a brilliant and emerald stonarcher. A Prize Medal is awarded for the enerfulores and elegance of

Modali in Melhadis on Cinciumer and assignment of Causevice, T. J., and N. Sheffield (4.5, p. 680), enhibit articles important in size and of good taste. They are of plated silver, plated by the old poscose of uniting the mench by best the edges and manufage are of silver, examined to the complex of the control of the silver of Louis XV, The workmanthy of their diffusioners, tempots, and tray, is as carefully executed as this style roughters, and tray, is as carefully executed as this style roughters, and professing along the complex of the

A Price Weels is swarded to Axena, J., 10 Straak, London (111), pp. 691, 622, for his examelled articles; opcially a ever vase with silver ground, douted with hourshed enhosings, and ornamented with tempose-blue councir, also another silver-pilt vase, with vine-shaped londs, and humished and expared needlines, with commit ground of green and tempories like and créabil and trappiss blue and red canane, the chain of which is very leastiful, and another-bracelet in the Elizabethan style in gold, lettinas, and light-blue emmel.

Divice and Soxs, Shelfield (i.s., p. 479). These mannfacturers have exhibited a collection of coffee and ics services made of Britannia metal, an imperfect imitation of silver, as are all the compounds used for that partopue;

but the forms are as varied as they are well chosen, and might be very advantageously imitated for the same articles in silver: the workmanship is very good, and the

stary award the Price Medal in consequence.

S. H. and D. Jiasa, 168 Regret Street, London (83, p. 683), exhibit an article of jewellery in the remissance style, representing the figure of Britannis, the face and haids of which are of silver, and the drapery of rubies and diamonds; it stands beneath a canopy supported by four columns of garnets with predicate of pearl. The art with which these precious stores are mounted appears with which these precious stores are mounted appears.

with when mose previous scores are incomercia appears to the Jury to be deserving of the Prize Medal, which they award to Messey, Gass for their skilful workmanship. J. Kerrat, 59 Britonnia Terrace, City Bond (121, p. 694). The commanion services exhibited by Mr. Keith are five in number, of silver gift, and in the mediaval style, well engraved and cannolled. They are rewarded

J. B. Demans, 456 New Oxford Street. (Class XXI, 45, p. 50x). Amongst the arricles made of steel shimilard to their examination, the Jury have remarked a beneathed clastical, earthly of weight steel; it is expected to the control of the control oxford the cont

HEXLEY and Sons, Mount Street, Birmingham. (Class XXII., 305, p. 628.) The Jury likewise award the Prize Medal to these exhibitors for their elastelaines, purseornaments, and buckles, made entirely of steel, and of very perfect workmanship.

very perfect workmanship.

LEXCHARS, W., 38 Piccidilly, London. (Class XXIX.,
44, p. 791.) The silversonith's work in the dressingcases of Mr. Leuchars is well made, elegant, and solid.
A lady's dressing-case of walout wood, mnauted in the mediareal style, with pierced silver fittings, is particularly to be remarked. The Jury award Mr. Leuchars the Prize Medal.

Gapt. L. L. Boccawer Interness, Cliffon House, Old Brougner (Class AXX, 22x, 844), has exhibited one very delicate objects, principally of natural history, below, and estonatory, which he has covered with a nad of melicient traveght to admit of their belop moddled in sand. The casts takes from objects thus prepared retain the exactness of the original, everything on which may be nimethy traved by the dood of amgoriting place when the contract of the contract of the contract of of expections with the most desirable occurses. The Jays award the Piric Robot lost increase.

E. S. MARHALL, 31 John Street, Toricoham Court Bond, London (Class XXIII), 104, p. 689); chibits a collection of gold leaf of all enhurs. The specimens are interest to insulher. This article is used in various for the use of dentities have a special control of for the use of dentities has uppeared to the Jury to combine all the deviated qualities of parity and malleshitity. Samples of platina, polladium, sinc, redminum, and its, in the control of the three of extreme thinness, show to how many different to the control of the control o The productions of Mr. Marshall combine all the conditions of evenuess and perfection in the work. The Jury award him the Prize Medal, Wild and Ronixsox, Oberstein, (Prussia, 889, p. 1097.)

The manufacture of articles in onvx and agate, in their antural state or coloured of various bues by artificial processes, has become a large branch of industry at Oberstein, In the collection of Messrs, Wild and Robinson are to be remarked two very beautiful flower-vases of black onyx, coloured, with natural white veins; two large cups of red chalcedony, coloured; large square links of chalcedoay, counceted together without joints, and alter-nating in colours, --very curious as regards both the work and the material; also a very beautiful snuff-box of green jasper. This remarkable manufacture claims at the hands of the Jury the Prize Medal.

BRAHMPELD and GUTRUF, Hamburgh. (54 Hamburgh, 1138.) A silver inkstand is exhibited by Messes, p. 1138.) A silver inssume is examined by the Brahmfeld and Gutruf, in the shape of an oak, at the foot of which are a stag and a doe; near them are two trunks of trees, cut horizontally, serving for the iak-bottle and sand-box. This work, which is the sand-box. The Jury award the Prize Medal, This work, which is cast, is elegans and

natural. The Jury award the Prize Medal, G. F. Haulick, Hainu (413 Pressia, p. 1073), exhibits a carnation in brilliants and rubies, with gold monutines enamelled green. This may also be ased as a pin for the hair. It is planted in a small vase of tarquoise blue eramel upon gold, with buttons of blue and red cnamel, and gold lions' heads bearing garlands; the base is ornameated with green and red oval-shaped ornaments. Prize Medal is awarded for the ensemble of this work.

STRUBE and Son, Leipzig. (33 Saxony, p. 1106.) A hurnished silver vase, its body encircled by earnations, and containing a bonquet of fifteen silver flowers, executed with so much lightness that they appear as if they had been produced by the same process as artificial flowers. This bonquet is an original work of Messrs, Strube and Son, and the Jury deem it deserving of the Prise

THE ROYAL PRUSSIAN IRON FOUNDRY, Berlin (271 Prussia, p. 1064), has contributed a large vase and two candelabra of cast iron inlaid with silver. The vase represents Alexander's entry into Babylon, after Thorwaldsen, and the candelabra support groups of Amazons on horseback and on foot. Judging of these articles as specimens of inlaying with silver, they are descrine of the Prize Medal.

KELER and Co., Oberstein, (888 Prussin, p. 1697.) The Jury award the Prize Medal to these exhibitors for their tea-service of coloured cornelian, consisting of two pots, a sugar-basin, twelve cups and sancers, twelve small plates, and twelve spoons; and for their jewel-cases in green moss-agate. The workmanship, the quality of these objects, and their unusual dimensions, are worthy of

attention and approbation, A. DUTERTRE, Geneva. (219 Switzerland, p. 1280,) The watch-cases, some in enamel, some ornamented with gold and diamonils, and two engraved gold plates, have attracted the attention of the Jury, who admire the delicacy and correctness of their execution. The gold plates, one of which represents an incident in the life of William Tell, the other a tree with a landscape backround, are engraved with extreme precision and delicary by Mr. Fritz Kundert; the tree, in particular, is of workmanship which will bear the minutest examination with a magnifying-glass. The Jury award N. Dutertre the

P. H. GRANDJEAN, Serrenoud, Chauxdefonds, Neochatel (46 Switzerland, p. 1269), exhibits a gold plate, upon which he has engraved, on a very small scale, a forest, which appears to be enpied from an engraving by Kolbe. Its execution is as fine as it is perfect, and has been awarded a Prize Medal,

A. Dunots, Chauxdefonds, Neuchatel. (43 Switzerland, p. 1269.) Another engraver, M. Dubois, exhibits a old plate, representing ornamental objects of fruit and gold plate, representing ornamental objects of these some flowers, placed upon a console table, supported by Atlanes, the whole in the style of Lepautre, engraved so finely that the plate at the first glazee resembles a photographic proof. The Jury award him the Prine Medal for this faultless work.

L. A. Golav, Seresche, Geneva (220, p. 1280), has exhibited a small sonvenir pocket-book, with cover engraved on white and green enumelled gold, with two modulions upon cnamel, one of which represents two Italian women playing with a child, and the other a landscape after Calame. The perfection of these enamels and their

beautiful effect merit a Prize Medst. J. Bennati, Geron (59, p. 1304). The Jury award the Prize Medal to M. Bennati, manufacturer of silver filigree work, for a statuette of Christopher Columbus

discovering a part of the globe by lifting up a veil which covers it. Notwithstanding the boldness of the idea of executing such a subject in filigree, he has shown so much skill and taste in overcoming this difficulty, that his success is surprising, and attributable to the clever arrangement of impererpible threads, imparting to the ensemble of the figure a form at once indecisive but correct

J. Louzo, Genoa, (58 Sardinia, p. 1304). Another manufacturer of fitigree, N. Loleo, has executed a column commemorative of the Exhibition, not very durable, but of very choice workmanship. The Jury attach more importance to the beautiful manufacture of trays, scentboxes, vide-pockes, sugar-basin with tray, eigar-cases, fans, baskets, and garlands for ladies' bead-dresses, which are of perfect execution, of very good taste, and have been rewarded with a Prize Meda

II. RATZERSTORFER, Vienna. (577 Austria, p. 1036). M. Ratzersdorfer exhibits a toilet-glass, the frame of which is entirely of massive silver, richly decorated with various ornuments, and with numerous groups and single figures. This frame, of elaborate and choice workman ship, merits, in the opinion of the Jury, the Prize Medal, D. Romain, Rotterdam. (104 Holland, p. 1148). The celebrated Dutch setters of precious stones are represented at the Exhibition by M. Romain alone, who has made a stomacher, consisting of a portrait painted in coamel and surrounded by a bouquet, capable of being divided into three parts, and very eleverly mounted in rose diamonds and pearls, for which a Prize Medal is awarded.

J. Falloise, Liège. (384 Belgium, p. 1163.) It is only a few years since the art of inlaying and damascening iron and copper has been revived in France, Spain, and Belgium. M. Falloise, of Lège, exhibits many different articles, to which he applies this description of decoration. Particularly worthy of remark are—a steel hracelet, with a bas-relief representing a Nereid in silver, with drapery of green and yellow shades of gold, mounted upon a dolphin, and standing out from the ground of inlaid steel in very high relief; two covered cups of copper (putine) inlaid with silver, in the Oriental style; three vases, in the Renaissance style, urnamented on the tray and the stem with flowers, foliage, birds, and masks, inlaid in silver, in relief and engraved; a steel chalice, upon which are aumerous tasteful ornaments in gold and silver, inhid and engraved. These remarkable articles entitle their maker to the Prize Medal.

E. Zuloaca, Madrid. (264 and 264s Spain, p. 1346.) Don E. Zulouga has exhibited arms, and a cover for a book, of iron and black oxidised steel, righly decorated with lea-reliefs and with damascened ornaments in gold and silver. The pistob, daggers, and sword are exactly of the same style as the book-cover; the latter, intended to the same style as the book-cover; the latter, intended to contain a Castilian title of nobility, is ornamested on one side with figure-subjects, on the other side with secutebeous and devices. The old Spanish models have served for patterns to all these works, in which the reuly-ture is deficient in grace and elegance, but its combination with a very beautiful damascening produces such a good effect, that artists are already engaged in copying thu articles exhibited by Don E. Zulcogn, to whom the Jury award a Prize Meda

Jann and Bolan, St. Petersburgh. 1377.) The Jury award a Prize Medal to Messre, Jahn and Bolin, of St. Petersburgh, for their beautiful exhibition of jewellery, as rich as it is perfectly set. especially worthy of notice are- A sparkling diadem, containing 11 very beautiful opuls, 67 rubies, 1,814 brilliants, and 1,712 roses,-a lancelet of turanoises and diamonds, and a brooch, in the shape of a knot, composed of 754 turquoises, with a pair of carrings of small turquoises, 709 in number. The settings of these latter objects are almost invisible. The execution of the jewel-

lery work cannot be better.
F. Dunand, 41 Rue du Bac, Paris. (1595 France, p. r. Denamy, 41 fare on mac, parts. (1375 France, p. 1253.) A Prize Medal is awarded to M. Dursnel for a ten-service, consisting of seventeen pieces mounted in stages, forming a pile of silversmith's work, supporting four tea-pots, as many sugar-basins, eake-baskets, and milk-jugs, all in silver, partly oxidised. The silver tenkettle is heated by a lamp. Around are four niches, with female figures; above the tap, between the niches, there are figures of syreus; in the lower niches there are other female figures. Small Triton Atlases support the milkings. The trays are inlaid with enamel, gilt and ornamented; the whole of the ground is in reported work, and richly ornamented. The models of the figures have been made by M. Klagmann, M. Durand exhibits besides a table centre-piece of silver, with infantine figures represeating the four seasons, water and wise, in the style of Louis XV.; and a racing-cup, with subjects relating to tournaments and caronsals in silver gilt, ordered by the late Duke of Orleans.

Obsor, —, 26 Ric Beese du Rempart, Paris. (1671 France, p. 256.) The articles exhibited by M. Odiot consist of large and medium-sized pieces of silversmith's work in the English style, and uf workmassing which this skilful silversmith deems best adapted to tableservices. All the pieces are of silver, mostly east, burnished, matted or engraved, and manufactured with care and solidity. The principal articles are-a large vase, with marine divinities, about 4 ft. 6 in. in height; the table-service of M, de la l'aboustère, all the covers of which are richly ornamented with sculpture of animals or of inauimate nature; an Arabian coffee-pot, with its fingums in burnished and gift silver; a chestant plate, representing a damask table-napkin; a coffee-pot chocolate-pot ornamented with spiral groovings, burnished and beautifully executed; a table centre-piece, representing a wild boar at low; a large candelabrum, with bacchinalian figures; fine specimens of knives, forks, and spoons, &c. The Jury award the Prize Medal to the

exhibition of M. Odiot CHABLES CHRISTOPLE and Co., 56 Rue de Bondy, Paris. (1562 France, p. 1251.) Messes, Christoffe and Co., who are licensed to work the patent of Mr. Elkington, exhibit a valuable collection of silversmith's work in conner laid down, as to articles of every-day use being made of electro-plate, are applicable to all the exhibitors who have had recourse to this process, and the Jury can make no exception in favour of Messra Christofle. They award the Prize Medal to the ornamental articles only which these manufacturers exhibit, such as a centre-piece repre senting Capids fishing with a net around a group of trunks of trees, and candelahra, in the same style, of

agreeable and animated sculpture. CONSTANT VALES, 161 Rue St. Martin, Paris. (707 France, pp. 1212-13.) The Jury have noticed with satisfaction the artificial pearls exhibited by M. Constant Vales, who displays great skill in overcoming the difficulties of workmanship, and producing a superior inita-tion of untural pearls. They award to M. Constant Valès

a Prize Medal. BOULLETTE, HYVELIN, and Co., 46 Rnc St. Avoy-Paris. (1107 France, p. 1231.) The articles exhibited consist of beantiful artificial stones tastefully set, amongst which a stomscher in diamonds, pearls, and emeralds is especially worthy of notice. These manufacturers make the materials themselves, and work for exportation. The Jary award them a Prize Modal.

Taveny, E., 18 Rue du Petit Lion St. Sauveur, Paris. (1045 France, p. 1228.) M. Truchy confines himself especially to the manufacture of imitation pearls, and makes remarkable imitations of those called black pearls,

for which the Jury award him the Prize Medal.

F. Daratque, 8 Rue Jean-Jacques Rousseau, Paris (1575 France, p. 1252), exhibits a collection of jewels, 202 Praise, p. 1223; extunits a contention to green, and conceived, suitar, brothes, and depending of polyclamonic union, with metall and cosmo dorsaments,—a happy intion, well carried out, and for white the Jarry award.

N. Lacarriers the Princ Medal.

P. V. ULERWENS, 57 Bee Saint Avoyc, Paris. (1707

Praise, p. 1223). The principal pit broases manufestered

N. S. Navan, 22 Rose Saint-Gilles, Paris. (1476 Praises,)

N. Willemens are a tehernache, basing estamble on the hracelets, chains, brooches, and especially of polychromic cameos, with metal and enamel ornaments, -a happy invention, well carried out, and for which the Jury award him a Prize Medal.

p. 1246.) This exhibitor cultivates a peculiar branch of manufacture, that of plating gold on red copper. In order to obtain it cheaply, his plates undergo a very accurate process of stanging in steel matrices, which are engraved with great accuracy; and they come out so perfect that they only require to be put together, which M. Navard does with extreme skill. He exhibits miniature frames, bracelets, brooches, and the most delicate orna-ments. The Jury award him a Prize Medal.

SAVARY and Mosnacu, 2 Rue Vaucanson, Paris. (368 France, p. 1194.) The imitation stones of Messrs Savary and Mosbuch comprise samples of various descriptions, executed as well as possible, especially their imitation diamonds. The emeralds, and particularly the sapphires, are hardly so perfect, but hitherto manufacturers have been unable to attain perfection in this description of stones. The settings are in very good taste, and very carefully executed. The Jury award them a Prize Medal,

F. A. Thouser, 31 Place de la Bourse, Paris. (1702) France, p. 1257.) M. Thouret exhibits various articles of silversmith's work in copper electro-plated; but the Jury exclusively notice among the productions of this man facturer the objects of art obtained from autique models with great exactness by means of the electrotype process, such as the Cup of Fulda, and the one representing the lance of the Sabines: perfectly clean moulds, taken in gelatise from the originals, have served to reproduce these charming models in copper deposited by electricity; the deposits are beautiful, and are silvered and gilt. The Jury have also remarked a beantiful cover for a primer, produced by the electro process, ornamented with subjects from the Obl and New Testaments, with superimposed medallions. The Prize Medal is awarded to M. Thouret. Avcoc, -, sen., 6 Rue de la Paix, Paris. (1052 France, 1229.) The beautiful fittings for travelling cases, exhilited by M. Aucoc, containing very important articles of silver and silver-gilt worked in the English style, are worthy of particular notice, and have been awarded a

Lebolle Faines, I Rue de la Chanssée des Minimes, Paris. (1318 France, p. 1239.) The articles exhibited consist of bronzes, clocks, candelabra, groups and figures mostly gilt, and silvered in parts. Their display of arti-cles is considerable, and nothing which they have sent has been made for the occasion. The Jury, though observing in the predections of Mesers. Lerolle Frères a certain

degree of negligence of style, deem them nevertheless deserving of the Prize Medal

Mtnor Faènes, 10 Rue d'Angouléme-da-Temple, Paris. (646 France, p. 1209.) A considerable assortment of decorative articles in zine and alloys of common metals, bronzed, gilt, or silvered, constitutes the exhibition of Messrs. Miroy Frères. This branch of industry places within the means of all classes, and at very low prices, ornaments of rich appearance, such as statuettes, candelabra, clocks, &c., &c., the greater part of these figures are cast in reverse, the broazing, gilding, and silvering, being obtained by the electro process, the effect of which is remarkable in this description of articles, wherein it is desirable to combine effect with economy. The Jary award them the Prize

V. P. BOYER, 38 Rne Saintonge, Paris. (70 France, 1175.) The Jury award the Prize Medal to M. Boyer p. 1175.) The Jury award the Frize oreals to the gold is for his bronze figures electro-gilt, in which the gold is very well couplayed, exhibiting fine, burnished, dead, and confirm of in junitation yellow, and green gold in targe surfaces, or in imitation

of damascening. A. Lacarriere, 9 Rue Saint Elizabeth, Paris. (1284) France, p. 1238.) Amongst the imitations of precious metals there are two large candelabra in cast-iron, partly hroused, and partly gilt with varnish, exhibited by M. La-carrière. These caudelahra, adapted for burning gas, of large size and very beautiful execution, are exceedingly good imitations. The same manufacturer exhibits beautiful gas-fittings well put together, gilt by the same process as the candelahra, adapted very skilfully to ornamental

door and on the rose-work, in the Gothie style,—a ewer with tray, in which the ear-ed work of the helmet and shield of Francis I, is introduced with great ability and judgment,—also two candelates with branches, the bases of which are ornamented with the trophies of the Porte 81, Deails, very ingeniously arranged and silvered. The Jury award the Prize Medal to this exhibitor.

L. D. J. Artsort, et Bue Biobelion, Paris. (11 France, p. 170). The testing-time of the Princest Wolkonski, manufactured by M. Audot, are of the princest Wolkonski, manufactured by M. Audot, are of cograved silter, and of very good workmanship. The same establicter shows a very beautiful vace, with triple form, the proport and landles gift, with over- and follings in releft, and gift in three colours. The fittings of another drawing-teste are entirely of waved silver, ainfail with examel and damacenced, has ting a very good effect. These was the control of the prince of the Prince Medical, within he availed to M. Audot.

C. S. MATTATA P Rue de la Petre, Paris, (228 France, pp. 1224). As a monifecture of gift broaten, M. Meinich has sought torvel, varied, and elegant forms, and has been the property of the pr

A. Tucxuty, 44 Boulevard Roumarchais, Paris, (696) France, p. 1212.) The Jury award the Prize Medal to M. Thoumin for his stamped brass furniture ornaments. The rough patterns of the articles exhibited are placed just justaposition with the finished samplet, in order that the precision of the stamping may be appreciated. The finished comments are lackered in a colour much resembling gold.

A. R. PAYEN, Jun., 18 Boulevard Saint Denis, Paris, (1674 France, p. 1237.) The jewelley is intended for exportation, and composed with much taste. This exhibitor naskes filigree work after the manner of the Indians, and employs to advantage numerous real pearls of small size. The Jury award a Prize Medal to the intelligent workmantship of M. Payen.

The state of the s

LEVY FRÉRES et Co., 76 Rue des Fossés du Temple, Paris. (595 France, p. 1206.) The workmanship of these exhibitors, without making pretensions to an elevated is

fir above an ordinary character. They produce in their own manufactory all their gift broarce, which they use for the decoration of porcehin mounted by them with much propriety and richiness. Turquisoi-blue procedum of subjects in the style of Watton is exhibited; and the Judicion manuser in which it is mounted in highly-orannouted gift broarc, deserves the Prize Medal awarded by the Jury.

A. Wercaxa, 148 lice Vielle du Temple, Paris, (210)
Prance, p. 1213. The blue procedul uses, mounted with
gill benus, representing Syran, and the clock representing
Agriculture, m. gill troute and irvey, exhibited by M.
Weygand, render him deserving of the Prize Nodal. The
work of these articles is generally in good laster necesticles the architecture of the polestal of reagreem on
a beautiful conduction of gold and twey, in our satisface
tory. The remainder of this collection contains some
proving garage tomore, whight the Jary regret it in our

within their province to notice.

A. CARON, Passage de l'Opéra, Paris (1133 France, p. 1232), gunsmith, exhibits pistols very richly silvered, gilt, and damascened. Tho Jury award M. Caron thu Prize Medal for this portiou of his collection.

Mocrina an Panel, II Bue Echelies, Paris. (1864) France, p. 1943. The days award a Prize Medal to M. Mouire I Page for a lunting-knife, the bill of which is commencted with a goomed representing an learning include enablescend with a finer in red enumel, accompanied by knife of pends and armed with pedales calles with silver points; the shield in surmounted by a steel before with a reli wranth and erest. This work is executed in peld of various colours, hidult to a great depth on a need core, and the colour of the pendicate or free effects were the fineless of the properties of precedence with the discovered and the period of precedence when the period of the period

P. Praklat, 41 Rue de la Ferme des Mathurius, Paris, (1681 France, p. 1257.) The arms exhibited, particularly the pistols, are embellished with gold damaseciating, and gilt relievo ornaments. The quality of his work entitles this exhibitor to a Prize Medal.

this exhibite to a Tirm Sodal Montinoreus, Paris (111). Prance, p. 1623), manufactures a variety of articles, units as fur parses, officeorrieles, boxes indial with ename, pocket-companion, recut-bottles, eight-cases, with representations, result-bottles, eight-cases, with representations, result-bottles, eight-cases, with representation of the control of the cont

d — Letaceners, 37 Ros Visione, Paris, (1308 France, p. 1239.) The Jury awards Frize Medal for the beautiful gold mounting of a entinc; for a double-serve plate for a gun, ornamented with dogs, inlaid and semptured in ogold, after models by M. Lechene; and for the fine galvanie riding of his weapen.

 Descontaines, of the house of Lenoy et Fils, Pulsis National, Paris. (1186 France, p. 1234.) M. Desfontaines exhibits a clock and a set of ornameuts for the chimneypiece, which present a novelty in the material employed for the sculptures. The bodies of the clock, and of candelabra vases which accompany it, are of dark-blue porcelain: all the ornameuts and fittings are executed in east-iron, polished and damascened in gold. The clock is organiented with a composition representing five knights struggling for the oriflamme, one of whom is nuhorsed a very animated scene, and executed with talent, caudelabra vases are surmounted by a figure of St. Michael in armour, holding in his hand a drawn sword; on the handles are two knights combating with dragous; and the feet are formed of three lions, with bats' wings: this work, taken as a whole, the effect of which is highly satisfactory, must have presented great difficulties of execution, which M. Desfortnines has surmounted in a happy mauner, while the indicions employment of the gold relieves the harsh colour of the cust-iron. The Jury award the Prize Medal. The Jury of Class XXIII, make HONOURAULE MENTION of the fullowing Exhibitors, their several claims to which are indicated after their names:

LISTER and Sons, Newcastle-upou-Tyne. (27, p. 676.)

Silver plate for ten and coffee-service: a brooch in blue connel with fleur-de-lis-Kilip and Soss, Newcastle-upon-Tyne. (3, p. 673.) Silver plate for table-service, and candelabra. M. McGanton, Perth. (46, p. 680.) A ram's head

richly ornamented.

RETTE and Sons, Aberdeen. (24, p. 675.) Bracelets of Aberdeen and Peterhead granites: Scotch icwellers. MARSHALL and Soss, Edinburgh. (23, p. 675.) Cup, chatelaine, and bracelets in agate. CARTWRIGHT and Illinois, Ihrmingham. (30, p. 676,)

Silver plate for the table. E. and J. Sevyora, 40 Gerrard Street, Soho, London

(72, p. 682.) Portraits upon enamel of the Queen and Prince Albert. HEXRYS and Co., 2 Budge Row, London, (131, p. 694.) Imitations of diamonds, pearls, and precious sto

E. Matthews, 46 Berwick Street, Soho, London. (95, 686,) The Royal Arms of England engraved upon mes on a luckground of tin, in impatition of coansel. E. Nasu, 30 Coppice Row, Clerkenwell, London. (86, (83.) Suuff-boxes in dark tortoiseskell, inlaid with

gold "de burges" and "pique. W. Morr, 36 Cheapside, London. (116, p. 693.) Pencileases and pea-holders in various styles,

J. MAYER, 68 Lord Street, Liverpool. (14, pp. 674-75.) Blue enamelled gold brooch in the form of a knot of ribboo; a necklace in gold, formed of a chain-work of scales, with medallion with three emeralds and two bril-

liants S. WERTHELMER, 35 Greek Street, Soho, Loudon. (Class XXVI., 177, pp. 746-47.) A bronze casket, gilt, pierced, and stamped: an inkstand ornamented with slabs of painted chins and with gilt mountings,

SMITH, NICHOLSON, and Co., Duke Street, Lincoln's Inu Fields, London. (119, p. 691.) Silver flower-stand. R. Attannonovan, 19 Piccadilly, London. (113, pp. 692-93.) A plain ten-set gilt in the inside: a set of soms and forks in the style called the Paxton pattern: bracelets in the form of a cross; one of them in brilliants upon gold and dark-blue enamel, the other in rubies upon

dramonds and tarquoise-blue enamel, W. Baran, 72 Argyle Street, Glasgow, (26, p. 676,) Rum's head righly mounted, the ornaments being silver

II Witkinson and Co. Sheffeld. (44, p. 680.) Large pieces of silver plate and table ornament Window on and Veale, 73 Strand, London. (100, p. 690.) Rings mounted with fice stones: a lundeau of

diamonds with an enerald in the centre: a green and red enamelled curb-chain necklace with pendants,
G. Asukll, 51 Compton-street, Clerkenwell, London.

* Professor Jears Changeon, Proxy for M. Frison.

THE limits to which the Reports of the Juries must necessarily be confined will admit of a very brief and eursory sketch only of the rise and progress of this manufacture

Its origin is uncertain, and has been ascribed by some of the writers of antiquity to accident. Josephus claims the discovery for the Israelites; Pliny assigns it to the Phonicians, and states that the first glass-loones were erected in Tyre, where the only staple of the manufac-ture existed for many ages. Herodotus and Theophrastus likewise confirm the fact of the use of glass hewing becu known in the earliest periods of civilization, and of the establishment of works for its fabrication in Egypt and Phoeniein, and even in India, where rock crystal was em ployed in its composition. It is mentioned in the book of Job, "Hast thou with him spread out the sky, which is strong, and as a molten looking-glass?" But possibly this expression may have been intended, in the original Hebrew, to refer to the metallic speculum. The Egyptian philosophers had made chemistry their

study, and attained to a very high degree of profesency in that science. They involved it in the same mystery as they did their religious rites, and elainsed for it from the people the same respect as for an institution of divine origin; and it is not surprising that they should have discovered in the prosecution of their researches, the simple process of vitrification, resulting from the action of intense heat upon siliceous particles, enphined with alkaline salts; and that they should at once have perceived the facility of working the malleable substance thus produced, which possessed the quality of becoming hard and transparent as it gradually cooled This fact once established, their artistic skill, with the

aid of science, could not fail of edvancing another step, and of availing itself of the means of conveying form and colour to the shape, and of dealing with it for purposes of ormment and utility; as we see exhibited in the few beautiful remnants which have been brought to light in the exeavations of modern times, The process of manufacture, detailed by Pliny in the

curious and interesting chapter of his "Natural History. (lih, 36, cap. 25,) oppears to have been very much the same as that practiced at the present time: and Sir same as that preserved as one proceed tomes awarent Gardner Wilkinson (vol. iii, page 99), gives the repre-sentation of two gluo-blowers inflating a piece of molten metal, by means of hellow tubes; taking from a painting of Beni Hossan, executed during the reign of that monerels, who lived about 3,500 years ago, and adds, "That merca, who rived about 3,340 years ago, and adds, "That glass vases, if we may trust in the representations in the Theban paintings, are frequently shown to have been used for holding wine, as early as the Exodus, about 1,490 years before the Christian era." The remains of Alexander the Great are said by Suctionis and Sarabo to have been delivered to Augustus, when he was in Egypt, in a glass case, in which Sciencus had deposited them after removing them from a golden urn. This substance is supposed to linve been pard by

Archimedes for scientific purposes, and an urb of glass is mentioned, as having been constructed by him, which gave rise to the epigram put into the mouth of Jupiter by Claudian-

Jupiter in parvo enm cerneret athera vitro, Rish, et ad superos talia dicta dedit. Hucelne mortalis progressa potentia curse; Jam meus la fragili luditur orbe labor! Jara peli, rerumque fidem, legesque virorum, Ecce Syracusius transtulit arte Senex l

There is in the British Muscem a perfect and beautiful goldet, excavated by Captain Layard from among the ruius of Nineveh. It has a name (probably that of the contemporary sovereign, or of the maker) engraved upon it; and from the characters employed, and the locality in which it was found, it is believed to be of a date not less recent than seven centuries before the Christian era, and is probably the most ansient piece of maenfactured glass in existence. The Barberina, commonly known as the Portland Vase, likewise in the British Museum, and broken u few years ago by a fool, or a madman, shows the perfection to which the art was carried at a some what later period,

The commercial intercourse of the Phomicians and Egyptians with the islands of the Mediterraneau, and with Etruris, extended to them, and even to more reregions, the use of this material. But it was not till the reduction of Egypt imparted to the Romans a more intimate knowledge of the arts practised in the conquered country, that the use of glass became general in Italy,

and formed a very important article of commerce.

In the reign of Tiberius, works for the manufacture of glass were first established in the neighbourhood of Rome, and many instances are given by the writers of the day of the estimation in which it was held, and of the enormous sums occasionally paid for vases, or goblets of that substance, which were preferred by many to those made of the precious neetals. It was employed by them not merely as an article of luxury in their feasts, or as an ornament in their palaces; but it served to decorate their altars, and for a pions offering in the tombs of the dead. Many fragments have been found in the catacombs, showing it to have been used likewise by the early Christians

in their places of worship.

How far glass entered into the common purposes of donestic economy does not clearly appear; but it has been described as having been employed in the construction of hollow columns in the theatres, in which lamps were placed for the purpose of illumination; it was likewise used for incrustmion of the walls of apartments, instead of marble; and to this use the expression "vitrese enmere," some commentators have considered that ex-pression as referring to windows. But there is no positive authority for the use of glazed windows earlier than the close of the third century, when they are alluded to by Lactuatius, who compares the researches of the mind with the operations of the eye, regarding external objects "per fenestras lucenti vitro, aut lapide speculari ob-ductas." St. Jerome ulso mentious windows, formed of meited glass, cast into plates (a.p. 422).

A sheet of glass is said to have been found a few years ago in a window-frame at Pompeli, but the fact does not appear to be very well authenticated, and at all events it can only be one of very rare occurrence. After the removal of the seat of empire to Hyzantium, the arts suffered amidst the disturbances and confusion which prevailed in Italy during the decline of the Western Empire. Constantine had assembled around him all that could tend to the cultivation of art, and the embellishme only that to the constraint of any and the cabinets of our days some few specimens, showing the perfection to which the manufacture of glass was carried in his time, and that of his immediate successors,

Venice, according to her early writers, had been in ssession of the art of glass-making almost as early as the foundation of the city itself; but the capture of Coustantinople (1204), in which she took so great a part, and the extension of commerce which this event afforded her, induced her wealthy merchants to avail themselves of their jucreased relations with the East for the improve-

ment of their domestic manufactures As early as the beginning of the 13th century, glass had been a subject of special attention to the Venetian government, and was regarded by them with so much care, as to have been, according to Carlo Marino, " in ogni tempo considerata dal governo, qual pupilla degli occhi suoi." The trade and manufacture of this article increased so rapidly as to require a large number of additional buildings for currying it on, and great measuress was excited among the inhabitants, lest fire might accidentally occur among them. In 1291 they were in con-sequence removed from the city, and the island of Murano was assigned by the government for their reception Considerable privileges were, at different times, accorded to the merchants of Murano, with the view of adding importance to their operations. A separate jurisdiction, independent of all the authorities of Venice, excepting the supreme council, was granted to them; and a libro d'ore, in which the most eminent members of their guild, or fraternity, were registered, placed them io a position equivalent to that of the nobles in a monarchical state, But, on the other hand, they were subject to very

stringent regulations. They were prohibited, under severe penalties, extending to their families, and even to their relations, and involving the loss of life and property, from conveying to any foreign country the secrets of the manufacture, or the materials employed; or even from affording their own individual services, by which the competition of foreigners with the trade of Venice might be promoted. An immense trade in beads, initiations of pearls and of precious stones, was carried on with the coasts of Asia and of Africa, and extended to India and to Chian; and continues by means of the commercial intercourse of England with these countries to the prescut

The revival of art in Italy had a beneficial effect on the manufactures of Venice, and improved the design and the colours of her produce. Her mirrors, her tableglass of variegated colours and spiral stems, her bottles and cups, obtained a very high reputation, and became the source from which the wants of Europe, Africa, and

Asia continued for a time to be supplied,

But, in the 15th and 16th centuries, events occurred which greatly affected the prosperity of Venice. The Hope, and the discovery of America, changed the whole system of European commerce, and threw open to Poringal and to other States the advantages which Venice had almost exclusively enjoyed. England and Holland had forced their way into the Levant trade, up to that period monopolised by the Venetians and Geneese. The policy of Solimus, who, after the capture of Constantinople (1453), endeavoured to turn the commerce of the East into channels which he could control, or from which he could derive advantage; and the loss of Candin and of Cyprus, operated still further to the disadvantage of Venice. The mystery in which she involved all her transactions, and the severity of her fiscal arrangements, by which she endenvoired to preserve her monopoly, impeded her own progress, whilst her exclusive system excited a spirit of competition among her neighbours, which rendered them successful rivals; and her own commerce and manufactures, assailed and undermined in so many different quarters, were rapidly giving way. Her trade in glass suffered with the rest; and Bohemia

Germmuy, France, the Netherlands, and England, derived advantage by the dissolution of the Venetian monopoly, by the improvement of their established manufactures, or by the introduction of a new process into their respective States; where, to this day, the works of the artists of Venice are still adopted as models of great beouty and skill, inferior only to the still more perfect productions

of ancient Greece and Rome.

Bohemia was the first to emancipate herself from a state of commercial dependence upon Venice, and to resort to her own resources for her supply. Her forests afforded fuel and potash in abundance; silex and lime of excellent quality were to be found in the immediate neighbourhood of her existing works, and probably led, in the first instance, to the introduction of an improved system into that country; giving the manufacture an im-pulse which, combined with skilful manipulation, caused it to make rapid progress in the peculiar qualities requisite

The Bohemian proprietors having no other means of obtaining a return for those resources, which abounded on their estates, were induced to support the manufacture by their own exertions, and even to embark in the trade themselves. They have thus been embled to bring into the market a beautiful article of commerce, and to compete successfully with countries possessing larger capitals, but where a higher price is paid for labour, and where many of the substances used in the manufacture require to be imported. The Venetian origin of their craft shows itself to this day in the reticulated pattern, the Eastern forms, the taper stem, and the variety of colours. Their colours, and engraving, and imitations of precious stones are likewise very beautiful; but at the best they are but an imitation of Venetian art,

Bohemian glass is a silicute of potash and lime, and has no lead in it. The manufacturers of that country make use of the same materials in the construction of the with this exception, however, that for the last 25 years they have been using sulphate of soda, instead of potash, for osaking commun window-glass. The same combina-tion of materials prevails generally throughout Germany. The manufacture of glass had probably been introduced into France at the same date us into Germany, and had been practised for common purposes from the earliest been practised for common purposes from the contract centuries of our era. Both countries derived their know-ledge of it from the Romans; or probably from their commercial intercourse with the East, improved by the Romans, and still farther advanced in quality and artistic ornamentation, adopted from the Venetians. But it was not till a later period that France sought to increase the supply of her own demands, by paying greater attention

metal, whether employed for window-glass or mirrors;

to her manufactures at home.

As early as the fourteenth century, her government, with the view of inducing persons of education and capital to enter into the business, had declared that occupation to be in nowise incompatible with the dignity of the aristocracy, and decreed that none hat gentlemen should venture to engage in any of its branches; and, as late as the latter part of the seventeenth century, the glass-blower might be seen laying aside his cocked hat, ress-coat, and sword, to prepare for the performance of his daily work. Other important privileges were granted to the manufacturers, and confirmed by a Royal Charter of Incorporation. But as education and capital became more generally diffused, those exclusive privileges were found to be injurious to the prosecution of trade, and have from time to time been modified; they still, however, remain in sufficient force to have an injurious effect upon the operations of the manufacturer and the merchant, and the convenience of the public. Privileges of this nature were no slouht intended for the promotion of trade, by holding out advantages to individuals disposed to apply their capital and industry in the pursuit. But the import duties, which afforded protection to the speculator, were likewise resorted to by the government, in order to assist the revenues of their States; and whether a sort of patent right were conceded to the speculators, or import duties were imposed for the purpose of checking foreign competition, the result was the same, --iojary to the manufac-turer, and inconvenience to the public. The fiscal regulations affecting glass to the reigns of James and Charles were of this character; and the excise and customs' duties in England, imposed at a later period, proved still more objectionable.

The first tax on glass was imposed 6 and 7 William and Mary, subjecting all glass wares manufactured to England. or imported from fareign ports, to a duty therein prescribed. It was shortly afterwards reduced to one-half; and in 10 and 11 William III. "it was totally repealed, being found to be regations, and troublesome in the levying and collecting, and of small advantage to the Crowo, and, if continued, it would lessen the duty on coals emplayed in the manufacture, throw great numbers of poor out of work, and endanger the loss of a manufacture so beneficial to the kingdom."—Parliamentary Reports, 1835. In the latter part of the reign of George 11, an attempt was made to renew the tax in a somewhat different form, but it was again found occessary to modify it. Several Acts were passed in the reign of George III., which not only added very coosiderably to the duties weighing upon the home manufacture, but likewise established regulations relating to the process of fabrication, the thickness and weight of the articles manufactured, and the powers and duties of the officers employed, which, in addition to the pressure of the tax, were particularly disadvantageous in a business "which necessarily depends for its success on the application of scientific prisciples to the various combinations of the materials, which are used, either as fluxes, or to form the basis of the product; and especially to the due regulation of heat, both as to its intensity and to the due regulation of near, oon as to its intensity and duration." A uniform system of regulation, prescribed by Act of Parliament, and executed by officers, who, how-ever well meaning, were generally ignorant of the details of the business, could not fail of being vexatious, and of operating to the detriment of the manufacturer.

The 6 George IV, extended the duty to Ireland, the

immediate consequence of which was a great and general depression of the trade. The primary intention of the excise laws was to secure the due payment of the tax, and to establish checks both on the nanufacturer and ou the officers employed in levying the tax; but they likewise assisted one branch of the manufacture at the expense of another. For instance, a severe restriction was inposed on the bottle and crows-glass trade; the object of which restriction was to promote the use of fliot-glass, which is prepared from much more costly materials, and was charged with a rate of duty jouch higher than that on bottle glass. The repeal of the excise laws removed the restriction, and was consequently more advaotagrous to the manufacturer of bottle and crown glass, than to the persons engaged in the manufacture of flint; as the former were thereby enabled to supply a much chesper article than flint glass, for all those purposes in England to which this material is adapted, as is the case in three countries where excise regulations do not exist. gobletterie on the Continent (including phials and small glasses) is usually made of crown-glass, and is much cheaper than in England, where the pressure of the tax impeded the manufacture; so much so, that in many instances in England bottle and crowo glass were manufactured of such good quality, as to lead to the strong suspicion that their improvement must have been effected by the use of materials not authorized by law, and couseently not consistent with the protection afforded by But there were other that law to the flint-glass trade. provisions of the statute equally injurious, and which led o evasions in the highest degree disadvantageous to the legal trader, as well as to the revenue. The most considerable advance is duty took place in

1812, and the immediate effect on consumption was as follows:-The annual average quantity of glass of all kinds, made far home use during the three years enling in 1812, was 413,414 cwt.; the average of the three following years cading in 1815, was 264,931 cwt., showing a decrease of about 35 per cent, in the quantity nude. In the quantities retained for home use in 1793, when taxation was comparatively low, and in 1829, there was a decrease of 9,626 cwt., notwithstanding the great in-erease of population, and the advance of civilization made

during the interval by all classes.

So much has been written on the anhiest of glass, that it would be merely a repetitino of the able and interesting information given in the different Encyclopedias, and in the many treatises on the history and manufacture of glass, if io our Report we attempted to do more than briefly allude to the details of the ounufactore. But it is important to bear in soind that the basis of all glass, at all times and in all couetries, is the same-silex and alkali, two apparently opaque bodies, which by their fusion pro duce a transparent result.* The alkali acts as a flux, and facilitates the vitrification of the earthy particles, which separately are unvitrifiable; and gives to them a pliability, wheo hot, which admits of their being blowo, wrought, extended, and even hammered. It is remarkable that the glass found by Mr. Layard at Nineveh, now in the British Museum, bears the marks of having been turned, a process seldom attempted by the modern artists, though the applientino of the grinding tool, fixed on a lathe, approaches

to the practice.

To the silex and alkali other substances are added, for the purpose of facilitating the flux and of purifying that metal, and imparting to it some peculiar quality or colour. Metallic oxides are employed for this purpose. The oxide of lead, in the form of ninium, is principally used in flintglass, and increases its brilliancy, the purity of its colonr, and the power of its refraction. Manganese, formerly koowo as glass-makers' soap, is also in general use for the purpose of clearing the glass of all colouring matter. Its effect may probably be ascribed to the facility with which it gives up its oxyges, which combines with the colouring priociples and destroys them. But very great care must

^{*} Where sand is used, it is found, on examination with u microscope, to comist chiefly of small rough, rock crystals, which, by the action of alkali and fire, are aggregated and

be taken lest the remedy, applied for the removal of one I ain principles dependent upon science, according to which description of defect, should give rise to others of an opposite character. The presence of too much alkali attracts humidity, and (to use the glass-makers' phrase) disposes it to sweat. It also dispuishes the refractive power of the glass, and when used in the state of nadecomposed sulphate of soda, or potash, renders it opalescent. Lend in excess will produce equally lud effects: it will soften the substance of the glass, affect its clearness, and, in course of time, render the surface liable to be altered and decomposed. The importance of lead in this manufacture, whether in the form of lithage or of mininm, which is obtained by oxidizing litharge, is so well understood in England, that very great attention is paid to its preparation, as well as to the quality of the is one cause of the excellence of British flint-class.

Bonx, white arsenie, and nitre, are also useful, and powerful agents when well applied; but danger may arise from the employment of arsenie in vessels intended for domestic use. Borax, or borate of soda, is too expensive to adoit of its being employed for common purposes. It is, therefore, far from being generally adopted, and is applied rarely even to objects of great importance. was formerly imported from India, being a product of Thibet, but in a very impure condition; and a better sort in the form of borneic acid is now supplied from the works which M. de Larderel has established at Monte Cerboli, near Volterra, in the Tuscan Marconne. ascertained the presence of large quantities of boracie acid in the district, he ubtained a grant of land for a term of years from the Grand Duke, and immediately commenced operations. He began by diverting a stream to the spot where the borneic acid was found to abound; and after the water had become impregnated with the acid, it was allowed to fluw on through pipes to large pans, for the porpose of evaporation. Vulcanic heat likewise prevails in the same district, and in order to avoid the expense of fuel, which M. Larderel found extremely high when he first undertook the works, he has availed himself of this volcanic agency, and conveyed the heat in tubes, so as to make it pass onder the pans, by which means the evaporating process is effected, and the borneie acid remains in the rans.

Notwithstanding the facility afforded by this natural agent, the manufacturers complain of the high price of agent, the manufactures company of the fight price of this substance, about 54. less the metrical quintal (205 English lbs.). The price is said to be regulated by a contract, made with some merchant at Leghorn; but it has the effect of excluding the material from the manufacture of glass for dumestic purposes; and it is likewise to be observed that the Tuscan boracie acid, even at this price. contains nearly one-half its weight of water of ervstailization; so that the glass manufactorer has to pay at the present day nearly is, per pound fur the material in its available form as a flox. There are, also, other objections to its employment; for it is so extremely pungent that, unless applied with great caution, it corrodes the nots, introduces alumine into the fased metal, or passes away

through the pores of the vessel. It is said that this material has been found in abundance on the western coast of America, in combination with lime, as borate of lime; which, if correct, will be of essential service in many branches of manufacture. It is described, for the first time, by the American mineralodescribed, for one first time, by the American insugran-gist, Hayes, and has been called Hayesine, from its dis-coverer. It is met with in the Peruvian province of Tampara, not far from the port of Iquique, in the same locality where the nitrate of soda, now so extensively exported to England, has been found. The borate of lime contains nearly 45 per cent, of boracie acid, combined with 19 per cent, of hime, and 35 per cent, of water, substances which cannot deteriorate its quality as n flux whilst its moderate price, white colour, and absence of any metallic oxide, render it well suited to the use of the glass emeible

The first chemists in England, France, and Germany have directed their attention to the fabrication of glass. Experiments have been tried by practical working men. with great liberality and intelligence; but there are cer-

all operations connected with the art must be directed. It is to the accuracy and judgment exercised in adhering to these principles, in providing for the selection and application of the component substances, in determining their proportions, and secoring their purity and quality, in the working of the metal, the construction of the furnaces and the pots, in the management of the fires, and the annealing process, that we must look for the production of a good composition, and for improvement in the art of glass-making.

The silex mostly used in England is sea-and, consisting chiefly of quartz. The finest qualities are obtained from Alum Bay, in the Isle of Wight, and from near Lynn, on the coast of Nurfolk, Black flint, when raised to a red heat, and plunged in cold water, is frequently used, and probably gave the name to the species of glass, flint-glass,

or crystal, to which it is most commonly applied.

The alkali used in this manofactore is either seda or stash, which is preferred for the finest works in the con dition of the carbonate, and is then called carbonate of potash, or pearl-ash, from which the carbonic acid is ex-Soda is used as dry carbonate of soda, when a more than ordinary degree of whiteness is required, as in plate-glass. It is also used in this state in coloured glass. In window-glass crown and sheet) soda is more generally used as a sul-

phate of sods. Colour is imported to glass by the application of the metallic exides, and when it pervades the whole mass is termed pot-metal, as distinguished from that to which the

colour is applied in the form of enamel.—(See Coloured Glass.)

Cobalt produces hine. Manganese produces violet, Antimova produces vellow

Procipitate of cassius, or gold, produces pink, Uranium produces opalitie-greenish coloor.

Chromium produces green. Copper produces ruby, or greenish blue, according to its degree of oxidation

Copper with iron produces ruby, or green, according to the degree of oxidation of the copper, Silver produces a pure and beautifol yellow, but only hy staining the surface at the fire of a muffle.

These colours, however, will be modified, or even completely altered, by different combinations of the metals, the degree of their oxidation, the greater or less degree of heat employed, the addition of vegetable earbonneous matter, and other circumstances.

The manufactore of glass has been chased by the Commissioners nader the following heads:-

- A. Window-glass, including-
 - 1. Crown-glass.
 - 2. Sheet. 3. Brown plate, silvered or unsilvered.
- 4. Colonred sheet, pot-metal, or flashed. B. Painted and other kinds of ornamental windowglass
 - C. Cast plate-glass. Rough plate. Pressed plate. Rolled plate. D. Bottle-glass, including -Ordinary bottles, Moulded bottles. Medicinal bottles Water-pipes and tubing.
- E. Glass for chemical and philosophical purposes. Natrass-retorts, &c., &c. Water-pipes and tuhing.
- P. Flint-glass, or crystal, with or without lead; white, colonred, ornamented, for table-vases, &c., &c .-
 - 1. Blown. 2. Nonided and pressed,
 - 3. Cut and engraved.
 - 4. Reticulated and spun with a variety of colours incrusted, flashed, enamelled of all colours,

opalescent, imitation of alabaster, gilt, platinised, silvered.

- 5. Glass mosaic, millefiori, Aventurine and Venetian glass weights.
- Bends, imitation of pearls, &c.
 Canadeliers, candlesticks, apparatus for lamps.
 Optical glass, fliut and crown,
 Hough discs of flut and crown, to make lenses
 - Rough discs of fliut and erown, to make lenses for telescopes, microscopes, daguerreotype and
 - enlotype apparatus, &c.

 2. Flint and erown, blown, or east in plates for the optician.
 - Thin glass for microscopes,
 Refractive apparatus, prismatic lenses for light-houses,—(See also Class J.)

houses,—(See also Class J.) Section A.—Window Glass, &c.

It has been observed before, that some degree of ancertainty pecusits respecting the period when this description of glass came into general use. It was a firstregarded as an article of incurry used splendour, and representations of the state of the state of the state France about the sixth century. Fortunatus of Politers, who was contemporary with Gregory of Tours, mentions it in his Latin poeus, as doing known to the hishops of his day, by whose care the Curriers had been this sup-

his day, by whose care the channels had leven um suphardering in blead printfers shilled in making glass were invited into England by Albot Beschet, in the Warmansh and Yarma were glassed and aborted by his care. dates from the sixteenth century, greatly facilitated the manufacture.

There are two methods of making this description of

glass:--

By the cylindrical process (sheet-glass).
 By the effect of centrifugal force (crown-glass).

In the first, as soon as the fund metal is in a condition for working, a sufficient quantity is collected at the extreor of the control of the control of the control of the below at the same time, dil it scapitres the form of a labtor place of the control of the control of the theoretic of the control of the control of the theoretic of the control of the control of the theoretic of the control with a function of the control of the with a function of the control of the control of the control with a function of the control of the control of the control with a function of the control
By the second operation, the glass collected at the end

of the tube is made to assume the form of a flusk, or rounded lump; and then, by a rapid rotary motion, the centrifugal force causes it to acquire the shape of a large circular alacet, about 50 laches in diameter. The thickness of this glass is nearly equal throughout, except at the knot or bullion, formed at the centre, where the rod

or tube was attached to the metal.

The cylindrical process is the ooly one referred to by
the monk Theophilus, as being la use in his time, whose
wark, entitled "Diversorum Artium Scedula," was written
about the ead of the twifth or early in the thirteenth

This mothed was principally engloyed by the Vereitars, and was found to prose the advantage of inserting unimal was found to prose the advantage of inserting uniquest produced to the control of the control of the congressive equality of their thickness. But as the domain for colored glass of their thickness. This state of the manufacture continued till the beginn ing of the eighteent contray, when a Proche officer, time of the eighteent contray, when a Proche officer, Proce. W. Dobestura formed a compare for this purface. W. Dobestura formed a compare for this purparation, and the state of the process of the proches. In the process of the process of the process of the number of the process of the process of the protain and hose, in 1720. They carried on their works with no much success, the being small to involve the Lind, to make success, the being small to involve the Lind, to make a success, the being small to involve the Lind to make the process of the process of the protain of the process of the process of the protain of the process of the prompts, the protain of the process of the propagation of the process of the dead principle, in the Lyopania, in the north of Praces,

in Belgium, and latterly in England, The first workmen, bronght over from Bohemin, had been induced in leave their country by the offer of high wages, and fearing a diminution of the advantages which they sujoyed, in the event of competition, they entered into a combination for confining the business exclusively to their own families. They constantly refused to allow strangers to be taken into the establishment in which they worked, or even to give them instruction; and if a maste attempted to break through this regulation, the whole establishment would throw up their engagements, and leave him unprovided with workmen competent to curry on the business. They thus transmitted their occupation from father to sou; and the names of Schmidt, Zeller, Theber, Walker, Stenger, Huy, Mayer, &c., employed in the manufactories of France, even at the present day, testify their German origin. A similar practice prevailed to a certain degree in England, where the stlass-maker's trade is likewise a very exclusive one; and the benefit societies, of which the workmen frequently are members. reader it exceedingly difficult for the masters, even if willing, to depart from ancient practice, and attempt amendments, which are looked upon by the workinen as prejudicial innovations. Another evil of a very serious nature has also arisen from this system of exclusion, which has been more particularly felt since the alteration of the excise and customs' duties. This measure, and the consequent reduction in the price of glass, have caused a great increase in the demand; and the supply of workmen in this country, properly educated and trained for the nice and difficult process required of them, is so limited, that the manufacturers have found themselves unable to execute the orders, from want of hands connectent to enrry them into execution. Consequently, they have been obliged to resort to the Continent, and to bring over workmen to assist in the works, which can only be accom-

plished by means of increased expense in wages. The great advantage of sheet-glass, obtained by the eviludrical process, is that of affording plates of larger dimensions, and of avoiding the waste arising from the circular form of the crown tables, and from the knob, nr half-seye, in the middle, where the metal was attached to the tube. But the surface is much less brilliant than that of erown-glass, and is more wavy and undulated. The manufactories of glass in plates, in France, Idejum

The manufactories of guass in panels, in France, Jesgellin, and the north of Holland, where the six let of building required panes of large size, were in consequence gradially abundoused, and towards the close of the last cuntary, a unanufactory of that description near Abbaville, in Normandy, one in Hanover, and two others: near Aschaffenburgh and Bamberg, were the last in which this process in the construction of window-glass was used.

Crown-Glass.

In England, on the contrary, the manufecture of glass on tables, under the name of crowing place, had attained to so great perfection in the quality of the metal, vortunal-properties of the properties of the pr

plass to the purposes to which the latter was applied in this country.

This served to projudice the public against all gloss made upon the cylindrical principle; and it was not mult the year 1832 that the manufacture of cylinder or sheep glass was introduced into this country upon the principle.

generally adopted upon the Continent.

It was then introduced by Messrs. Chance and Hartley. of Smethwick, near Hirmingham, whose attention was specially called to the advantages attending this mode of manufacture by a visit paid in the year 1830 to the manufactory of M. Bontenns, of Choisy-le-Roi, near Paris. They were struck with the saving effected by the roctangular shape of the sheets of glass obtained by this process, and especially by the absence of the bull's-eye or knot in the centre, which rendered it impracticable to obtain, out of the tables of crown-glass, pages of greater superficial measurement than about one-third of that of the tables themselves; whereas, in sheet-glass, the panes could be obtained of the full size of the sheets blown, and the only limit to their dimensions was the strength of the workman; much greater facility being, moreover, afforded for accommodating the dimensions of the sheets to those of the frames required. Considering these advantages more than sufficient to counterbalance the disadvantage nuder which sheet-glass laboured in respect of evenness mid brilliancy of surface, and taking into account the facility afforded by this process of manufacture for making glass shades (for covering clocks and other ornaments) which had hitherto been almost entirely imported from the Continent, and having secured the valuable co-operation of M. Boutemps, these gentlemen determined to commence the manufacture of sheet-glass, and started their first furnece in the autumn of 1832. They had, however, many difficulties to contend with, which it required all their energy and practical and commercial experience to overcome. The partnership was dissolved in 1836, and the following year Mr. Hartley established a manufactory for erown-glass at Sunderland. Not the least of these difficulties was the excise duty upon windowglass, which was at that time very heavy (amounting to nt least 300 per cent, upon the cost of the glass itself), and being levied upon all the glass manufactured, whether ood or bad, much enhanced the cost of experiments; and good or bad, much enhanced the cost of cap-had it not fortunately happened that some advantage was allowed, in the shape of drawback, upon that portion of the glass which was exported, this obstacle might have

proved insurmountable.

The waviness of the surface of this glass proved, as
war anticipated, a great obstacle to its introduction for
general glazing purposes, excepting in such cases us those
their products is shighly appreciated.

in which surface was of no moment, and strength the chief quality requiries; and it was not multi the year chief quality requiries; and it was not multi the year in the control of the co

The manufacture of broad or spread-glass was continued for many years after the introduction of sheet-glass, with which it was able to compete, in consequence of a difference in the rate of excise duty which was levied upon it; but this difference having been done may with in the year 1843, and the duty capatized with that most absentor in the contract of the of its inferior quality; and the manufacture was slarify after a bindows.

It was not so with the manufacture of glass shades, which, as le-fore mentioned, was introduced at the same time, and by the same firm, as that af sheet-glass, and which has keep larse with It, and increased to a very great extent; and it has likewise undergone much improvement in the quality. The shapes have been shaped to the taste of size than were ever made on the Continent, to the almost entire exclusion of those of foreign manufacture, with

which his nurker was supplied until the year 1832. In the year bits, new variety of animorpius was not help politic which they chained from thereights by a new year of printing and polsibility. This improved process has, within the last few years, been introduced into France by Messrs, Patoux and Co., of Aniche; and has been successfully established, though upon a comparatively limited scale.

If the temperature, america exact, one plane, which was decired from view, has never been dependent from, nor replaced by the new for and plane. They are not, however, or replaced by the new for and plane. They are not, however, on the control of
SECTION B.

Painted and other kinds of ornamented window-glass have been assigned to this Section, but will be reported on elsewhere.

SECTION C .- Cast Plate, Rough Plate, Pressed Plate, Rolled, &c.

Notwithstanding the encouragement afforded to the manufactures of glass of these descriptions in France, their progress does not seem to have been very rapid, until the ministry of Calbert, when some French artists who had been employed at Murano, and become thoroughly cognizant of the method of making blown plate-glass adopted in the Venerian manufactories, conceived the project of introducing the art into their own country.

They were taken up and warmly supported by Colbert during his ministry, and established works at Tourfavilier, near Cherbourg, its 1688, in a situation resembling that of Murano, as nearly as possible, which they imagined to be calculated to promote the success of the enterprise.

We over to Alarham Theorat, a verhige muinfesterre, the process of existing the metal, flood in the glass pots, of the anadicture, he at one provided the advantage of the anadicture, he at one provided the advantage to be deried flow it is producing glasses of these flumtions are provided to the property of the advantage to the provinces and chaining a pixet, validation that the government, and chaining a pixet, validation that the government and chaining a pixet, validation that we are the property of the provided that the provinces and the second of the provinces of the provided that the provinces and his noociates had to entate with much opposite and his noociates had to entate with much opposite and his noociates had to entate with much opposite and to the provinces of the results of difference by untiling under a common charge of incorporation. The company of St. Querin, which had been the flat to make sheel-plane on the eyindirect phencipal in France, was not backward in adopting the great improvement in the process of cauting with their other works. Their lease from the monks of St. Querin explored in 15th, but can be such as the state of might arise from the competition of a rival company at tableshment at Circy, in the eighborhood of St. Querin, which, after the lapse of the term, merged in their more rever establishment at Circy.

The two great manufactories of St, Gohain and Circy, for a time, continued in opposition to one another; but a new enterprise entering the lists against them, the two long-established companies, without actually forming a partnership, cutered into an agreement for their mutual advantage, and used a common depic for the sale of their produce, and for regulating the price in the different markets.

Another company established works at Nonthqua host three years ago, and has sent some of their glast shout the Exhibition. Their recent establishment does not afford them a large stock from which to select the best produce, that the difficulties of a commencement, there is every reason to loop that, with time and encouragement, they will not fall short of the high reputation which no deservedly attacks to this branch of manufacture in

sincers for the admission of objects thisming to compact for the Medals, and on terming that an unexp feeling prevailed on the subject among those exhibitors who had with the subject among those exhibitors who had with the original triversion of the Commissioner, and who consteaded that it would not be just that the Freech planes, nelected from a large store after the Directors planes, nelected from a large store after the Directors been so long in the Exhibition, should be pixed on the same festing, the Sc. Golania and Circy exhibitors, with a mederation which did them honour, consented to withductions, without claiming the require.

lu England, plate-glass, for mirrors and couch windows, had been jutroduced for the first time by the second Duke of Buckingham, who brought over workmen from Venice, and established a manufactory at Lambeth, where the works were carried on with success. The great improvement which had taken place in the process in France, and more particularly the important inventions of Thirart, found their way to England; and the first manufactory for east plate was established in 1773, at Ravenhead, near Prescot, in Lancashire, hy a society of gentlemen, to whom a charter was granted, under the name of "The British Plate Glass Company," under which title they still enjoy a high reputation, though their firm, their capital, and their privileges, have undergone considerable alterations. When this company was first established, the only east-plate manufactory was that in France, supported by the government; and all the processes of grinding and polishing were done by hand labour. In 1788 this company ordered of Messrs, Bolton and Watt, of Birmingham a steam-engine, which is believed to have been the second ever erected; and in the following year they commented the machinery for grinding and polishing. They were thus the first to introduce machinery for bringing their work to perfection, and the example was followed by all the other companies. It is remarkable that though many attempts have been made to improve the machinery, it remains, in all the manufactories, without any alteration of its principle. The glass produced by this company is tinged with a slightly-like colour, which they attribute to the fact of their avoiding the use of the metallic oxides in their metal: and consider that this practice gives hardness, brilliancy, and transparency to their glass, and admits of a finer polish; and they assert that their glass is not liable to the change of colour which occurs when arsenic, lend, or mauganese are employed. The gluss which is exhibited by this company is placed in the

The establishment at South Shields, founded by the Cookans, in 1728, likewise added the process of entiring to their existing works. A very considerable business Swinshmen, who have supplied several large glasses for the decentrion of the Building, and point out one in the furniture department, number in the Catalogue No. 4, as exhibited a dome of opaque white glass, large tablets of glass, coloured in institution of marchi, and a great variety glass, tolkered in institution of marchi, and a great variety glass, coloured in institution of marchi, and a great variety glass, coloured in institution of marchi, and a great variety glass, coloured in institution of marchi, and a great variety glass, coloured in institution of marchi, and a great variety glass, coloured in institution of marchi, and a great variety glass, coloured in institution of marchi, and a great variety glass, produced in institution of marchi, and a great variety glass, produced in institution of marchi, and a great variety glass, the produced produced in the produced produced produced in the produced
of other objects composed in plate glass.

The rough plate glass of Messr. Hartley, of Sander-land, likewise belongs to this section. A great variety of articles are manufactured by them; but it is this notful product that they particularly specify as the object contributed by them to the Exhibition.

The Thames Plate Glass Company was established in 1835-6 at Blackwall, and have exhibited two glasses of very large dimensions.

Two others in Lanneabire, and that at Smethwick, nore flyrmingham, have all been brought into existence within the last half-entury, and considerably increased since the repeal of the existe laws. Their joint produce now exceeds two millions of square feet annually, which are used, first, in the shape of cough plates, for glaring, for roofing-in the trailway stations, skylights, and other similar purposes.

similar purposes; seconary, as potisted gains, for shop windows, and large plates, for the windows of houses. The process of casting is much the same as that employed by Thevart; but where manual labour was formerly used in the grinding and polishing, the use of nuclinery now assists the operation, and has led to a diminution in the cost of production, and consequently to increased consumption.

Section D.-Bottle-Glass, Water Pipes, and Tubing. The manufacture of bottles is of very considerable importance, from the amount und value of its produce. In France alone, the trade is estimated at above 60 millions of bottles annually; and their value at more than half a million sterling. The earliest and one of the than half a milhon sterling. The earliest and one of the most important manufactories of this species of glass

was established in 1294, at Quinqueogroue, in Normandy The lottles used for the effervescing wines, and for utaining cotain acids, require very great care in their fabrication. In the former, it is necessary that the component parts should be thoroughly mixed, when the mass is in a state of fusing; and that the glass should be uf equal thickness throughout, that in every part the bottle may be equally storing, and able to resist the pressure of the fixed air confined within,

The loss of bottles by bursting, in the champagn trade, is stated to amount to from 21 to 30 per cent.; and a machine has been invented for testing their strength, which ought to be equal to hear the pressure of from 25 to 35 atmospheres. The price of bottles for this purpose to 35 atmospheres. is generally nearly double that for ordinary purposes. In bottles intended to cootsio acids, care should be taken to combine chemically the alkali and the lime, so as not to incur the risk of their being acted upon by the acid, and subjected to decumposition.

SECTION E. - Glass for Chemical and Philosophical Purposes.

The glass to which this section refers requires peculiar qualities, according to the purpose to which it is to be applied. Ha, doess, evaporation of the salts by a lang-continued exposure to heat, but which cannot be effected without deteriorating the colour, are the most essential qualities for glass of this description; and will bring it under the heads, partly of buttle-glass, and partly of flint-glass. Several other products, useful in the slairy, the farm, the garden, &c., may be referred to this section.

Secretox F .- Flint-Glass, or Crystal, with or without Lead,

The glass comprised in this section is derived from the remotest antiquity. Among the excavations which have been made in Egypt, Greece, Italy, &c., are found fragments of blown-glass, moulded, pressed, ent, engraved, mosaic, reticulated, &c., and adorned with cameos of the finest workmanship. Venice and Bohemia followed in the same branch, and were only surpassed by the substi-tution of a metallic oxide in the manufacture, and the production of a silicate of lead and potash, in lieu of the silicate of potash and lime to which they still adhere.

The first manufactory of flint-glass in England was established in the Savoy House, in the Strand, in 1552, established in the Savoy House, in the Scraud, in 1992, and another in Crutched-Friars; but it was not till lung afterwards that the great improvements which have brought it to its present state of perfection, by the use of minium, or oxide of lead, and closed pots in the furnace, were introduced.

In 1635, Sir Robert Mansell obtained a natent for making glass of this description, in consideration of his nudertaking to employ pit-coal, instead of wood, in his furunces. He was also granted, on the same grounds, the exclusive right of importing drinking-glasses of fine quality from Venice, which were not made in England till half a century later.

The use of coal was soon found to affect the colons of the metal; closed pots were then used for the purpose of obviating the evil, but from their use arose another objection. The fusion did not take place in the closed objection. The fusion did not take place in the closed nots so rapidly as when the metal was more immediately exposed to the action of the fire. A larger supply of alkali was required to assist the fusion, and the colour was still affected. This led to the adoption of a metallie flux, and the oxide of lead was applied in as large quancolour. This new process not only remedied the evil, but has been found to produce glass of the purest colour, most brilliant effect, and most perfect in quality of any yet made.

This method of fabrication was not so much required on the Continent as in England, wood being principally used as feel in the furneers. It was not till 1784 that the metallic oxide was introduced in a small factory at St. Cloud. It was afterwards removed to Munt Cenis, near Autun, which possessed the advantage of coal in the neighbourhood, and was known as the glass-works of the Queen, and continued its works till 1827.

Another manufactory of crystal, or silicate of lead, using wood fuel and open pots, was established in 1790, at St. Louis (M-selle). It has continued to carry on a very extensive business during the last thirty years, and only yields in importance to the glass-works of Bacarat, which were purchased in 1816 by M. D'Artigues, whose works at Voucsch, near Namur, had become, by the Trenty of 1815, a part of the Belgian territory, and who preferred to curry on his business in his own country

The coloured glasses of Bohemia, of which Count Harmeh, Count Schaffgotsch, and others, have exhibited very beautiful specimeos, and their imitatious in Germany, France, and England, are comprised in this section; and likewise the mille fiori style of work, adopted for making presse-papiers and other ornaments, and sold by hundreds of thousands, which, by the extent of the trade, have become a very important branch of manufactore.

The description of glass referred to in this section sustains the high reputation which it has earned, and is ably supported in the Exhibition by the products exhibited by the Oslers, the Pellatts, the Powells, the Richardbited by the Oslers, the Penatts, see Possess, and many other exhibitors. The American glass sous, and many other exhibitors. It is a silicate of protoxide of lead, and is remarkable for the parity of its

Section G .- Optical Glass, Flint or Crown,

The properties which are usually considered as constituting excellence in glass for ordinary purposes may easily be attained; but in glasses intended for optical instruments, and to be employed in the examination of objects so remote or so minute as to require the most undeviating accuracy, the difficulty of obtaining the metal sufficiently free from the defects to which glass is incident, had hitherto bufficil every attempt to produce a lens, except of very small dimensions.

Purity, unchangeableness of colour, transparency, and a certain degree of refractive power may be obtained; but perfect uniformity in the structure of the glass, so as to render its composition absolutely homogeneous in all its parts, is not so casy to be accomplished; and it is precisely this quality which is the most indispensable in the manufacture of optical glass, The great difficulty seems to occur in the difference of

the specific gravity of the several constituents of the metal: some melt at a lower temperature, and sinking through the mixture, leave a streak or trad in descending: some evaporate or decompose in a beat required for the fusion of others; and different substances cool at different temperatures. Hence arise discoloration, aweating, threads, globules, strire, irregular crystallization, which cause irregular refraction by the interruption of the mys of light, and their deflection from the course which they ought to

The discovery of the achromatic telescope has been of the atmost importance in the science of astronomy. first idea is due to Galileo; but Euler, in recent times, applying his mind to the investigation of the came of frequent failure in the construction of the telescope, adverted to the perfection of the arrangement of the ery talline bummurs of the eye, bestowed by the bounty of Providence on man, which are so disposed as to provide for the variation in the different rays of light, and draw them to one focus; and he imagined that glasses of different media might, on the same principle, be so adapted to one another as to correct and regulate the distities as the fusion would bear without an alteration of persive powers of the different rays. But the experiment

In 1753, John Dollond directed his attention to the same object; and, aided by the co-operation of Euler, and of Kliogenstierns the Swedish mathematician, he succeeded, after a long series of experiments, in discovering the due proportions of the curvatures of the two lenses, of which the object-glass of the achromatic telescope is composed; the one being flint-glass (silicate of white lead and potash), the other, crown or plate (silicate of soda and line), which, having different refractive and dispersive powers, may be so arranged, that while, by the comhination of the two, the rays are brought to a focus, the rester dispersion of the flint lens may be corrected by the less dispersive power of the plate; the one being negative, the other positive. "The refractive power of the glass beads the rays of light fulling upon, or rather entering its surface, according to a certain law, in which it proceeds through the medium, while the glass is of the same kind. The same occurs again when the ray, having passed through the lens, arrives at the other surface an passes into air, the ratio here being the inverse of the former."- Eacyc. Met.

Hence srises the importance of avoiding any variation in the media of which the glass is composed; as the slightest difference would act as a disturbing cause to the progress of the ray of light in its due course, derange the refraction, and distort the object.

reinferind, and untook une buject. Dellored and the After this principle was attained, Dellored and the After this principle was attained, Dellored and the course of the property of the dellored of their purpose, The Academy of Sciences, at Paris, offered prints in value for this object. The celebrated elemints, Macquer Boxx, of St, Gobnin, and Anut, of Langres, devised their attention to it in vain; and even when processed, 3 to 3½ inches in dismeter was the largest size they could obtain.

M. d'Artiques, me of the first mannfesturers of crystal (fint-glas) in France, and who to his high reputation for practical skill added that of scientific knowledge, equally ailed, or produced insufficient results; and it, remained for a man in no degree conversant with science, tot a glusmaker by trade, nor distinguished by elacation, but endowed with extraordinary energy, spirit of inquiry, colution of the influence of the control of the control of solution of the difficulty.

Guinand des Brueets, near Noufebatel, a workman in the clock and watch trade, who had heur accrusioned to the fusing of metals in the prosecution of his hashess, observing that in the odinary process the waving and the removed by stirring and thoroughly mixing the metal by means of an iron bur, applied the same process to flinglass, and combining it with close attention to the attration of the same process of the complex of the composition of the comtraction of the composition of the comtraction of

strie.

M. Utzachaeider, of Munich, hearing the result of his experiments, on making further inquiry, proposed to him to join him and M. Francohoffer in their establishment at Munich: he accepted the offer; and one of the largest plasses resulting from their experiments, the diameter of which is 9 inches, is now in the Observatory at Dorpat.

Guinard returned to his own country, but not being a gloss-maker by profession, he prosecuted his reconscient discovered the process only at intervals. He had discovered the principle; he had careed a well-envired reputation in the world of had careed a well-envired reputation in the world of results of his experiments had not attained to certainly in practice, and he had not overcome the difficulties in the fabrication of crown-glass, which requires the asset in the fabrication of crown-glass, which requires the asset finite.

In the latter years of his life, Guilanad entered into communication with the Astronomical Society of Loodon, and sent over some dises of flint-plass, of which Mesus, Dollood, Herschel, and Pearson made a favourable report. The largest of these plasses was 6 inches in diameter; and it is remarkable, that in England, which had supplied the Continent with flint-plass, a dise of 6 inches should have been regarded as a rarity. Som after, a Commission, composed of Mesers. Heredel, Dendays, Dabella, and Beget, was interested to prove Frankey, Deballa, and Beget, was interested to prove Frankey took the lend, both is his own hidoraticy and at the phase-work of Pinners. Pellatt, and could not find of restance of the Pinners of the Pinners of Pinners of Pinners or mentackles proving. The Lords of the Transary had restackles proving. The Lords of the Transary had since the Pinners of the Pinners of Pinners of Pinners in favour of the Diquil Society, or person actuing from similar proposes made that holy. But, not writing the debty in obtaining the necessary Hence, proved so controve and Encouracies, in a completely to haddle their controvers and finners were the province of the Pinners of the necessary of experiments and the questions at to the fairteness of experiments and the questions at to the faircasion of finning-base figurity typoson in Pinners and

mems of experiment; and the question as to the haircation of fins-place being actively pursocal in Funce and cation of fins-place being actively pursocal in Funce and Shortly afterwards M. Gainand died, without leaving, any information as to his process. But in Havrais, the works in which he had taken part had been continued according to his system; and his wife and two sous had witnessed his experiments, and were derivous of availing themselves of their father's invention for their own in themselves of their father's invention for their own in

evolved by M. Diguest, of Solverts, who has sent to the Exhibition some of his products to incoderate size, not pure in rother (14-54 silps); but they prove the diffithere is the size of the size of the size of the size there are even tone impoliments in fibricating revenglass of large size, than in making good crystal. In order to reader it free from importly, it becomes most offer to reader it free from importly, it becomes most another to reader it free from importly, it becomes most acceptance of the size of the size of the size of the societies. It requires a higher temperature. By increasing the finity of fusion, the disposition to struct hamility, on to overs, it is greated. In readering it too in cooling, it increases all the size of the incoding the size of the

The insecurity in which political events in France involved the pervous engaged in industrial pursuits was experienced by M. Boutemps: he contended against it, however, till the year 1848; when, after attaining to a high degree of emincoce, and receiving the decorations which are awarded in that country to distinguished merit, he was induced to retire from the difficulties and dissensions which prevailed around him, and to accept the invitation of Messrs. Chance, Brothers, and Co., to unite with them in the attempt to improve the quality, nod extend the utility of this important branch of manufacture. They have succeeded in producing discs of extraordinary dimensions in flut of 29 inches in diameter, weighing 2 cwt., and of crown-glass up to 20 inches. These discs appear to be pure in colnur, good in structure, and exempt from those defects which tend to polarization of light, &c., and were considered by the Jury of Class X., Sir David Brewster, Sir John Herschel, Lord Wrottesley, and others, to be so important, that they invited Mesers. Chance to submit their disc of fliut to the operation of grinding, finishing, and other processes, necessary in order to ascertain the uniformity of its density through-

* Since the above was written this remarkable disc has been subjected to the tests required is order to prove its

Mr. Ross, the celebrated uptician of London, was the first to call attention to a defect, which may be detected by polarization of light; and there is no doubt but that many failures, which had occurred previously, were to be attributed to the absence of this searching test. A glass, exceeding only the small diameter of 6 inches, undergoes the annealing process with difficulty, and is liable to cool at the surface more rapidly, than in the interior; and this tendency increases with the size, which renders the production of a disc of 29 inches a very remarkable work In this section are comprised the optical glasses of M. Maos, of Clichy, which have been distinguished by the award of a Council Medal (see p. 532), and likewise the annular lenses and cylindric refractors, which are applied in the construction of lighthouses, according to the principle introduced by Augustin Fresnel. Buffon in the last century, and Sir David Brewster in our own times, had recognized the advantage resulting from the arrangement of lenses in separate pieces, having a enumon focus. Fresnel, without being aware of the exertions made by Sir David on the subject, submitted, in 1822, to the French Commission on Lighthouses, a plan for sub-stituting, along the coast, lights on this principle, and introducing the refracting apparatus instead of the metallic reflectors then in use

In 1814, Mr. Alan Severous was sent to France to compare the tenical argumans with the paradoidal compared to the paradoidal arguman and the paradoidal for the paradoidal arguman and the paradoidal compared to a larger scale, of which not is rehilled by Messer, Chance, The sets of light have likely the born contracted on a larger scale, of which not is rehilled by Messer, Chance, and which the contracted to a larger scale, of which not is rehilled by Messer, Chance, and which the contracted to a larger scale, of which not is rehilled by Messer, Chance, and which the contracted to a larger scale, of which not is rehilled by Messer, Chance, in which the contracted to the compared to

quality; and if it is found not to be liable to humidity, the colour is certainly much in its favou The apparatus contributed to the Exhibition by Messrs. Chance was constructed at their manufactory, ander the superintendence of M. Tabouret, formerly employed in the department of the Ponts et Chansses in France, who, after thirty years of practice under that Board, had accepted the invitation of Messrs. Chance to direct the manufacture of the dioptric lighthouse apparatus, which they were desirons of establishing at their works. They they were desirons of establishing at their works. They have exhibited a dioptric apparatus of the first order, with remarking lenses and catadioptric sones, constructed on the principle of Present. The npper and lower parts of the apparatus consist of a series of prismatic rings, each of which reflects, at the luternal surface of its base, the incident rays of light. The advantage of this mode of incident rays of light. The advantage of this mode of reflection over the ordinary system of opaque reflectors consists in its saving a considerable loss of light, and being less liable to imperfection of surface. The middle portion of the apparatus is refracting, and produces by its revolution a succession of flashes or blazes of light, which may enable the mariner to distinguish any particular lighthouse. The revolving part consists of eight annular lenses. Each of these lenses is composed of a number of concentric rings round a central lens, so as to produce all the refractive effect of a single solid lens of correspond dimensims, but with less loss of light. A more perfect optical figure is moreover given to these compound lenses than to a single piece of glass, spherical abortation being in some measure corrected, and lenses of larger size may thus be formed than could otherwise be practicable. The glass used in the apparatus now in the course of adoption in the lighthouses on the coast of Scotland is made in France, and it has been alleged that it is liable to attract

quality: and its merit has been so satisfactorily established as to justify the Jury of Class X. in recommending that a Council Medal be awarded to the mannfacturers.

minister or "n weat," and consequently to love a portion of its heightons. But her Pracular manniturers deep the charge; and when the judgment and cure manifested the charge; and when the judgment and cure manifested to the consideration, a strong presentagetion is affected that the commissioners and Mr. Servenson as yet find the Presch the contrary options to be correct, it sold press to the Petith associations of the overall press of the pression of the contrary options to be correct, it sold press to the Petith associations of the principle in the place made a fact experience with the view of promoting disc branch of experience with the view of promoting disc branch of exact the deep of the pression of the pression of the size of the pression of the pression of the pression of the size of the pression of the pression of the pression of the size of the pression of the pression of the pression of the deep of the pression of the

The question of lightheness does not properly come upon to absert to the apparents in the Exhibitor, of which the glass from sometical part, we cannot quilt question to absert to the apparents in the Exhibitor, of which the glass from sometical part, we cannot quilt question to the properties of the part of o

The Eddystone, 23 miles from the Run's Head, on the coast of Corwall, was erected of timber by Winstanley in 1696-88, and washed away in 1703. It was rebuilt by Rudyard in 1706, and destroyed by fire in 1735. Tha present edifice was erected by Sineaton in 1737-78 present edifice was erected by Sineaton in 1737-78 present edifices were need in the first instance for the lights. In 1807 argand harmers and paraboloidal reflectors of silvered copper were substituted.

The Bell Rock Lighthouse, commanding the line of approach to the Firths of Forth and Tay, constructed of stone by Mr. Robert Stevenson in 1807-10, is too well known, and reflects too much honour on his name, to require any further notice.

The most remarkable work on the coast of Ireland is

The most remarkable work on the coast of Ireland is that of Carlingford, near Cranfield Point, erected in 1830.

The Skerryvore Rocks, about twelve miles south-west of Tyree, off the coast of Argyllshire, lying in the track of the shipping of Liverpool and of the Clyde, had long been regarded with dread by the mariners frequenting those seas. The extreme difficulty of the position, ex-posed to the unbroken force of the Atlantic Ocean, had alone deterred the Commissioners of Northern Lights from the attempt to place a light upon this dangerous spot; but in 1834 they caused the reef to be surveyed, and in 1838, Mr. Alan Stevenson, their engineer, inheriting his father's energy and scientific skill, commenced his operations on a site from which "nothing could be seen for miles around but white foaming breakers, and nothing could be heard but howling winds and the lashng of the waves." His design was an adaptation of meaton's tower of the Eddystone to the peculiar situaing of the waves," tion-a circumstance with which he had to contend. He established a circular base 42 feet in diameter, rising i a solid mass of guess or granite, but diminishing in diameter to the height of 26 feet, and presenting an even, concave surface all around to the action of the waves. Immediately above this Ievel the walls are 9.58 feet thick, diminishing in thickness as the tower rises to its highest elevation, where the walls are reduced to 2 feet in thickness, and the diameter to 16 feet. The tower is built of granite from the islands of Tyree and Mull, and its height from the base is 138 feet 6 inches. In the intervals left by the thickness of the walls are the stairs, a space for the necessary supply of stores, and a not uncomfortable habitation for the three attendants. The rest of the establishment, stores, &c., are kept at the depôt in the island of Tyree. The light of the Skerry-vore is revolving, and is produced by the revolution of eight annular lenses around a central lamp, and belongs to the first order of dioptrie lights in the system of Fresnel, and may be seen from a vessel's deck at a distance of 18 miles. An arrangement of apparatus of considerable importance has been suggested by Mr. Thomas Stevenson, whereby true lenticular action may be extended by the adoption of total reflection for that end, arrangement, combined with the use of spherical mirrors. he has been enabled to use all the light of a lamp, and he has therefore termed it a bolophotal system. Much has been done of late hy the English, the Scotch, and the Irish Boards for the improvement of the lighthouse system; but the interests of commerce and of humanity require that much more should be done, as the funds set apart for this object will permit, in order to afford still greater security to vessels approaching our coasts; and we trust that the British manufacturers will not be slow in availing themselves of the opportunity of supplying a material of the very best quality for this important object. In a sketch of this nature, it is for obvious reasons extremely desirable to avoid anything like a comparison

CLASS XXIV.]

extremely desirable to avoid anything like a comparison between the products of different countries or different intervals but it manifest younge within the rogar of position of the principal establishments which have conposition of the principal establishments which have controlled their productions to the Exhibition; and to take rounded to the production of the Exhibition; and to take rounding the production of the Exhibition; and to take constitus, which have, at express much inconvenience to themselves, intrusted their property to our care, and condition in the property to our care, and condition in the property of the condition of the controlled in our imparatially and patient in determining to in the properse of this moleratality, we have felt as increasing seaso of the importance of the subject, and of the increasing seaso of the importance of the subject, and of

the responsibility arising out of the task. We have felt that the contributors might reasonably desire a more detailed description of the products which they have contributed to the Exhibition, and of the art to which they have applied their intellect, their resources, and their industry. But our limits are necessarily restricted within narrow bounds, and we fear that we have already trespassed upon the Commissioners and the public, further than the object, intended in calling for Reports from the Juries, fully justifies. But we must plead in our excuse the interest and importance of the subject—an interest which we have felt growing noon us as we proceeded; and though we are aware that the subject has frequently been well and ably treated, yet we trust that in pointi ont some novelties and improvements in the art, to which recent practice has given rise, we shall obtain forgiveness for exceeding in some small degree the limits assigned to us. In the remarks which we feel ourselves called npon to make, it has been our most anxious desire not to wound the feelings of any exhibitor, still less to do him an injury in his trade by any observation of ours, applying to his We have endeavonred to confine ourselves to general principles, not to point out defects; but to leave it to the exhibitor to judge for himself, whether our prin-ciples are correct, and whether he has acted in accordance with them; and if not, to amend his practice, and entitle

himself to commendation on some future occasion. There are, hovever, point as i suce to which it is extraord. There are, hovever, point as i suce to which it is extraord to a succession of the point of the contract of the area of th

With respect to the first question—the composition of the metal—upon this mast depend the merit of the glass, and consequently its value. The combination of as much brilliancy of refraction with as perfect purity of colour as can be obtained is the object desired.

By some manufacturers, parity of colour is sacrificate to brilliance of efrancius; by others, the reverse in the case. The real object, the just a silice, can only be the case. The real object, the just a silice, can only be the materials employed; and this can only be the result of careful experiments, and the study of the effect of careful experiments, and the study of the effect of ratiosa chemical combinations. The expedient or retended to the case of th

In some descriptions of glass the defect of colour is negative than in electric. In alterna precisis hose, the apparent than in electric. In alterna precisis hose, the superior of the superior of the colour importing to the object reflected a persion of its colour descriptions are proposed to the plant. The Provis had the Registat have paid great structions to this electromatonic, the superior of the glast. The Provis had the Registat have paid great structions to this electromatonic colour plant in the Exhibition, and of the Belging glass, shad not the opportunity of exhibiting them, we should also the opportunity of exhibiting them, we should also be a shad to be a shad of the provided approxition of the properture of the properture of the prolate law makes in the art, and a very perfect article of the Default, the frequentioned pressure of transition in Rapidal, the frequentioned pressure of transition

extended its influence over this species of these vertex of the consequence of in bids price, was not in very great demand and the removal of the evil combode the manuscript of the confluence
We reply, that we are informed the precise of the Crey and St. Goldmann immediators in a beep a very power of the control of the control of the control control of the power of the control of the law granted the control of the law and the control of the and the fraiddows by the qualities of amounts and beauty and and the fraiddows by the qualities of amounts and beauty and with the defect of cool, or dirtie, of polishies, of malalations, for. We believe that success in trade, as with a lation, for. We believe that success in trade, as with a time in Education, untails to the nearest and thatter of the different clauses of purchasers, but that each gradties are the control of the control of the control of the process will assist of the large male.

With respect to the third question, that of price, it is of course a most important question; and it is a most difficult one to answer. The Commissioners had the question due to answer. The Commissioners had the question under their considerable time, and at last wisely determined not to meddle with it. If does not deeped upon arbitrary regulation. Capital, transition, supply and demand, flashion, all more or less affect prices, and pervent them from being the real indicators of the

intrinsic value of an article exposed for sole.

Having ventured to make these general observations, it only remains for us to state the principle upon which the award of Medals has been made, and the grounds npon which the Jury has decided in favour of the suc-

conful competitors. We trust that in what we have said, it will be believed that we have no other object in view than to act in accordance with our duty, and deliver our opinion faithfully, according to the best of our judgment; and in doing so, if we "just hint a fault," we do not "hesitate dislike." We are proud of our manufactures; we enter warmly into the interests of the persons engaged in their production. Perhaps we are over anxious for their success. But we see, and we see it with satisfaction, that the foreigners are making rapid advances; and are bringing their intelligence and their taste into competition with us. We see new and extensive fields, opening every day by the wisdom of Providence, for the application of our energies and our resources; and it becomes our duty, as well as our interest, not to be backward in the struggle. "Up and be doing, and God will prosper," His bounty has prospered us in a most abundant astonishing degree; and, from the tiller of the soil, the manufacturer of her produce, to the fabricator of the most delicate work, it will be by our own fault if we cense to exect. On behalf of that art which is more particularly under our consideration, we claim the exercise of increased energy and science. It is a manufacture for which the primary constituents are easily and cheaply supplied; and it combines, in a remarkable degree, the purposes of ntility, of comfort to all classes, and of decoration. It reflects the splendour of the palace, and the beauty of the toilet. It lends its aid to science, and con-veys the power of vision into infinite space; and, within the last few years, has enabled the astronomer to detect, in the obscurity of their remoteness, planets on which the eye of man had never rested before; and likewise, by its aid, amid the rains of a former creation, countless millions of animalcular may be observed through the microscope in the oditic formations of our globe. It imparts comfort alike to the rich and the poor, by the admission of the bright rays of the sun into their abodes, and the exclusion of the inelemency of the westher. It assists the sight of declining years, and enables the aged man to seek comfort in his hible, and impart its Divine truths to his family. It directs the seamon in his midnight course, warning him of danger, and eheering him by the prospect of security and home.

In drawing up the foregoing Report, information has been most liberally supplied, of the advantage of which the Reporter is fully sensible, and he begs leave to return his warmest thanks to John Wood, Esq., Chairman of the Inland Revenue Board; to M. Boutemps, and to Charles Winston, Esq., for their valuable assistance and advice; to Sir David Brewster, and Mr. Ross, more particularly for that which relates to the question of the structure of glass for optical purposes; and to Mesers. Zuccani, Wood, Pellatt, and others, for the information which they have so readily given. The highly-interesting articles in Larther's Cabinet Cyclopredia, in the Encyclopredia Britannica, and Metropolitana, and in M. Labarté's work on the collection of Dehruge Dumenil, have supplied very valuable information, and will amply repay the trouble of referring to them; and the Reporter cannot conclude without taking leave of the English and Foreign Associates in the Jury, over which he has had the honour to preside; and affording his testimony to the seal and intelligence which they have manifested in the discharge of the duties which they have been invited to undertake; and without expressing his satisfaction in witnessing the cordiality with which Foreigners and Englishmen have acted together; and though differing in habits and opinions, acted together; and though differing in habits and opinions, and urging those opinions with acuteness and with earnestness, have gracefully conceded, where they failed in persuading the unjority; and he begs them to accept his sincere thanks for their able support, and their courtesy, kindness, and indialgence to himself in the discharge of kindness, and indialgence to himself in the discharge of their mutual duties.

AWARD OF THE MEDALS.

the Jury.

The Instructions of the Executive Committee are understood by the Jury to be to this effect:

No question of nationality is to affect the judgment of

No comparison of the respective merits of exhibitors is

to be made. In recommending for the Council Medal, and in awarding the Prize Medal at the disposal of the Juries, the merit of the article exhibited, simply, is to be regarded.

Where an exhibitor is a member of a Jury, he cannot comprete for may Medal. But the Jury think themselves institled in adverting in their Report to the merits of the object which a Juror may have exhibited; and likewise in mentioning favourably those works, which are not of sufficient immerstance to far claim to a Medal.

summerate importance or my claim to a steady.

Excellence in manufacture, being, in other words, a
more difference in dereye of merit between subjects inmore difference in dereye of merit between subjects incouncil Media without a deviation from the principles
haid down by the Commission. Novelty of intention, or
adaptation, or peculiarity in the mode of manufacture, if
deemed of sufficient importance, may entitle to the reward
of a Council Media!

It is important that the exhibitors, as well as the Juny, should keep the principle involved in these Instructions clearly in view; because it cannot but appear at first portance or value of the proper and proper at the proportance or value at Causail Model, while this distinction as recommended for products, which, if not inferior in importance, boundary, or utility, are at least attended with infinitely less expense and rick in the manufacture. But this point, as to relieve the Jury from all doubt upon the

In Class XXIV, these observations gaply particularly as plain-disk, and no crystal, in the floracisation of which mortis of a high code may be obtained. these preliment. All has been excelled, on the reconcionate of the Ayr, to M. Mais, of Chely, user Dreis, for the reason assigned in their Beyer, viz, the Paris, for the reason assigned in their Beyer, viz, the Section of hasse for special paperson, by means of which glass, remarkable for lar printy, brilliary and benay, the control of the printy of the printy of the printy of the special prints of the prints of the prints of the facilitate their facilitate and ensy triffscalists. This facility of prest impresses, printed by the intended for of prest impresses, printed by the intended to the control of the special prints of the prints of the special prints of the prints of the prints of the special prints of the prints of prints of the prints peculiarly injurious to glass of this description. It is true that this glass has not stood the test of time; and that the borax, required for its production, is extremely expensive, and liable to other objections;* but novelty is the principle insisted upon by the Commissioners, and the experiment, as far as it has been tried, has been em nently successful in the production of glass of remarkable brightness and purity; and the object in view being one of great importance, the Jury have viewed with satisfac-tion this first step made by M. Mass at considerable expense and risk to himself; and in the hope that it may lead to important results, they have thought themselves justified in recommending bim to the Council for the award of a Council Medal.

M. Maes has likewise exhibited some very beantiful specimens of coloured, and other ornamental glass.

The name of CHANCE occurs so frequently in the preceding observations, and is so honourably connected with every branch of the manufacture, that we cannot but regret that, according to the regulations laid down by the Commissioners, their firm is precladed from entering into competition for the Medals by the fact of one of the partners having consented to act as a Member of our Jury. But though Mr. R. L. Chance is thus disqualified by his own act, he has entitled himself still more to the consideration of the Jury by the valuable assistance which his practical experience, and intimate knowledge of the details of the subjects committed to our investigation. have enabled him to afford.

When we witness the magnitude and variety of the operations undertaken by this firm, the merit of their works, the liberality, intelligence, and spirit of enterprise, which they have manifested at great cost and risk in experiments, tried for the purpose of introducing into this country branches of manufacture almost exclusively practised by continental enterprise-when we consider the advantage of inducing men, so eminent in their occu-pation as M. Bontemps and M. Tabouret, to settle in this country, and superintend our works—we feel that we should not act with justice by Messrs. Chance, or do our duty by the Commissioners and the public, if we did not call rir attention, in a special manner, to the merita of the firm.

In addition to the improvement effected by Messra Chance, in crown or sheet glass, and the introduction of their patent plate in the market, they have also exhibited specimens of coloured window-glass, of painted windows, of glass shades made by the application of machinery and far exceeding the dimensions of any similar work of this description hitherto attempted, and glass for optical purposes, described in the section to which that substance

is referred, They also exhibit some extremely thin glass, 200 to

300 to the inch, for purposes connected with the use of the microscope, and for experiments relating to the polariaction of light, the want of which had formerly found to be a great disadvantage in researches of this nature. This thin glass was introduced by Messrs. Chance as far back as the year 1840; and the Jury were informed by Mr. Ross, that by its use microscopes were made of very far higher power, than could otherwise

have been produced. M. JULES FRISON, of Dampresmy, near Charleroi,

being a member of the Jury, is likewise disqualified from entering into competition for the Medals. He is sole proprietor of the mannfactory, and carries on an extensive business; the larger part of his produce being made for exportation. He has sent to the Exhibition sheet windowglass of very good quality, well blown, well flattened, with a very good surface, and free from fire-speeks and scratches. He has also contributed some good glass, obscured by mechanical process; likewise some flated glass,

SECTION B.

In the classification of objects exhibited, which has been delivered by order of the Commissioners to the Jarors for their instruction in determining the merits of * The facility with which boracie acid fuses earthy particles is so great, that if not used with much caution, it acts upon the earthen pots, and conveys alumina into the metal, when in a state of fusion

the articles contained in each Class, "painted and other kinds of window glass" are referred, in Section B, to the Jary appointed to consider and report upon Class XXIV., and they proceed, accordingly, to discharge the duty assigned to them by delivering their opinion in the subjoined Report,

But the Medals having been awarded by the Jury of Class XXX, to the exhibitors of the objects referred to in this section of Class XXIV., we shall confine our Report to the statement of what we consider to be the principles of this branch of the manufacture of glass, and the use which the exhibitors appear to us to have made of it,

GLASS PAINTINGS.

Of the class paintings, displayed in the Exhibition, there are some whose subject is a picture, a pattern, no heraldic device, or an intermixture of these three; and some of the pictures, and of the pattern glass paintings appear to have been designed and executed in a particular style of their own. The various works thus present so many different points for consideration as to render it impossible to lay down any one general rule for deciding on their pretensions; but by stating as concisely as we can, the principles by which we have been guided in making the following observations, an opportunity is afforded of ascertaining their correctness or incorrectness; and the exhibitors may be enabled to draw their own conclusions as to the opinion which we entertain of the merits of their works.

It is hardly necessary to observe that glass painting must be judged by a different standard from that which is applied to other kinds of painting. The material employed imposes upon the artist an obedience to certain conditions in the design and execution of the work. His object should be, not to produce the best possible picture, but the best brilliant and transparent picture. Among the excellencies which are equally essential to a good glass painting, and to an oil or fresco painting, may be mentioned, a design which is pleasing in itself, and which is composed with reference to the effect sought to be produced at the distance from which it is intended to be viewed, correct drawing (which includes the course of the shadows as well as mere outlines), and harmony of colone. But such a composition must be chosen, and such a mode of colouring must be adopted, as are calculated, among other things, to display to the best ad-

vantage the brillisney and transparency of the material and to accord best with the mechanical construction of glass painting, which, unless it is of very moderate dimensions, must necessarily consist of several pieces of glass, connected together with lead or other metal, and supported with iron bars. As a general rule, the best, because the most effective,

composition for a glass painting (not being a mere pat-tern), is a single figure, or a group consisting of fore-ground figures, with either a landscape, an architectural, or a plain coloured back-ground; the landscape, if any, being treated as a mere accessory to the group, And the mode of execution which appears to display to the best advantage the hrilliancy and transparency of the material is, where the colonring is chiefly produced by means of glass coloured in the nunnfacture; where the shadows are transporent, but have hard and sharp edges; and, above all, where a large proportion of the lights are left

clear and unencumbered with coanuel paint.

Of the correctness of the view, so far as it relates to the sort of composition, and to the mode of colonring best snited for a glass window, we have the less doubt, since nearly all the exhibitors have acted consistently with it; hat we also find that our opinion of hard-edged shadows and clear lights is opposed to the practice of nearly all the exhibitors, including those most distin-

guished by their works,

* We are speaking of the art in its present state; if ensured painting were to be so far improved as to admit of glass being, by this means, as strongly and vividly coloured as it can be coloured in its manufacture, the objection to colouring glass with coamel colours would fail. But to such an improvement certain physical obstacles appear to be opposed.

To their authority we can only oppose that of the glass painters of the first half of the sixteenth century, when, owing to the similarity of the material, the conditions of glass painting very closely resembled the conditions of modern glass painting; and we would invite a comparison of such works as, for instance, the windows of the chapel of the Miraculous Sacrament, on the north side of the choir of St. Gudule's Cathedral, Brussels, and the two transept windows of that cathedral, with the windows of Gouda Church, Holland, and of Amsterdam Cathedral, both which are of the last half of the sixteenth century, with any of the works now exhibited; and if it appe that the Brussels and Lichfield windows are more liant, more glass-like, and (allowance being made for modern improvements in drawing) as pictorially effective as any of the other works to which we have referred. as any of the other works to which we have referred, then we are justified in considering that the limit to which the obscuration of the glass may be carried was reached at the end of the first half of the sixteenth century, and, consequently, in regarding the works of that period as standards of true glass painting by which nther glass paintings of similar nature may be judged.

The question, however, must ever be matter of opinion, and must ultimately resolve itself into a question of taste, which can only be determined by actually making the comparison suggested, and inspecting the windows themselves. In estimating, then, the merits of a glass pointing, we have to consider, first, to what extent the conditious of

the art have been observed; secondly, its artistic merit as a pieture or painting.

According to these principles, a work in which the emposition and drawing are indifferent, but which dis-plays vivid and powerful colouring, or is brilliant in effect, is preferable, as a glass painting, to one which is dark and dull, but in which the drawing and composition nre good. Of this, we have a striking example in the ante-chapel of New College, Oxford. Sir Joshna Rey-nolds' window, with all its excellencies of drawing and composition, is not to be compared in effect with the rude windows of Wykeham's time that surround it. Still, though n due regard to the conditions of the art is of such preponderating weight in the merits of a glass painting, other artistic qualities, as has been said before are not to be overlooked; consequently, of two glass paintings in which the conditions of the art have been equally of served or equally violated, that is to be preferred which displays the highest merits in composition, drawing, and

other qualities of a good picture.

But besides the two points of view just mentioned, in which a glass painting is to be considered, it is necessary, in order to estimate the quality of a work professing to be executed in imitation of any ancient style, to judge of it with reference to the standard which its anthor has himself chosen. To condemn it, on the one hand, if it falls short of the model which it professes to follow, and fails in the effect which it professes to produce; and, on the other hand, perhaps to make some allowance for pecu-

liarities which wunld be objected to as faults, if they were unt excused by the uccessity of adhering to some characteristic features of the adopted style.

On examining an original specimen of any ancient style of glass painting, we cannot fail to be struck with the general harmony of its features. Not only does a strict consistency exist between the character of the figures and of the ornamental details, but these agree with the nature of the design and mode of execution, which again seem to be adopted and formed with reference to the nature and quality of the material used. The changes effected in process of time in the composition and texture of the glass appear to have involved, in the opinion of the an-cient artists, corresponding changes in the very conditions of glass painting.

In all the glass paintings of earlier date than the last uarter of the fourteenth ceutury-until which period the material commonly in use was not over clear, substantial in appearance, or intense in colour-the artists seem to have relied for effect principally on the richness and depth of the colouring. In these works the means of represent-ation may be said to have been reduced almost to the lowest degree. Even the picture glass paintings are little

else than exceedingly powerful and brilliant mosaics. The figures are hardly distinguishable from each other, unr from the back-ground of the composition, otherwise than hy their ontlines and local colouring. The style of the by their ontlines and local colouring. The style of t painting is simple, bold, and foreible, as if the artists appr hended that softness of finish and nice gradations of light and shade would be useless and ineffective, and deemed those qualities to be alike incompatible with the simplicity of the composition, the positive character of the colouring and the general brilliancy of the work. The drawing is effected by thick black outlines, which always strengthen, and sometimes even supply the place of broader shadows, and these shadows, when compared with those of later times, are weak, and are in great measure lost in the depth

times, are weax, and are in great measure lost in the depth of the local colouring; which circumstance, however, readers their hardness the less perceptible.

The same style of execution is extended to patterns as well as to pictores. The design is traced on the glass with firm and strong outlines; and it is hardly necessary with firm and strong outlines; and it is hardly necessary to remark-for this is observable in every original work. that the harmony in form and character between the figures and the proamental details, proclaims them to be the production of the same hand, and the conception of

the same mind.

In all subsequent glass paintings, until the revival of the more ancient styles, which took place about twentyfive years ago, we may observe that in proportion as the glass became more pellucid, more flitnsy in substance and appearance, and less powerful and intense in colour, a less mosaic and an increased pictorial effect was aimed at. The weakness of the individual colours was in a great measure compensated by their employment in larger masses, by judicious contrasts, and by harmonious ar-rangement. Their depth was increased by means of hroader and more powerful shadowing, and a certain degree of richness was imparted by the more liberal use of disper patterns and other minute embellishments. The drawing became more delicate, nicely-graduated and highly-wought shadows were to a great extent substi-tuted for stiff hlack outlines, and in many instances considerable attention was paid to perspective, and to atmospherie effects. In short, it would seem that the artists considered that the more refined nature of the material demanded as well as favoured a more refined material demanded as well as invoured a more refused pictorial treatment, find sought to compensate for its comparative thinness and weakness by the introduction of heanties of another description. The new system, it is true, was not fully developed until the middle of the sixteenth century; but its commencement may be easily traced as far back as the end of the fourteenth, by which time the principal change in the nature of the material had taken place.

Many persons, and among them some whose opinions are entitled to consideration, differ from the opinion that the material used previous to 1380 has not hitherto been successfully imitated; but on a point of so much importance we are bound to retain our opinion until convinced of its fallacy. That there is a visible difference in the appearance of modern glass and of that belonging to these early periods is admitted; but it is attempted to be ac-counted for by the supposition that it is solely due to the counted ter my the amposition that it is solely due to the effect of nge and exposure to the weather, and that the ancient glass, when first pnt np, must have impeared as weak and filinsy as our own. But as it is evident on breaking a piece of ancient glass, that the effect of minimity is confined to its surface, the above supposition is a contract to the modern of the contract o destroyed by the observation that modern glass whose surfaces have, by artificial means, been reduced as nearly as possible to the same condition as that of the old glass, fails, nevertheless, in its resemblance to the old,

One of the most favourable examples of the eloseness One of the most favourable examples of the eloseness to which institution of the thirteenth century glass can be carried by splashing the glass with enamel hrown and other expedients, is afforded by a window recently put up in Mans Cathedral (the third elevestory window from the west on the south side of the choir). We are unable to west on the south side of the choir). We are unable to say by whom it was painted. But ulthough the design, owing to the breadth of its colouring, is favourable to modern glass, the deception is decidedly incomplete. Equally unsuccessful are the admirable restorations of the earlier thirteenth century windows in some of the apsidal chapels of Bourges Cashedral, executed, we believe, by M. Lasson. The modern glass may here be easily distinguished from the old by its want of crispness and its thinness, although it has been obscured in imitation of the

effect produced by age and long exposure to the atmosphere. We are strongly impressed with the opinion that the difference in effect between such ancient and modern glass does not depend on the state of the surface, but on the composition of the material, and this opinion has been much strengthened by the result of some chemical experiments recently made, by which the very great difference in the composition of modern glass and that of glass of

the thire-subt century is clearly demonstrated.

Secondly. Non-adherence to the style, which has been selected by an artist for imitation in any particular work. For instance, we have sometimes found associated together in the same glass-painting, borders in the style of the fourteenth century, canopies of the fifteenth, and figures of the sixteenth. In others, though the ornamentation is drawn and executed in the style of an early period, the figures are either wholly in the style of a later one, or else accord with the ornamentation only in the drawing or composition; the elaborate softness of their execution having been borrowed from a considerably later period Others, in which the drawing, mode of execution, and composition of an early period are scrupniously observed, both in the figures and ornamental details, are executed in a material, which, owing to its greater pellucidness, is essentially different from that in use at the period chosen for imitation; so that sometimes the different portious of the design itself are incongruous; sometimes the design is of such a character as to be unsuitable to the nature of the material in which it is worked; and we may add that the various attempts which have been made to imitate the richness and depth of the ancient material, hy coating the glass with enamel paint, have produced no other effect than that of depriving it of its brilliancy, and consequently the glass paintings, in which this expedient has been re-sorted to, of one of their chief and distinguishing merits

sorted to, of one of their chief and distinguishing merits.
These observations apply, in our opinion, very generally to the modern style of initiating necion glass paintings. Improvement in the style of drawing, and many other beauties, are to be met with in the objects exhibited.

in Hyde Park, but these beauties are too often neutralized by the defects to which we have ventured to allude. The works are not original compositions, nor are they correct copies of the various styles which they profess to imitate.

BERTINI, of Milan. "Dante and his Thoughts."—In point of size, harmony of design, and beauty of drawing, this window his certainly cuttifed to elaim a first-rate place; now is there any work in the Exhibition, which, taken as a whole, is so superior to it as a glass painting as to prevent its merit as n work of art prepondersting. Its defect is certainly the want of general hrilliancy. Except in the Queen's glory, in the letters of the inscrip-tion over Dante's head, in the shields below, and the wreath surrounding his name (all which are true specimens of glass painting), and in the border of the windows, there are no sharp clear lights; and although pot-metal or flashed glass is used in places, as in Dante's robe, in the steps of the seat, in the sky to Domenico and Francisco, and in the role of the figure in No. 4, it has been reduced to the same opacity as that of the enamel colouring employed in other parts of the window. subjects taken from the infernal regions, Nos. 1, 2, 3, 4, are scarcely fitted for a glass painting, which is not suited for dark effects. The whole work is executed with so much softness, and is so highly finished, that the metallie fastenings have a harsh effect and form black lines, which do not harmonize with the delicacy of the painting; and though in general they are concealed with wonderful though in general they are concealed with wonderful skill, yet they do appear in places, and rivet the attention the more the window is looked at. It may seem pre-sumptuous thus to criticise one of the best works of the day; but the admiration which we feel for it has led as to compare it more rigidily with the windows at Hrassels, and to arrive at the conclusion that it would suffer by comparison in point of general effect, though it would doubtless be superior to them in artistic refinement and drawing. Compared, however, with the more modern works it appears to advantage; for the quantity of white light introduced in the upper part of the design, in the Madonna, and in the trucery above, the angels, the erockets, and above all, in the organiental bands or fillets which serve at once to connect together and to frame the dif-ferent subjects, imparts to the window a silvery or glasslike effect, which none of the others possess, and which completely rescues the work from the imputation of being like n fresco painting. The execution of the cruckets and of the folinged ornaments round the shield is quite per-fect; but perhaps the greatest display of skill is the manner in which Danet's head is made to stand free from the chair's back. The representation of one of the belies' silk dresses and of the lining of Dante's clock is a wonderful achievement in painted glass, and perhaps could not be accomplished in a work in which elear lights were considered indispensable.

In conclusion, we have only further to observe, that the defects which we have ventured to notice are those which persuit very generally in the works of the present day; but the beauties exhibited by M. Bertini in this production greatly preponderste, and are his own. Capronners, J. B., Brussels.—The conditions of the

ant of plass painting appears to have keeps compiled with, on the whole, it this work more thilly than in any other of equal or superior size in the Exhibition; for nor only for distortions of critical and increase and decision of the control of

The above is an extract from a very able Report upon the art of glass painting, and the objects exhibited, which Mr. Churles Winston, of the Temple, has had the kindness to supply.

F. H. Balescea, M.P., 5 Hyde Park Place. (Juror in Class XXIV.) Thomas Hermangron Hener, F.R.S., 18 Lincoln's Inn Fields; Analytical Chemist.

In framing our Report on Class XXV, we are desirous of explaining, in the first place, the view we take of the duty assigned to us, as determined by the rules of the Royal Commissioners, and by the nature of the Class

In the first place, the appointment of Juries implies, of course, that they are to judge of the comparative merits of the articles submitted to their inspection. In the second place, the fact of Medals being intrusted to their award implies, farther, that it is their duty to specify those articles which, in respect of high degrees of merit, they deem most remarkable. And lastly, the injunction tney seem most remarkable. And lastly, the injunction to accompany their judgment with a Report, implies an expectation that the Jaries, besides explaining to a certain extent the grounds on which that judgment has been come to in respect of Medals, should also indicate their opinion generally, on different kinds or minor degrees of merit.

These duties, however, become somewhat complicated by a special instruction from the Royal Commissioners that the Juries are to avoid giving encouragement to the distinctions of a merely individual character, and by an explanation that the award of Medals of different orders should not imply corresponding differences of degree in merit in the same class of subjects." We have been much impressed both with the importance of complying with this instruction of the Commissioners, and with the difficulty of reconciling it completely with the necessary exercise of our functions. We have felt that in case of the Conneil Medal being awarded to one or more exhibitors of ceramic manufacture, "individual distinctions" would be necessarily involved between those exhibitors. and others to whom only the Prize Medal may be given; and again, whether the Council Medal is given or not to any, the same distinctions may be felt between those exhibitors who do get the Prize Medal and those who receive non

The withdrawal of the Council Medal from the direct award of the Juries, and the limitation of their duty to recommendations merely for that award, has divided the responsibility, but has not removed the difficulty arising out of these considerations; inasmnch as recommenda tions, whether acceded to or not, involve the same distinctions as an actual award.

It has therefore been a matter of anxious consideration among the Juries to come to something like a common understanding as to the grounds on which such recom-mendations should be made; and the Group to which we belong, accordingly laid down the following general defi-nitium of the kinds of merit which ought alone to be so.

distinguished:--" Important inventions and discoveries or originality combined with excellence of design; novel application of known discoveries; great utility combined with economy and beauty; excellence of workmanship ned quality

Some of these definitions are obviously not easily applied to the kind of merit usually claimed for articles of ceramic manufacture; whilst others would require to be taken in an adapted sense. "Novelty of invention," unless displayed in entirely new compositions of the elementary earths, or in entirely new modes of dealing with them, will, in such manufacture, be generally re-ducible to improved methods of execution. Or if a higher sense be attached to "invention," as applied to form and high artistic meet, it will then fall under the other defi-

Understanding "invention" in the former and stricter sense, there is only one article in our Class in respect to which any important claim could be well advanced: we refer to that particular pasts or body which has been variously called Parian, Carrara, or Statuary Porcelain, and which must undoubtedly be viewed as marking an important advance in the ceramic manufacture of this important savance in the ceramic manufacture of this country. The facility and comparative cheapness with which the highest works of soulpture can be reproduced in this material—its durability and its beauty, have comhined to give an important stimulus to the trade, and if well employed may much contribute to improve the public taste. It has already led to the great multiplication of copies of both autique and modern groups and statues, as

well as to new designs of a similar kind. But whilst fully acknowledging the importance to the ceramic art of this material, we do not feel called upon to found upon it any recommendation for a Council Medal. In the first place, the amount of novelty in the material is not easily defined, it being a modification of that which has long been known, and applied to the same department of art, under the name of Biscuit. However important this modification may be, it is hardly entitled to rank as an entirely new invention, especially as the improved result is attainable by several varieties of com-This seems sufficiently established, not only by nosition the fact that different manufacturers produce substantially the same material without identity of process, but by the further fact, that one of those who prefer a claim to the

origination of parian expressly states that in his hands it has already undergone one important change. In addition to this consideration, the Jury find that

disputed claim of priority between very eminent firms, who severally advance that claim with equal confidence. We have not felt it to be our duty to come to any such decision; especially as it would appear from the statement of each party that, whichever may have actually been first in publicly producing articles in this material, both were contemporaneously working with success to-wards the same result. We may add that the introduc-tion of parian took place several years ago,

There is one other claim to novelty of invention in onr class which, perhaps, goes nearer to failfil the necessary conditions: we allude to the process of M. Bapterosses for the manufacture of buttons by pressure applied to a dry body in the state of powder; but here also we consider the merit to be to a great extent divided. The original idea of this process is due to Mr. R. Prosser: and, under a patent obtained by him it was carried on for some time by Messrs. Minton. improvements, however, effected upon the process by J. F. Bapteresses, have been so great and so important, that the invention has, in a great measure, become his own, and has emabled him to beat the English manufacturers entirely out of the market. The principle, however, is identical. Under these eirenmstances, we have been unable to recommend M. Bapterosses to an award of the Council Medal on the ground of novelty of invention; although his merit is undoubtedly so high that we deem him well entitled, not merely to the award of the Prize Medal, but to very Special and Hunourable Meution, on account of the inventive talent displayed in his process.

As the Jury do not, therefore, think that any sufficient ground for the award of the Council Medal has been

presented, as regards priority of invention, it has only remained to consider whether they could recommend that award on the ground of "beauty and originality of Although we do not hold ourselves bound to any yes

close or literal interpretation of this definition, we should still be departing from the whole intention with which the Council Medal was withdrawn from the direct nward of the Juries, if we were to recommend it for any article or set of articles on account simply of superior execution in the same class of subject; and that, in as far as possible, we ought to limit ourselves in such recommendations to merit capable of being clearly separated from others in kind, and not merely in degree. It is only by adhering to this distinction that we can comply with the important instruction to avoid giving encouragement to "individual competition;" and although it is a line which cannot always be laid down with perfect precision. it is still capable of being followed with substantial fairness. For example, if two manufacturers exhibit each vases, plates, &c., with flower or laodscape painting, and if the articles of the one were of great superiority is execution to the other, this saperiority, however great, ought not to be expressed by a recommendation to the Council Medal, because these two exhibitors are evi-dently competitors in the same kind of merit; whereas, if one manufacturer shows articles of the above description, whilst another shows articles of new and beautiful form, and of high artistic merit in the grouping and design of figures, such two exhibitors are evidently sor competitors in the same kind of merit, and the latter might be recommended for the award of the Council Medal without any "individual distinctions in the same class of subject" being drawn between them. The same distinction may be truced even in kinds of merit, which are both in a certain sense imitative. The successful introducer, into this country, of important processes of manufacture formerly confined to other lands, possesses a merit very different in kind from imitations more or less successful of the paintings and ornaments of old Sevres

or old Dresden. Having thus explained the principles on which we have thought it our duty to consider recommendations for the Council Medal, we have only shortly to point out the consequences which result on the value to be assigned to the Prize Medal. Being the only one which we have to award fur the whole articles of our Class .except the few which answer the conditions demanded

for the Council Medul,- it follows that very wide differences in degrees of merit must indiscriminately receive the same acknowledgment-so far as the Medal merely is concerned. This circumstance will be strongly felt by many of the exhibitors who receive the Medal, and will diminish the value set on our awards. We have only to explain that it has tended equally to diminish the satisfaction with which we have made them; but that no evil or injury can arise from the result, provided the cause of it is publicly known and understood. The task of petitors in the same class of article was not only not given to us, but was ndvisedly withheld; and we have, therefore, only to explain emphatically that we by no means regarded as on the same level, or even near the same level, all those exhibitors to whom, nevertheless, we have been obliged to give the same award. In our Report we have held ourselves at liberty to depart, to a certain extent, from the rale which applies to Medals, and to point out the broader individual distinctions observable in our Class.

Oue other circumstance has presented itself respecting onr awards, which we feel it necessary to meution. Our Class contains the produce of royal, national, or imperial manufactories; and it has been argued that these ought not to be brought into competition with the produce of not to be brought into competition with the produce of private enterprise. In a certain sease we admit this reason, in a certain sease we will be a case of the ca to overcome. The element of price, being an element of the most important character, does not euter into the the most important canneter, soes not enter into the view of the one, whilst, for the most part, it strictly limits the efforts of the other. The merit, therefore, as regards commercial value of their respective works, can-not be easily compared, and is certainly not measured by a comparison simply of their beauty. We are relieved, a comparison simply of their beauty. We are relieved, however, from the difficulty which might arise out of these considerations by understanding that we are to judge of the articles in our Class as they appear before us, without reference to extraneous considerations respecting origin. We think it our duty, however, in the Ideport to point out the important distinction above referred to, and to explain distinctly thut, in admitting, as we unanimously do, the very high character of the Sevres Exhibition, and in recommending it to an award of the Council Medal, we do not hold that in point of merit it can be justly compared with any other series of articles in our Class, except those which are similarly reumstanced.

Refore proceeding to notice particulars, we may observe that the ceramic art of the world is represented by a series of articles, which, though not calculated to illustrate its past history and progress, is at least sufficient to give a very adequate idea of its present condition. The imperial, royal, or untional manufactories of Russia, Austria, Prussia, Saxony, Bavaria, Denmark, and France, have all sent specimeos of their production. Private enterprise in the same art is honourably represented from France, from many of the States of the Zollverein, and from Austria. A few exhibitors appear from Portugal, One article is shown from America. Turkey is also exhibited in a limited number of articles. The East India Company show specimens of the graceful forms of Judian pottery; whilst the well-known productions of China are among the articles collected from that country. But, undoubtedly, the collection which most largely represents the commercial importance of the ceramic art as a branch of manufacture, and the advances it is capable of making under no other infinence than that of private enterprise and public taste, is that which is exhibited on the British side, and mainly contributed

by the Staffordshire potteries.

Minros, H., and Co., Stoke-on-Treat, Staffordshire (1, pp. 709-711), stand foremost among the British exhibitors for the number, variety, and beauty of their

"We have found it necessary to view this collection in two divisions: first, in respect of a group, of articles which we have considered distinguishable is kind, and not merely in degree of merit, from all others in the class; and, secondly, another group which, though of high excellence and beauty, must be tooked upon as high excellence and beauty, must be tooked upon as by several other manufacturers. The first of these is the great deserts ervice, which has attracted universal

notice.

or "Jay" has principle for history protects the two different bodies of port/chin and potate, an detection of which the bodies of port/chin and potate, an detection multip of effects, and, in a certain extent, from next or the principle of the protection of the potation of the protection could be nutation, except on a potent nine which would be for from receiving universal assent reference to the position of the figures, as being too pretty and evidently for erament takes, and having too pretty and evidently for erament takes, and having too two which they are appled. To this it may be produced to the protection of the figures, as being too two-based or dispure, for oursand taking, it is clearly now which they are appled. To this it may be produced, that such as well and become relationship, it is clearly now which requires to be very strictly governed by pool took, just the subsidial become relationship, and the protection of the pr

The Jary were, however, ananimously of opinion that the dessert service of Mears. Mirrow, being one of original design, presents a very high degree of beauty and harmony of effect; and that the design and modelling of the figures in many of the pieces are full of grace and spirit, evincing a remarkable degree of artistic merit.

The Jury mint specially mention, as belonging to the first group of articles, the grade-upots and vases exhibited by Mesers. Minnes, modelled in initiation of the old with which the effect of that ware is attained, but for novelty and beanty of design. A large vase, intended or similar purpose, designed by Baron Mascenters, both for beauty of style and great size. Thirdly, the attention of the Jury was directed to the

mounterier of hard povedan for cleanies) purpose, lately established by Meser, Murrow, I is well known that for such articles the liberatory has bithered been muniforteries; there existles and opposite have been subjected by Mr. Benry, at the instance of the Jury, to Dreden, and have been found to stand these tests with prefer inscess; and besides being fully equal to the being considerably chepur. The Jury have considered the meseral citabilishment of this manufacture in a security point of view of hypothesis and the second and the second control of the manufacture in a security point of view of hypothesis and the second of the manufacture and interest in

ware.
The attention of the Jury has been much attracted by two designs, one of a bust, the other of a wase, executed by Janes Maxes (34, p. 752), a young pupil of the School of Design, Hanley, Staffordshire, which possess

remarkable sucrit, and deserve very Special and Honourable Meution.

In the French Department of this Class the Jury need bardly state, that they have unanimously assigned the first place to the Sevans Manifactor, and have recom-mended the Council Medal to be awarded to its produc-They must, however, again explain, that the light in which these ought to be regarded is wholly different from that in which the productions of commercial industry and enterprise are viewed. Their position is analogous to that of articles produced in a school of design; and in the French expositions they have never been sllowed to come into competition with the ordinary products of private enterprise. There is no reference to cheapness of production. The manufactory is maintained by a large production. namual grant from the public fuods, and the sale of its products, though the prices are very high, is so far from being successful, in a commercial point of view, that the result is a large annual loss. The articles are, for the most part, purely decorative. But considered as a school of design, which is not to follow but to guide the public taste, the importance of the Sevres manufactory can hardly be too highly estimated. Its influence has extended over the whole of Europe, and a large proportion of the most beantiful forms and styles of decoration, which are exhibited in the English and other departments of this Class, are derived either by direct initiation, or by slight modification, from the old productions of the Sevres school. The Jury are not prepared to say that the articles exhibited from Sèvres are equal, either as regards variety or excellence, to those which were sent forth from the same establishment at a former period, and on which its tra-ditionary fame is principally founded: but without any attempt at the mere imitation of its own old forms, it still produces wares of admirable texture and workmanship, and equally remarkable for great refinement and purity of taste, both as regards form and decoration. It is to be observed, bowever, that in respect to texture, extreme lightness and fineness are incompatible with the strength requisite for domestic use, however beautiful for merely ornamental Chinn. The Jury may specify in the Sovres department several large vases,—one or two of unusually largo size,—which are all remarkable for beauty of form, and some of them for flower-painting, of admirable freshness and force. A large tazza, of fine blue, mounted in or-mole, is extremely handsome. As a work of pure (16) a Celadon green wase, with white figures in relief unipulated in a novel and peculiar manner by the pencil. The handles are also of porcelain, the whole deriving no adventitions attraction from or-molu or gilding. The Jury also observed a beautiful adaptation of a cinquecento form to a porcelain tazza, in white and gold; also a large plate or slab of porcelain for picture-painting, re-markable for great size, combined with truth of surface, Two perforated porcelain lanterns are worthy of Special Mention for very elaborate and accurate execution. articles are exhibited with painting of figures (in Pompeian atyle), executed on an ungiazed body, which produces a novel and agreeable effect. There are also two vases and covers, and a large tazza finely painted with figures in a subdued shade of blue, which are very beautiful.

MM. JOUHANNEAUD and Dunois, Limoges (1630. p. 1255), are exhibitors to whom the Jury have had great pleasure in awarding a Prize Medal. Articles in pore-lain, of great size, good design, accurate excention, are among their productions. In particular, the Jury would refer to a stork vase, in which the hirds are modelled with great boldness and effect, as also the green foliage. white ground is of excellent colour and glaze, and the whole result most agreeable. Some large white perforated bottles and a white and Celadon green was, with leaves of blen-de-roi, &c., are objects well deserving special notice. Altogether much taste and spirit distinguish these exhibitors.

LE BARON A. DE TRENDLAY, Rubelles, near Melun (393, p. 1197), exhibits a series of articles equally remarkable for ebcapness, for novel and agreeable effect, and for the ingenuity of the process by which that effect is attained. It is called "caudi ombrant," and consists in

flooding coloured but transparent glazes over designa stamped in the body of the ware. A plane surface is thus produced, in which the cavities of the stamped design appear as shadows of various depths, the parts in highest relief coming nearest the surface of the glaze, and thus having the effect of the lights of the picture. taste is evinced in the selection of designs to which the process bas been applied; and perhaps there is no other in the ceramic art by which, at so chenp a rate, designs of bigh artistic merit can be reproduced in the most harmobigh aristic merit can be reproduced in the most harmo-nious tinting, for dessert or table services, and for other useful domestic purposes. The Jury have awarded to Baron Du Trembhya Pritze Medal. Gille, J. M., Porcelain Mannfacturer, Paris (848, p. 1220), exhibits a variety of articles of fancy porcelain, which show taste and skill in the misnagement of the

material. Some statuettes, birds, &c., are executed with great delicacy and sharpness. The Jury have awarded a

Prize Medal to this exhibitor.

M. DE BETTIONIES, St. Amand les Eaux, near Valen-M. DE HETTIONIES, SI. Amand SE LEARS, BERY VAIG-cience (1008, p. 1250).—This manufactory is remarkable for keeping up the old "like tender," which was so eighteenth century; and this and the neglulouring manu-factory of Tournay, in Belgium, are now the only two in Europe which maintain this particular kind of body. Much improvement has lately been effected by M. de lettipuies in the coloning and decoration of this ware; Bettignies in the cooloring had decoration of this ware; and specimens are exhibited, especially some vases of integories blue, which will be deserve, in the opinion of the M. Massaan, Paris (1342, p. 1240), is an exhibitor whose potteric grise is excellent in its forms. There is an enamelled vase which is deserving of pariental notice, and the Jury have awarded a Prize Medal.

Baytrasonaya, J. P., Rue de la Muette, Paris (409,

p. 1197), exhibits buttons made by a process equally effective and ingenious, described in the earlier part of this Report, by which an importance has been given to this branch of ceramic manufacture, which could not have otherwise attached to it. The Jury have had no hesitation in awarding a Prize Medal to M. Bapterosses, and Special Commendation,

The Jury have also awarded Prize Medals to the following Exhibitors: BASTO, PINTO, and Co. (Portugal, 1047 and 1108, p. 1317).

Copenhagen, THE ROYAL PORCELAIN MANUFACTORY at (33, p. 135) MADRAS POTTERY, THE (p. 921)

St. Petersburg, THE IMPERIAL CHINA MANUFACTORY at (318, p. 1376). STRAHL, ОРТО (Prussia, 206, р. 1059). VILLEROY and Носи (Prussia, 361, р. 1071).

ZIEGLER-PELLIS, (Switzerland 260, p. 1283), terra-cotta,

deserves Honourable Mention. Besides these Exhibitors, the following names in the French Department have been thought deserving of Special French Jepartment have oven thought deserving of Special Mention:—H. I. Nart (659, p. 1209); ALLUAUS, sen. (1051, p. 1229); E. Honorić (877, p. 1221); C. Avisseau (1543, p. 1250); J. Pitt (1629, p. 1255); and Gorsas

and Peries (1253, p. 1237).

Austria. — The Imperial Porcelain Manufactory of VIENNA (615, p. 1038), has exhibited a series of articles for table-services, of different kinds, flower-baskets, a table painted with shells, corals, &c., &c., which have certain merits, and the Jury have agreed to award a Prize

FISCHER, Moritz, Hungary (618, p. 1038), exhibits po celain articles of table-ware, embossed with white and gold, and with other patterns. The texture and colour of the white are good, and the Jury have awarded a Prize

The Jury also considered, in the Austrian Department, the Mesars. Haidinger Bhothess, Ellbagen, Bobenia (620, p. 1039) as deserving Honourable Mention; as also

FISCHER, Bohemia (617, p. 1038).
In the Department of the Zollverein, the Royal, Porce-LAIN MANUFACTORY AT BERLIN (Pressis, 213, p. 1060), exhibits a variety of articles, of which the chief merit consists in the landscape-painting, which is extremely consists in the landscape-painting, wraten is extrusery well excented, and is employed in the decoration of vases, plates, &c. The same good execution is carried out in picture-paintings, ebiedly copies of pictures of the Flemish sehool, on similar articles of poreclain. Much of the Berlin china is so covered with gold and painting that the body of the ware is almost cantirely concealed. There are also exhibited from Berlin some statuettes in porcelain, and candelabra of the same material, with leaves and figures on a pale greenish-grey ground, which are of good execution and design. The Jury have awarded a Prize Medal.

THE ROYAL SAXON CHINA MANUFACTORY, Meisser (Sexony, 10, p. 1105), exhibits the hard porcelain for ehemical purposes, for which it has been long eelebrated; also a considerable variety of ornamental china, as well as of dinner and coffee services, &c., &c. Some of these with ennmelled paintings are well executed. A camellia plant in full flower, entirely executed in porcelain, is a very re- p. 1060). markable example of a kind of work which has long

maintained its ground in this manufactory, aided by the natural ductility of the clays which are employed. The flowers of this plant are executed in white of the greatest purity; and the leaves are all finely glazed. The Jury have awarded a Prize Medal.

THE ROYAL BAVARIAN PORCELAIN MANUFACTORY (Bavaria, 64, p. 1101), Nymphenburg, near Munieh, exhibits articles in biscuit, and a variety in hard decorated porcelain, which manifest decided ndvance in taste both as to form and decoration. The picture-painting on some of these is extremely well executed. On the whole the Jury observe in this exhibition much spirit and originality, and have awarded it a Prize Medal.

Honourable Mention is accorded to the following:-

Annoldi, C. E. and F. (Prussia, 778, p. 1693). Constantinople, Porcelain Factors at (p. 1397). Mattschass, J. G. H. (Widow), and Son (Prussia, 217,

TIELSCH, CARL, and Co. (Prussia, 219, p. 1060).

October 1851.

Tax objects comprised in this Class are of a kind intimately associated with the comfort and adornment of our dwellings; of great importance from the vast amount of skilled labour employed in their production; and of high interest, as displaying the state of industrial art in various countries.

A popular taste must be greatly influenced by those things which are ever before the eye as brusehold com-panious, and in the manufacture of these it is therefore most essential to attend to the principles of tasteful design, for by those principles an article obtains its power of attraction.

Farniture

It is important, both for the strength and good effect of furniture, that the principles of sound construction be well carried out, that the construction be evident, and that if carving or other ornament be introduced, it should be by decorating that construction itself, not by overlaying it and disguising it.

It is not necessary that an object be covered with ornament, or be extravagant in form, to obtain the element of beauty; articles of furniture are too often crowded of beauty; articles of furniture are too often crowded with unnecessary embellishment, which, besides adding to their cost, interfers with their use, purpose, and con-reninese; the perfection of art manofacture consists in combining, with the greatest possible effect, the meful with the pleasing, and the execution of this can generally be most successfully carried out by adopting the simplest

The Jury, though fully sensible of the great beauty of many of the ornamental works in furniture collected at many of the ornamental works in furniture collected at the Exhibition, yet regret that there have not been more specimens of ordinary furniture for general use; works whose merits consist in correct proportion, simple but well considered design, beauty of material, and perfect worksmabilp. Few have the means of purchasing such beautiful works as the sideboard of M, Fondulosis, or the cabinets of M. Ringuet-Leprince, which come almost under the head of fine art rather than of manufacture; and it is much to be desired that attention be directed towards improving the taste of those more ordinary objects that come into daily use by the many.

Cabinet furniture first became an article of general Cabinet furniture first occame an arrived vi geogram luxury about the beginning of the 16th century. At this period inlaid, as well as richly-carved furniture, was manufactured in Italy, and exported to various parts of Europe. Among the works now exhibited by Italy, some are distinguished by great excellence, particularly in the

carved examples, From Therang.—M. A. BARBETTI, of Florence, Sienna, (91, p. 1298), exhibits, with other things, 2 casket of great merit, most elaborately carved, introducing bas-reliefs of figures, ornaments, chimeras, &c.

A large cheval screen frame, in waluut wood, by Lutor MARCHETTI, of Sienna (26, p. 1228), is very beautifully wrought with delicate ornament of good taste. An oval medaliion frame, by PIETEO GIUSTI (123, p. 1500), is also

a fine specimen of carving a nne specimen of carving.

From Sardinia.—M. B. Capello, of Turin (64, p. 1304),
exhibits a very elegant inlaid table, a curule chair, and a pedestal-all ornamented in very pure taste in the Etruscan style, and of good execution

In France ornamental cabinet-work had acquired considerable reputation in the time of Louis XIV. Its manufacturers have since then continued to produce works of great beauty, and have brought the art of marqueterie inlay to a high state of perfection: this work consists in inlaying woods of a great variety of tints in the form of flowers, ornaments, &c., and was greatly advanced in the last century by Reisner, who produced very beautiful

In buhl-work, siso, wherein metals are inlaid upon grounds of turtoisesbell or ebouy, or rice versi, the French have greatly excelled. This kind of ornamental inlay takes its name from M, de Boule, a celebrated French cabinet-maker in the time of Louis XIV.

In Germany there has loog been established cabinetwork of a high class, more especially for those exquisite ebony cabinets, inlaid with precious stones, and various woods and metals, surmounted with carved figures, and elaborately fitted with innumerable drawers, and with perspective recesses—presents fit for kings and princes: of these an excellent example is presented in the clony cabinet of M. Grioca, of Vienus (631, p. 1039)—a most beautiful work, exquisitely finished.

Cabinet-work of a more useful description has been carried to a bigh stote of perfection io Great Britain, whose manufacturers have studied to produce objects in which the prominent excellence is substantial quality and

fioished workmanship.

It was in England that mahogany, now so generally used, was first employed for eabinet furniture, about Dr. Gibbons, an emineut physician, baving bad some planks of this wood given to bim by his brother, a West India captain, who had brought them in his vessel as ballast, wished to use them for a bouse be was hailding in King Street, Covent Garden, but the carpenters com plained that the wood was too hard; it was therefare laid aside as useless. Soon after, Airs, Gibbons wanted a candle-box, and the Doctor called in his cabinet-maker, Mr. Wollaston, to make bim one of this wood, then lying in He also declared that it was too hard: Doctor said he must get stronger tools; the caudle-box was completed and approved, insomuch that the Doctor then insisted on having a buresu made of the same wood, which was accordingly done; and the fine colour, polish, &c., were so pleasing, that be invited bis friends to come and see it. Among them was the Duchess of Buckingham, Her Grace begged some of the same wood from Dr. Gibbons, and employed Wollaston to make a bureau for her also; on which the fama of mahogany and Mr. Wollaston was much raised. The wood became the fashian, was

was much raised. The wood became the fashian, was much admired, and from that time has continued to be used for furoiture more than any other. It will not be possible to give a description of the various details of the manufacture of cabinet-work, but an account of some of the more ornamental processes and

results connected with it may be desirable.

Of these the marqueterie inlay is one of the most beautiful and interesting. In this work the design, baving been first drawn on paper and properly coloured, is pricked with a fine needle, so that the outline of the ornament or other objects can be pounced on the various coloured woods proposed to be employed; these outlines being carefully marked in, are cut with a fine watchspring saw, worked in a lathe; in most cases the wood forming the ground is cut with that forming the ornament, so that a piece cut out of white wood corresponds exactly in shape and size with the opening left in black wood, in which it therefore fits and forms the required

pastern. Tursia-work, or the art of inlaying woods, had been practised from a very early date in Italy, and extensively employed in the decoration of wall panelling; and extensively employed in the decoration of wall panelling; and re-mains of this kind of work, revived by Fra Giovanni di Verona, in the 15th century, still exist in some of the Italian churches.

The earlier specimens of this work were executed in woods of different shades, but natural bues; afterwards, when flowers, hirds, and coloured ornaments were intro duced, various stained woods ware employed: these, in most cases, have the disadvantage of fading, but in the admirable specimens of marqueteric inlay exhibited by M. CREMER, of Paris, (1573, p. 1252), the woods are stained by the process of M. Boucherie, which is stated to give them a permanent due to a considerable deput. Notwithstanding, however, the beantiful effect of this work, it is desirable to adopt, as far as possible, the employment of woods of natural hues, as being more harmonious and more consistent with the nature of the

work. in those ornaments which are shaded, the effect is given by immersiog the pieces in hot sand. The various parts, being cut out of the required tints in the proper form, are then placed according to the design, and fixed on paper; afterwards they are applied, like veneer, to the piece of furniture; being monnted, they are cleaned off and slightly polished, and the floer lines are then engraved. The manufacture of habl inlay is by exactly the same process, only that metals, tortoisesbell, and chony are

here the moterials employed; the nature of the design is somewhat different, depending more upon simple outline forms. There are many beautiful specimens of this kind of work in the Exhibition, more particularly the cabinets

where the figures and ornaments are designed and finished with infinite talent and skill,

There is another kind of inlay applied to furoiture, which may be called mosaic inlay. The beantiful boxes made in India give some good specimens of this work in ivory and metal, equalled, however, by the inlaid furniture and and meth, equaled, however, by the mind furniture and boxes of M. Marcelin, of Paris (606, p. 1207): the ex-traordinary table of Schor Pranz, of Spain (2714, p. 1346), gives a fine example of this style of work, executed entirely io minute portions of wood; the same principle is carried out in a table by NYE, of Toubridge

Wells (54, p. 733), Where the patterns assume geometric forms, this kind of work is executed by laying together slips of wood or metal, &c., in the particular forms required; these united slips are then cut transversely, and affixed to the grounds, as in marqueterie.

Immediately connected with inlaid cabinet-work is the manufacture of parqueterie, for floors; in this work the same principle is carried out as in marqueteric, only on a bolder scale; woods of different colours are cut to pattero. and inlaid one in the other, or so arranged as to produce very beautiful effects for floors. The specimens exhibited of MM. Couvert and Lucas (404, p. 1163), and M. de Keyn, of Belgium (406, p. 1063), of MM. Leistlen DE KEYN, of Degrum (400, p. 1003), of Nov. Livisian and Sox, of Vieuna (633, pp. 1039-40), and of Mr. Miz-len, of Russin (199, p. 1376), show the perfection to which this art bas been brought.

which this art has been brought.

A very beautiful novelty at this Exhibition was the introduction of porcelain inslaid in furniture like marquetrie, by Messrs. Rivarr and Axborizz (1439, p. 1245); in these examples, not only were panels of porcelain inserted, but the painted flowers were cut to form, and injuid like the oronamental woods. In the eahinet of Mr. Downtooth, of London (404, p. 760), porcelain of a very high class of art is mounted in the panels and pilasters; and M. Gambs, of St. Petersburg (297, p. 1376), contributes a cabinet in tulip-wood, mounted in or-molu, containing beautiful panels in porcelain. M. A. E. RINGUET-LEPRINCE (1437, p. 1245) has introduced enryings of ivory, mounted with ormolu, on one of his cabinets, with excellent effect; and in his most beautiful ebouy cabinet for medals, relieved with exquisite carvings, fine stones are inlaid so as to form part of its decoration. Many of the pieces of furniture owe much of their attraction to the metal ornaments with which they are mounted; but the ebony cabinet of M. Barsedienne (1709, p. 1258) combines, in the very of a high class of art, so arranged as to form one nuited

whole. Of carved furniture there are many magnificent examples in the Exhibition. In the struggle to produce objects that might be specimens of the talents of the parties employed upon them, utility and purpose have in some degree been forgotten, and works brought forward that are objects of art rather than manufacture; still it is one of the advantages of this result that it tends to improve the art workman; it gives opportunity for the display of his skill; it causes a school of art to grow up nod extend itself; and if it err by excess, it at any rate creates the buffet of M. Focadinois, of Paris (1231, p. 1238), is of the highest merit: whether for its composition, the execution, it is a noble work. The specimens by M. Lienand, of Paris (1826, p. 1239), though not large, are of great excellence, showing to what perfection and beauty the art of sculpture in wood can be brought, A large frame in pear-tree wood, very beautifully curved by M. Lecheson (573, p. 1205), affords another fine spe-cimen of this branch of art.

The grand callection of furniture by MM. LEISTLER and Sox, of Victors (633, pp. 1039, 1040), exhibited in four rooms, displays considerable fassey and excellent workmanship, though the oranment is far too redundant for ordinary purposes.

The grand bookense of Messrs, HotLAND, of London of work in the Exhibition, more particularly the cabinets (161, p. 745), is another example of carved furniture of a of M. Fortuga, of Wurtzhurg, Bavaria (69, p. 1101), high class, and the sideboard and bookease of Messrs,

JACKSON and GRAHAM (261, p. 755), the buffet of Messes, Cooke, of Warwick (110, p. 827), the bed and toilet furniture of Messrs. Thollow (162, p. 745), the carved glass frame and other furniture of Messrs, SNELL (17tt, p. 746), the beautiful eradle and other objects by Mr. Rougus (353, Class XXX., p. 842), a writingtable in walant wood, with other specimens, by Messes, Gillows (186, p. 748), and many works by other manufacturers of Great Britain, show that industrial art is well

represented in this country There is another branch of cabinet-work which merits particular notice, that in which mechanical action is inroduced; the specimens exhibited by MM. DAUBET and DAUMARET, of Lyons (1579, p. 1252), are most ingenious and curious; in their secretaire, which is full of con-trivances, one key unlocks all the drawers. These run in the most easy and perfect manner, if touched in the slightest degree; and the closing of one particular drawer shuts and fasters all the others. M. KHEGES, of shuts and fastens all the others. Paris (1283), also exhibits some farmiture of excellent mechanical action, such as card-tables, toilets, &c.; and M. Von Hagen, of Erfurt (770, p. 1093), has a cabinet of fine workmanship, in which the secret mechanism is

skilfully carried out In the Austrian Collection are some curious chairs and furniture by M. Thoner, of Victor (641, p. 1040), in which the wood, inlaid with metal lines, is bent to the required forms without the usual framing.

Many excellent billiard-tables are exhibited: in one, by M. Bornamper, of Paris, (1106, p. 1230), the curving is of very beautiful design; another, by M. Kelle, of Vicunn (632, p. 1039), is bandsomely mounted in buhl inlay, and the inlaid ones of this manufacturer are very beautiful specimens. The billiard-tables of Messrs. THURSTON (17, p. 731), and of Messrs, Burnoughs and WATTS, of London (4, p. 730), are of simpler construction, but solid, and of excellent workmanship.

Decorations.

The specimens exhibited under this head are decorations for walls and ceilings, imitations of woods and nearbles, and painted blinds,

Several of the ceilings under the galleries of the Exhibition Building have been decorated with more or less taste, principally in the arabetque style. One, painted by Signar MONTANABI, of Milan (738, p. 1044), in one of the Austrian apartments, deserves particular notice: it is a coved ochiag, executed with great breadth of effect. The imitation of gold is excellent, and the general

errect. The institution of good is exceiters, and use general reatment is fall of spirit and force. In wall decoration Mr. Monany (164, pp. 745, 746) exhi-hits a landsome panel, mounted with gilt ornaments and mouldings; the Inter upon a ground of looking-glass. In the centre of the panel is pinited in figure arroyanded by foliage nrabesque

Mr. Moxox's panelling (252, p. 754), nvcr a chimoey-piece, by Mr. Thomas (252, p. 754), in the English Fur-niture Court, is a tasteful specimen of decoration; and the imitations of woods and marbles by this gentleman are executed in a very superior manner, united with an ornameatal character of a high class.

Messrs. Hollann, of Warwick (407, p. 760), exhibit table-tops in imitation of marbles, ornamentally arranged

in the old Italian style, with good effect.

Mr. Kershaw's imitations of woods, Class XXVII. (1, 764) are also very excellent; and those by Messrs p. 764) are also very excellent; and those by Messrs. Nicola. and Allen, Class XXVII. (69, p. 768) of wood and marble, have likewise considerable merit. Some of these imitations of woods are painted on glass, the

these imitations of woods are painted on gass, the polished surface of which gives great finish to the work. Among the painted blinds, of which there are many axhibited, those by M. Bater Pasks, of Paris (1061, p. 1229), were considered good speciment. The wax-cloth hangings, by M. Vyær, of Paris (774, p. 1215), are painted ornamentally in the style of Francis I, and are stated to be so prepared as to resist the effect of moisture.

Paper-hangings.

Paper-hangings form a manufacture of considerable importance, carried on in most of the principal cities of Europe, employing many artists and designers, and thousands of operatives, consuming also wast quantities of paper, colours, wool, and metal. They are important also, because they may be made the means of extensively diffusing taste for mrt; and from the low price of the cheaper kinds, enabling the humblest mechanic to give to

his home an air of elegance and comfort It is difficult to determine the period when paperhangings were invented. They are supposed to have been first made in China, and the introduction of these hangings into Europe probably suggested the manufacture here.
They may be divided into three kinds—the flock, the
metal, and the coloured; and each of these seems to have been invented at a different time as an imitation of a distinct material. The flock, to imitate the figured tapestries and stuffs; the metal in imitation of the gilt leather hangings; and the coloured as a substitute for

painted decoration. It is generally allowed that flock-hangings were first manufactured in England, and invented by Jerome Lanyer, who obtained a patent in the reign of King Charles I., dated 1st May, 1634, and carried on his art in

London,

In this patent it is stated, "that by his endeavours he
hath found out an art und mystery of affixing wool, silk,
and other materials of divers colours upon cloth, silk, cutton, leather, and other substances, with oil, size, and other cements, to make them useful for hangings and other occasions, which he calleth Loudriniana; and that the said art is of his own invention

M. Savary, in his Dictionary of Commerce, 1720, saya that touture-de-laine or flock-hangings were first made ut Ronen, but in n coarse manner, being only used for grounds, nu which, with flocks of different kinds, were furmed designs of brocades. They essayed to imitate tapestry-hanging, but not satisfactorily; and at last a manufactory was established at Paris, in the Faubourg St. Antoine, and there flowers and grotesques were introduced with success.

The manufacture is thus described by him: - "The artist, having prepared his design, drew on the cloth with a fat oil or varnish the subject intended to be represented; and then the flocker, from a tray containing different tiuts of flocks, arranged in divisions, took the colours he required, and sprinkled them in a peculiar manner with his finger and thumb, so that the various

masher with his hoger and thumb, so that the virious shades and colours were properly blended, and an imita-tion of the wove tupestry produced." These descriptions, though detailing the mannfacture of flock-hangings, yet do not allude to the use of paper as a ground, nor to blocks for printing. A French author, writing in 1723, says that paper-hangings, called tapestry in paper, were, till lately, only employed by the country people for their cottages, or by small tradesmen in their shops and rooms; but towards the end of the seventeenth eentury, the manufacture was raised to such a point of perfection and beauty, that, besides the quantities that were exported abroad, and to the principal cities of the kingdom, there was scareely a house in Paris not deco-rated with it. The manifecture at that time is thus de-

scribed:-The design, having been drawn in ontline on paper pasted together, of the size required, was then divided into parts of a suitable form, and given to the carver or wood-engraver, to cut the design on blocks of pear-tree, much in the same manner as at prescut. The outline thus cut was printed in ink, with a press, on separate sheets of paper: when dry, these were painted by hand in dis-temper colours, and afterwards joined together, so as to form the required design. Grotesques and panels, in which were intermingled flowers, fruits, animals, and small figures, were then executed by the above process. small neures, were trem executed by the above process, M. Reveillou, of Paris, is considered to have introduced many improvements in this manufacture, and was cele-brated for the beauty of his productions in the latter end of the last century. The pillage of the workshops of this manufacturer in the Faubourg St. Astoine was one of the first incidents of the Revolution in 1789. In England this manufacture continued from the time

of Lanyer, and obtained a high reputation. In 1712, a

duty of 14d. per square yard was imposed; and a Mr. Jackson, who established a factory at Battersen, for paper-hangings of classic design in chiaro-occuro, writes, in a work published in 1754, in praise of his own produc-tions, and condemns the function paper-hangings at that time so much used, comparing them with the Chinese,

In the year 1786, there was established at Chelson a manofactory for paper-hangings of a very superior de-scription, by George and Frederick Echardts. Works excelling even those of the present day were produced at this place; some of the blocks used are at present in pos-session of the writer of this Report: they have great merit in the designs, and are some of them 8 feet in length. These manufacturers carried the art to its highest point in England: they printed not only ou paper, but also on silk and linen, and employed a number of artists in addition to workmen and children. M. Sheringham,

of London, also excelled at that time in decorative paperbangings. During the present century the French have not only restored this branch of manufacture to a high state of perfection, but have also introduced many important improvements, such as the embossed flocks and the shading of flocks, the perfect imitation of chintz, improvements in the satin-grounds, and the introduction of work printed from engraved cylinders.

In England, the trade was protected by a daty of 12d per square yard up to the year 1846, when the late Sir Robert Peel reduced it to 2d. This high duty acted almost as an exclusion to foreign makers, and there was therefore no competition with them, nor any inducement to improve. Since that time, however, the English manufactorers have made great progress in their art, both in style and workmanship, the trade has greatly increased, and the improved productions are sold at a greatly reduced price. They have, besides, applied themselves to the improved application of machinery, by which very beautiful papers are made at an extremely cheap rate.

The process of manufacturing ordinary paper-hang-ings, as now carried on, may be thus briefly described:— The pattern being first carefully drawn, is then pricked, and the outlines of the various tints are pounced each on a separate wood-block made of poar-tree, mounted on These blocks are pressed on the sieves of colour, and then applied to the paper, each block following the other on the guide-marks left by the previous impression. An idea may be formed of the enterprise and labour required to produce some of the decorative paper-hangings for this Exhibition, by stating that more than 12,000

blocks have been employed on a single one of them. In making flock-paper, the pattern is first printed in size, and then with a preparation of varnish or Japan gold-size. When this is partly dry, coloured flock, preof whose products I am coordined it understates,

pared from wools, is sifted on the varnish pattern, to which it adheres. Great improvements have been made of late years in this manipulation, more especially by French manufacturers.

Paper-hangings, where gilding is introduced, are prepared much in the same way as for flock : the leaf metal is laid on the varnish pattern, or, if worked in hronze powder, it is brushed over with n hare's foot,

The English manufacturers have attained great perfec-tion in the preparation of metal papers. The gilding, having to encounter the damp and variable climate, is severely tested; but by menns of good material, careful manipulation, and a preparation washed over it, it remains unchanged for a considerable period.

Paper-hangings have been printed in England by means of hand machines for many years, the papers being made in lengths of 12 yards, or single pieces, in one or two colours, and these colours falling separately on the ground, It was not notil about ten years since what is now understood as machine printing was fully introduced, and this was done by Messrs. POTTER, of Darwen (74, p. 734), who, by means of steam-power, artificial drying, and an eodless roll of paper, were enabled to produce patterns with good effect by surface-roller printing in several colours, on the principle of calico-printing: specimens showing 14 colours were exhibited by this honse. Messrs. Heywood, Higginbotton, and Co., of Manchester (71, p. 734), have also effected great improvemeuts in the manufacture, and exhibit patterns showing 20 colours made by 14 rollers; and Messix, J. Woollams and Co., of London (322, p. 758), likewise exhibit excellent specimens made by machinery in addition to those they make by block-printing.

These machines are now each espable of printing from 1,000 to 1,500 pieces per day; and although the work is

not equal to block-printing in the solidity or permanence of the colours, yet the small price at which it is pro-duced commands an extensive sale, superseding to a great extent the chesper kinds made by hand

The above remarks apply only to paper-hangings of the cheaper qualities, for machine-printing has not yet been successfully applied to those with glazed or satin grounds. There is also another evil which it is most desirable to remedy-the colours are liable to run, without

great care, in the hanging. It is perhaps impossible to give the correct statistics of It is persays impossing to give the correct standards of the manufacture of paper-hangings. A statement has, however, been prepared with some pains by M. Zuber, of Rixheim, which approximates to the actual condition of this hranch of industry in the principal countries of Europe and in the United States; but is founded on rather loose data in reference to this country, the result

There are very beautiful specimens of paper-hangings | considerable artistic excellence, but also show great proin the Great Exhibition; works which not only possess | gress in the manufacture.

Fines has just's required a high renorm for her works in this branch of idensity. M. Decouver, or Post, (1713, p. 123s), exhibits a supestry-like picture entirely printed by blocks, representing a chase in a forest, are printed by the proposed printed by the pr

productions, of Rixbeins, France (1556, p. 1250), exhibits one of his beautifully-accusted landscape paperaone of a series of works for which this house is no celebrated; it represents the threat vegetation of the four orthogonal properties of the properties of the four of the colouring and the perfect worksmoothip are allow the colouring and the perfect worksmoothip are allowed properties of the various kinds of paper-hangings, &c. 1

Mears, Manea, of Paris (327, p. 1192), chibits a picture representing a garden scoue—a very elever example of paper-printing, left, perhaps purposely, in a state where a few touches by the hand of a clever artist would complete a beautiful effect. A well-executed figure in a panel, and other decorations of flowers and ornaments, heides some perliamens of the more ordinary of this house.

The English manufacturers of paper-hangings have produced many beautiful specimens also, both as decorative, damask, chintz, and tlock-papers; those made by

machinery have been previously alliaded to.
Messers Townstein and Pankars, of London (Silks,
p. 78%), exhibit paper-banqings of various kinds, of
control of the property of t

Messrs. Swalls and AIMERWANN, of vienna (63), p. 1041), exhibit paper-hanging decorations for ceilings, &e., in good taste. They have also adapted the process of block-printing in distemper colours, as a sheep form of illustrating works of science and art: the specimens they exhibit give illustrations of machinery in isometrical perspective, very beautifully executed.

M. Davis, of Brussels (Belgium, 401, p. 1163), exhibits

M. Dzvis, of Brussels (Edgium, 401, p. 1163), exhibits a large collection of paper-hangings, more particularly in flock, of excellent execution.
MM. Ratw and Virtren, of Warsaw (Russia, 262, p. 1373), have forwarded a collection of paper-hangings, which possess considerable merit, both as regards design,

colouring, and execution,

Japan Ware. The articles under this head form an interesting series, and include the products of India, China, France, Ger-

many, and England.

Japon ware may be divided into two elasses; works lacquered upon wood or metal grounds, and those formed of papier mache; these last are superior to the former, being lighter, sounder, and admitting of a more beautiful

Japan ware derives its name from the lacquered ware manufactured in Japan, and introduced into Europe towards the end of the screnteenth century. The inquered work of that country is of a superior description some of it higher in quality even than the Chinese, which is also very beautiful, and is very extensively manufac-

It is called lacquered ware because the articles are Paris, one of our Ju coated with varnish prepared from lac. This lac is a mode of japanning.

resinous gum, the sap of a shruh Tsei-shoo (Rhus vernix) in Japan, and of the Asyia Sisensis in China; the julce thence extracted is of a poisonous nature, and great caution is required in collecting it.

The method of applying the lacquer in China is pur-sued as follows: "—" The article to be ornamented, if formed of wood, is always very dry, light, and smooth: it is first costed with a preparation of ox-gall and rottenstone; this is rubbed to a smooth face and then varnished. This varnish is thus composed: 605 grains of fine gum lac are put in 1,200 graius of water, to this is ac 38 grains of oil of Camellia sasanqua, a pig's gall, and 19 grains of rice vinegar. The whole is well mixed in 19 grains of rice vinegar. And whole is wen minted in full daylight, the lac gets deeper and deeper, and the varnish shortly becomes a brilliant black; a very thin coat of this is laid on with a fist hair-brush. The article is left in a steamy beat, and at length comes into the hands of a workman who rubs it down in water with very fine pumice. The work then receives a second coar of the lac varnish, and after that a second polish, and these two operations are successively continued till the surface is perfectly even and brilliant. As the operation advances, a still finer quality of lac is used: there are never less than three coats laid on, nor more than eighteen, The decoration of the object is confided to an artist workman, who first draws in the design with white-lead; if he is satisfied with the sketch, he engraves it, and fills in the thousand little details of the subject. There then remains only to paint with the campborated he of Kouang-si, which serves as a mordant on which to gild either with leaf-gold or powder. The reliefs are obtained with one or two coats of hos-kinn-tsi, and these gilt designs are then enriched with the lac of Fo-kienn Little is known of the fine lacs of Sou-tchou and of Lattle is known or the one less of concentration and the Nama-king; the price is very high; this is explained by the cost of the work, which requires the application, the hardening, and the polishing alternately of eighteen or twenty coats. In their lacquered objects the purity and betalties of the versity the infinite reporters of the versity the infinite reporters of the brightness of the varnish, the infinite minuteness of the decoration, and the finished workmanship of the furniture, are must admirable. In the work from Japan, pieces of mother-of-pearl cut to form are inlaid in the lacquered grounds, and the last coats of the varnish are polished with a reed.

Several interesting specimens of Japan ware are exhibited from China, particularly a very elaborate folding screen by Mr. BRAINE (19, p. 1424).

Engined has obtained some eelebrity for her Japan ware executed in papier massle. Aloud a century ago, Mr. Baskerville, or disrimispham, manifestured extensively japaness into metersys, ée, and a pupil of his, which is pricelar manifestured in this pricelar manifesture in 1760, and obtained a patent for the same to this invention is owing the importance which this hranch of trade has sequired, not only from the greater perfection of form and appearance this material is susceptible of, that also from the larger this material is susceptible of, that also from the larger Meerur. Justices and Berratice, of pliminghams only

London (187, pp. 186, 200), are the largest mounther mount of this material in Exploit; they have been established about thy years, and have introlved many improvement, speciation of each to Japan ware, and that first have, from their enterprise and man, greatly developed that the enterprise and man, greatly developed the enteror a plane, are among the entiles writery of objects to Talkes, chairs, rearen, work batter, inclusion, portfolion, even a plane, are smong the entiles writery of objects to elicetic or, Japaneau Ware, exceed that in paper made and other materials; the most conspersions among made in other materials; the most conspersion among made in paper model, Japaneau black, and infinit with mather-d-point; the oriminates of this piane are in pool made and the materials; the oriminates of this piane are in pool made and the materials; the oriminates of this piane are in pool made and the materials exployed, which, being executing in small the materials exployed, which, being executing in small

* I am indehted to an article by M. Natalia Rondot, of Paris, one of our Jury, for this description of the Chinese mode of ispanning. pieces, would have probably told with better effect if arranged in the form of monics. A white-tray, and many others of the specimens where the principles of the design that the specimens where the principles of the design that the surf-boxes, too, the introduction of the jevelide work under glass is appropriately designed and well exceeded, and forms a presty addition to the spatie where the specimens of the specimens of the specimens such as a reclining chair, a cot, tables, &c, however well designed and ingeniously executed, did not appear suitable to the sutterful. The Jarry, severtheless, recognise and the specimens of the specimens of the specimens of the available of the sutterful. The Jarry, severtheless, recognise available to the sutterful.

In 1832, Mr. Brindley, of Birmingham, obtained a patent for producing papler maché articles by pressure between dies, either in wet sheets or in the form of pulp; this is employed for a cheaper kind of objects.

In France this manufacture has also obtained considerable success, though there are no objects exhibited. In Holland, Belgium, the Zollverein, Austria, the art of japanning is carried on, but not so extensively as in England.

Associated with the papier-maché ware is the intraduction of initation levels on colonred grounds nuder plaus; these are cemented to the nuder surface of the glass, which is also dispered over with gold, and the ground is then painted the required colour, a foil being fixed behind the glass levels.

Another variety has also been lately introduced; that, where lamine of mother-of-pearl are fixed behind glass, and so associated with the pictures or ornaments as to produce very beantiful effects. Mr. LANK, of Birmigham (128, p. 742), exhibits some excellent examples of this work.

Messra. CLAV and Co., of King Street, London (189, p. 749), are the representatives of the descendants of those who invented this mann feature; they exhibits large selection of articles of papier maché, among which many of the ten-trnys are of very good design and execution.

Messrs, Halbrant and Willings, of Birmingham (131, p. 342), exhibit a handsome toilet table in the Elizabethan style inlaid with mother-of-pearl, in addition to many other specimens. Mr. Walton, of Wolverhampton (Class XXII., 70),

Mr. Watron, of Wolverhampton (Class XXII, 701, p. 668) exhibits some teartrays of good design, where the principle of the ornamentation is founded upon geometric forms, depending on ontline and contrast of colorn, not on imitation of relief. The large table in papier maché, well painted in flowers, is also a fine specimen of the manufacture.

Mesers, Spirrs, of Oxford (70, p. 734), exhibit numerous examples of papier maché, many of them beautifully ornamented.

Messrs, Bernen and Kronick, of Vienna (643, p. 1040), exhibit japanned screens well executed, besides other objects. Mesers. Zezorus, of Amsterdam (96, p. 1148), exhibit a folding sercen, in which the execution of the various details in excellent, and the peculiarities in the Chinese work admirably sustained.

This Jury feel called upon to remark on the redundancy and inappropriateness of much of the ornament applied to the European specimens of Japan ware; and to direct attention to the better examples of this work from Japan and China, where i will be found that in the subordinate parts the ornament is kept subdued and simple, thereby giving more effect to the principal features.

Ornaments in Relief Mechanically Produced.

Messrs. Biklyeld, of London (157, p. 744), exhibit many specimens of this manufacture, as do also Messrs, Jackson and Sons, before mentioned.

Stamped Leather.

The mannfacture of this material was revived about fourteen years since at Paris, with many improvements apon the old leather hangings of the seventeenth and eighteenth centuries, as regards the perfection of embossing the ornament.

The old leather hangings were made by a comparatively simple process, without the aid of machinery. The skins being properly moistened, were laid on a mondo of the embossed ornament: into the various parts of this mould the leather was pressed by small wooden tools, till it a captired the emboased pattern; when dry, the leather was coated with silver-lenf, and varnished with lacquer to produce the colesn of gold. After this the proper colouring was laid on by hand, and certain parts of the leather stamped by a hand-punch to produce the small

figure peculiar to some kinds.

In the French revival of this manufacture the ornament is stamped by hydraulie pressure, producing very perfect and very high relief; to prover the relief subsiding as the leather dries, the reverse of the leather is covered in the embossed parts with some composition. Mesers, Deuzo, of Paris (1202, p. 1253), at present prepresent the hones which first unamfactured by this im-

represent the house which first manufactured by this improved process: they exhibit many specimens of good design, and showing the excellence of the emboss. Mr. Leake, of London (Class XXX., 63a, p. 823), also

Mr. Leake, of London (Class AAA., 63a, p. 823), also exhibits a collection of specimens of leather embossed by the same process, many of them of good design.

Carving by Machinery.

Mesors. Jorday and Co., of London (80), exhibit various specimens of carred work executed by machine to favor a large Gothe cols serven, deal game, foliage, &c. The operation of this machine is by a series of drills, pointed from a mydel; where there is a considerable repetition

Coalogue

NATION.

of the same ornament, this machinery can be employed with very great economy, but the work requires finishing by hand.

Conclusion.

The Jury have earefully examined the various works in this Class, numbering probably more than five thousand objects; there were many works of very considerable cost and labour, which they would have been able to the state of
The Jury onanimously regretted the withdrawal of the Third Medal; if this had been retained they would have been able to discharge their duties more satisfactorily to themselves, and they think also to the exhibitors. They are bound to add, that they were only empowered to recommend certain names for the distinction of the First or Council Medal, and that the Council made a selection from that list.

Gronout Low, C.E., F.R.S., 39 Finsbury Circus; Englacer to Chartered Gas Continuous.

The objects taken into consideration by the Jury of Class XXVII., and defined by the general term Mineral Manafactures, have been understood to embrace a very great variety of articles manufactured in stone, marble and clay. These may be, conveniently enough, grouped into two principal divisions: the one including all dressed, carved, sculptured, and polished work in solid material; whether stone, marble, granite, or other mineral sub-stance; and whether solid, wrought, or inlaid in stone; while the other includes modelled and moulded work in clay, ecement, certain kinds of glass and pottery, and arti-ficial stone. The difference is essential between these two kinds of work, which are rarely undertaken by the same artist. Each of these divisions is capable of arrange ment into groups, as follows:-

Division L.- Works in Solid Material.

Group 1. Unpolished stone,
,, 2. Polished and inlaid work in stone, marble, granite, and pietra dura,

Division II .- Works in Plastic Material. Group 3. Coments and artificial stone. , 4. Clay.

To these there may also be added a group of mis-eclianea, which will not be found very numerous. It will be convenient still further to subdivide these comps in speaking of the exhibitors, scriatiss, and the ists may be arranged in the following order :-

Division I.

Group I.-MANUFACTURES IN UNPOLISHED STONE. A. Flagstones, pavements, &c., roughly dressed.

B. Carved and sculptured works in freestone,

granite, &c. a. Large monumental works. Smaller works in granite,
 Works in Caen stone,

d. Works in liath stone. c. Sundry works in freestone. Slate

D. Sundry materials.

Group II. - MANUFACTURES IN POLIBRED STONE, MARRIE, AND OTHER SIMILAR NATERIALS.

E. Manufactures in marble and alabaster. a. Collections of marble.

b. Chimney pieces. e. Columus, pedestals, &c. d. Slabs, tables, &c.

e, Sundry objects,

F. Works in ornamental stone, granite, and spar,

a. Serpentine, granite, and sprange, and sprange, and sprange, and sprange, and sprange, and sprange, b. Jasper, jade, agate, crystal, and spar.

G. Moaies, or inlaid work in stone.

a. Iulaid work in pietra dura.

b. Inlaid work in marble.

c. Iulaid work in malachite. II. Polished and cuamelled slate.

Division II.

Group III .- MANUFACTURES IN CEMENTS, SCAGLIGLA, AND ARTIFICIAL STONE,

I. Massive and enerusted cements, scagliola, and plasters. a. Hydranlie coments.
b. Plasters and scagliola

c. Artificial stone with silica base,

d. Bituminous cements. e. Metallic cements. K. Glass and porcelain mosaics (including Roman

mosaie). a. Roman and Venetian mosaic, b. Porcelain mosaic.

Group IV .- MANUFACTURES IN CLAY.

L. Bricks and tiles.
M. Term cottas.
N. Fire-clay goods, unglazed.
O. Glazed fire-clay goods.

It will at once be seen from this arrangement how considerable a variety of subjects must be treated of in this Report, and the important relation they bear to almost all unestions of construction and decoration. With the exception of those building stones which are included in

reward.

metallic mineral substances used for construction and decoration, may be considered as referred to Class XXVII., and it will be found that many manufactures of great interest require to be described and discussed.

The Reporter-not having the requisite technical and statistical knowledge of all these manufactures, himself -has endeavoured in various cases to obtain it from anthentic sources; and where any new method has been introduced by exhibitors, he has attempted to make him-self acquainted with it. He has also tried to obtain and communicate information, wherever there appeared anything remarkable in the manufacture, even where this was not, in any sense, new. The Report will thus contain the result of various inquiries, as well as the observations of the Jury, on the different objects considered worthy of special notice.

In order to assist them in coming to a right decision on some subjects as to which they required technical information, the Jury have called in, as Associate Jurors, the following gentlemen, to whom they beg, here, to offer their best thanks for the valuable assistance rendered :-

F. BARKER, Esq., for polished marble and inlaid work

T. II. HENRY, Esq., F.R.S., for chemical utensils. GEO. LOWE, Esq., C.E., for fire-clay goods.

It is difficult, amid such a multitude of objects, of natures so widely differing, to offer any useful general remarks on the whole Class. Apart from the works forwarded by English exhibitors, whose number more than equals that from all other countries together:-(and who have sent much that is interesting in carved stone, slate, granite and porphyry, serpentine, moraic work, coment and scagliola, bricks, fire-clay goods, and salt-glazed ware ;)-it may, however, be well to allude particularly to the malachites and jaspers of Russia; the mosnics of Italy and India; the bricks of Austria; the carved stone of Malta; and the term cottas of France, as among the most important of the objects exhibited from abroad. The selection of material, and the method and perfection of the workmanship, have generally entered into the consideration of the Jury, as well as the adaptability of the material, and the economical production of a useful manufacture; and thus it will occur that here, as in other cases, similar prizes have been awarded to ob-jects of very different degrees, as well as different kinds of merit. In their recommendation of objects for the Conneil

Medal, the Jury have thought it their duty to limit themselves to such as exhibited decided novelty, in addition to erreat merit of design and execution. The claims of the Society for the Improvement of the DWELLINGS OF THE LABOURING CLASSES (124, pp. 774, 775) are so considerable in both respects, as well as in an economic point of view, that they have been at once admitted. They involve a vast improvement in style, safety, and cheapness in the construction of dwellinghouses, and this in the very cases where improvement was most needed, and most likely to conduce to decided sanitary improvement among the great masses of town

populations.
To Mr. Minton (86, p. 770) we are indebted for introducing very many and important improvements in eneaustic tiles, thus restoring a mannfacture which had long been extinct, by the application of a method more generally available than that originally adopted; and to generally available than that originally adopted; and to his enlightened appreciation of merit many modern improvements in pottery are due:—these claims were fully recognised by the Jary and Group of Juries, who recom-mended the award of a Council Medal, which was conceded by the Council of Chairmen jointly with that recommended by another Class (Class XXV.) for articles directly connected with the manufacture of poreclain With regard to the manufacture of Roman mosaic it

need not be inquired whether the finished work of art by the Cavalier Barseau (Rome, 15, p. 1286), selected as also worthy of the Council Medal, is really the most perfect in its kind, or more excellent, both in design and exceution, thus any that exists in this country; since we may safely say that it is of the rey highest order of merit, referable to Class L, and are reported on by the Jury

while the manufacture itself, though not modern, nor involving any peculiar novelty, has in this case the advantage of originality of design and great ingenuity in treatment and execution.

The remaining group of objects to which a similar reward has been voted, namely, the collection of Russian malachites exhibited by the Messrs. DENIDOF (Russia, 323, pp. 1377—1381), offers examples of a manufacture remarkable not only for the rich magnificence of the articles, but also for a great improvement in style and execution which will be afterwards explained; so that little doubt could exist as to the propriety of rewarding the exhibitors with a peculiar mark of distinction.

If it had been possible to do so, the Jury would also have been glad to mark in the same way the great im-portance they attach to the extensive and admirable manufacture of bricks, belonging to Mr. Mikanacu, of Vienna (610, p. 1038); to the remarkable works in jasper and hard porphyry, exhibited from Russia and Scandi-navia; and to some of those beautiful and admirable works in pietra dura, sent by the Florentine artists; but the regulations not admitting of this, they can only here allude to these objects as among the most remarkable in their class, and proceed at once to discuss the various groups of objects in regular order, stating the reasons which have guided them in recommending some for

Before concluding these preliminary remarks, the Jury wish to record their admiration of the rare works of was to record their admiration of the rare works of manufacture belonging to this Class, exhibited by the Honourable East India Company (p. 921). Among the various examples of inlaid work in pietra dura, not one is more perfect in its kind, or exhibits more delicate and artistic taste, or greater mechanical excellence, than a small chess-table in their collection. Next to this, they may mention as remarkable for delicacy of workmanship, the manufactures in a peculiar white murble of considerable beauty, cut into garden-seats, &c., and also many smaller objects, and ntensils hardly less striking. The enps and other vessels, and various ornaments, manucapa and other vessels, and various ornaments, manufactured of jade and crystal, and for the most part inlaid with rubics and emeralis, are examples of great labour and ingenuity applied to a manufacture rare in this country, and in Europe generally, but long known and excresised in the East. For those, and many other manufactures, the Exhibition is indebted to the exercison made by the officers of the East India Company, acting on the instructions received from the Court of Directors in England. The Jury regret, however, that their igno-rance of the names of the manufacturers has prevented them, in many cases, from rewarding them with Medals and Honourable Mention.

DIVISION 1 .- WORKS IN SOLID MATERIAL. Group 1.-MANUFACTURES IN UNPOLISHED STONE.

The total number of exhibitors in this group is u wards of eighty, of whom about sixty are British, five Maltese, and a few from India. The remainder are Maltese, and a few from India. The remainder are distributed as follows:—five French, two Belgian, two Italian, and one from Austria, Sweden, Spain, China, and the United States. The objects being for the most part heavy, and of rather large dimensions, the cost of trans-port has no doubt checked the transmission from a distance of many that might otherwise have been sent, But it must also be stated, that several of the raw materials properly referred to Class I, might have come under consideration here if they had not been so manifestly connected with that Class; while, on the other hand, some, though but few, of those now regarded as sculpture, &c., might almost be claimed fur the present Class and

Many of the most interesting objects are of very great -almost national-importance, and some are certain to have attracted much notice; others again are small, und offer little at first that is likely to command attention

A. FLAG-STONES, PAVING-STONES, &c.

for that Class, so far as the name and value of the rew material is concerned. All present it is rather in reference to the named of the control of the considered; and the reader is referred to the amotations in the Illustrated Catalogue for some information regarding the nature and geological position of several of the more interesting among them.

intérestiga among them.

some pattern as the national tile is 2a, 5d, per square foct. Besidest the bituminous linestone, there is a flag-stone worked at Spanish Head, not far from Castleman
stoses and paving.

The Irish finge exhibited are few, and hardly sufficient to justify any extended description. The principal are those sent by Mr. Franxtan, of Galway, and appear to be of good quality (Outside, 17, p. 114).

The Welsh paving-stone from Penmacen-mawr is re-

The Welds paving-stone from Pennaconaavs is remarkable as being both the hardests and toughest material for road-stuff that has yet been discovered. It is indeed so hard as to assume a gipasy surface after long-continued exposure, and actually become diagerous from this cause. It is a traperok, and appears to be abundant. Bixed with sea hard material, it might in many London.

Dendon, and the distribution of present resources in London.

The specimen of Scotch granite paving exhibited by R. SEY (Chas. I, 137, pp. 138, 169) is of excellent quality of the Large part of the La

or such outpers.

Some beautiful specimens of slate flags from the quarries at Festining, North Wales (12, p. 114), are worthy of
Honourable Mention (awarded a Prize Medal by Class 1),
and careful attestion, as presenting a cheap and admirable
parement of great beauty, and in slabs to large as to
prevent much chance of an irregular surface being produced when much used.

The flags are of fine quality, and have had a severe trial at the Transept entrance of the Building, where some millions of footsteps have hitherto failed in producing any mark of unequal wear.

It is not astonishing that naterial of the kind we are now considering, hardly appears except from the various parts of our own country. From Belgium, Mesare Zanan (136, p. 1185) have forwardle Models of paving-stones and other manufactured atone of this kind, and of them the Jury make Honourable Mention.

A pavenue it scabileted by M. Desauoes (France, 1184, p. 1234), manufactured of a stoue called Pierre de Tonnerre. It is in compartments, tolerably large, and well exceuted, the material being well adapted to the purpose. The same exhibitor sends also a chianney-piece and other works, which will be described desewhere.

B. CHISELLED, CARVED, AND SCULPTURED STONE-WORK,

NOT POLISHED. a. Large Monumental Works, chiefly constructed of Granite.

These noble monuments, of excellent material and good workmanship, and remarkable for the public spirit which induced their respective owners to incur very great expense in preparing and transmitting them, may be considered as permanent records of the good feeling that has been perhaps the most characteristic feature throughout the preparation of the Great Exhibition. Three of these objects, of large size, are from Corawall, and are fine specimens of the granites of that conaty. Another is a highly-interesting and more finished specimes of Swedish granite, by no means so large as the former, but hardly less remarkable. There is also one exhibited in the Nave, constructed of Caen stone.

The granite column sent by the CHEESEWRING GRA-NITE COMPANY (Outside, 54, p. 117) is a very beautiful specimen of a stone obtained from quarries hitherto little worked, on property beloaging to the Prince of Wales, near Liskeard, Corawall, The shaft, cut from a single block, and worked at the quarry, is highly creditable; and the pedestal and base, worked in London, are in good and the potential and onse, worked in London, are in good proportion and well executed. The capital is rather heavy. The total height of the column, ped-sentl, and base is about 30 feet. For the material, style, and workman-ship of this column the Jury Bave awarded a Price Medal, The obelish sent by Mesers. W. and J. PREEMIN (Out-

The obelisk sent by Messes, W. and J. FREENEN (Crus-side, 14, p. 114) is from Lamorna granite quarries, Corn-wall, well known for their excellent material. Its height is npwards of 22 feet, and its weight 21 tons. It is placed on a block of Carnsew granite, weighing 31 tons. The difficulties and expease incurred in quarrying, removing, and placing objects of these enormous dimensions can hardly be judged of by those who merely see the finished The preparation and erection of an obelisk formerly the work of years, and still involving enormous labour and trouble, was, in this case, completed within a few months, merely as a sample of the nature of the nu terial and the resources of the exhibitor. A Prize Medal has been awarded for this work."

Mr. Hosken's obelisk (Outside, 75, p. 118) is from No. 2 granite quarry in Carnsew, near Pearyn, the pro-perty of the exhibitor. It is 18 feet high, about 3 ft. 5 ia. square at the base, and 1 ft. 6 in, square at the top. The weight is about 8 tons, and it stands on a granite block from No. 14 quarry in Killieven, in the parish of Con-stantine, also weighing about 8 tons. Both granites are stantine, also weighing about 8 tons. Both granites are of excellent quality, that of the obelisk more especially, e grain being fine, and the colour very good. A Prize Medal has been awarded.

The cross exhibited by Mr. KULLGREN (Outside, E. The cross exhibited by Mr. KULLERKN (UBLISSE, T., 100, and Sweden, 118, p. 119), and worked from a sin-gle block of granite, is remarkable for the extreme forceres and closeness of grain of the stane, and the deli-cacy of finish which its texture permits. The stone is obtained from extensive quarries on the island of Malmon, on the west coast of Sweden, whence the transport to this country is easy and cheap. It bears a high polish, and the cost of wages in the district whence it comes being very low, there is good reason to believe that it might be exported with advantage. The actual cost of a similar object has not, however, been ascertained. The Jury have awarded a Prize Medal to the exhibitor of this monument

b. Smaller Miscellaneous Works in Granite, Porphyry, &c. Concerning these objects, the Jury have but few remarks to offer. The cenotaph exhibited by Messrs, Port-

* It was probably owing to some needental misapprehension of the state of the casa that the Medal awarded to Mosers. Freeman for their noble collection of building stores in Class 1, was withdrawn in favour of the obelisk in Class XXVII. The Jory of Class XXVII. awarded the Medal for the obelisk as a manufactured block of grantia. remarkable for its dimensions; but according to the general rule adopted in other similar cases, the award of Class I. should have been retained, the Exhibitors being merchants and not manufacturers. LEU BROTHERS (France, 962, p. 1225), to which the Jury have awarded a Prize Medal, is a small object constructed of a kind of greenstone trap, whose chief merit arises from the difficulty of working a material so hard and tough. The style selected is impure Gothic, with several figures, and some open work. The execution is more elaborate than successful, and the work is left with a smooth face, without any attempt at further detail. smooth face, without any nttempt at torone of the small figures are fairly sculptured. The colonr and general effect are not very pleasing, establishment of these exhibitors is in the west of France. whence the material is obtained. A head-stone of Aberdeen granite, manufactured by

Mr. I. Wajoht (43, p. 766), is a beantiful specimen of material, admirably worked, and is worthy of special materian, admirably worker, and is worthy of special notice, as designed in good taste, well executed, and well adapted for its object. The Jury make Honourable Men-tion of this object, considering it as highly creditable to

the manofacturer.

The hist and pedestal of hise Peterhead granite, worked and exhibited by Mr. John Hurchison, of Monyray, near Peterhend (Class L, 161, p. 137), is also a creditable and interesting specimen of its kind. Its ob-ject is chiefly to show the adaptability of a stone of excellent quality and great hardness to purposes of art exposed in the open air in cities, and the Jury consider it worthy of Honourable Meution, especially as they learn that it has been very rapidly executed, under cir cumstances of some difficulty, by a young man who had not before atteropted anything of the kind. The cost of not refere attempted anything of the kind. The cost of granite statues has been stated by Mr. C. H. Smith an nearly the same as that of bronze, and their durability, when exposed to the smoke and acid vapours of a town, is very much greater.

The slah of granite from Craignair, near Dalbeattle, exhibited by the proprietor, Well-wood Maxwell, Esq. (Class I., 134, p. 135), is from a well-known quarry of excellent material, adapted for ornamental architecture. The composition is a grey quartz, with white or flesh-coloured felsper, and greenish hornblende, often in bands: it is therefore a Syenite. Another manufactured object is of a kind of trap rock found near Edinburgh, which may here be referred to as useful for various purwhich may here be referred to as useful for various pari-poses, and extremely durable, if not very ornamental. The stone alluded to is not unlike that worked by Mesura. The stone alluded to is not unlike that worked by Mesura. Grantia. "It is, exhibited by Mr. G. Joinstrows, of Craigleith (Class L., 178, p. 138). The carting-stones, make of greenstone trap, and seat by Mr. A. Cassras (Class L., 26, p. 123), and Mr. J. Kar (Class I., 37, p. 120), are also interesting from the great tongishess of the valof which they are made-a quality greatly required for the use to which they are pot in the national game from which the name of cerling-stone is derived. The material is felspathic, with small grains of quartz and minute particles of hornblende. Lastly, we may mention the orunmental works in Scotch granite, chiefly of jewellery, exhibited by Mr. Jamieson (Class 1., 25, p. 123), and Mesers. Ellis and Son (Class XXIII., 12, p. 674), and remarkable for the delicacy and beauty with which they remarkable for the demany and beauty with which and are finished. These will doubtless he noticed elsewhere, so far as they claim admiration for taste and excention. We only refer to them here as showing good samples of manufacture of the fine-grained granitic rocks found in some parts of Scotland.

e. Works in Caen Stone.

The stone obtained from the quarries of Allemagne and others near Cace, in Normandy, has been used in ecclesiastical architecture for so many centuries, that it would be useless to trace back its history for the parposes of this Report. The rock is an oolite belonging to about the same geological period as our own oolites worked near Bath; but the colour is better and more uniform, the texture far closer, and the material superior in almost every respect. It is at first absorbent, but improves on exposure. It cuts with perfect facility, and is

* Institute of British Architects, Report of Meeting of 24th March, 1851.

thus admirably adapted for ornamental work in architecture, especially when sheltered from the weather. It may be had in blocks of any reasonable size and proportions, and is the finest and most valuable stone of its kind obtained from the secondary rocks. For certoin kinds of exposure it is inferior to some of the English colitic stones, but none excels it for internal work.

So readily worked and beautiful a material has naturally been selected by several persons to execute objects in sculptured stone worthy of the Great Exhibition; but it is, perhaps, somewhat remarkable that none of these come from France, where the material is so abundant. Of the exhibitors in this stone, the Jury have selected three as worthy of the Prize Medal, and one they Men-

tion Honourably. We may proceed to describe these more minutely. Mr. Myans (Class XXVI., 533, p. 761) exhibits a nnmber of objects sculptured in Caen stone, most of which are placed in what is called the Mediaval Court. These

imitative of English mediaval architectural decoration, and are chiefly, though not cotirely, ecclesias-tical in their uses. The execution of the stone-work is in all of them extremely good; the different objects are perfectly correct in execution, and the distribution of the details is effectually and well combined with unity of design, showing clearly the artist's knowledge of his subject and of art. A Prize Medal has been awarded to

The canopied niche, containing a figure of St. Peter, designed and executed by Mesars. Lang and Lgwis, of Bristol (53, p. 767), is good both in style and execution, and so creditable in every respect, that the Jury felt no difficulty in awarding a Prize Medal to these exhibitors. The stone is of fine quality, and the treatment well adapted to the The statue of St. Peter especially is delicately and skilfully worked, and the smaller figures of our Saviour and the Evongelists are well executed. At the same time it should be observed, that the drapery and pose of the figures are not strictly Gothic, although in good keeping with the architecture, which is distinctly defined and well finished, especially in the ornamental parts. The work is not cut out of a single block, which could have been done, although with difficulty, and in this respect it cannot rank so highly as a work in one piece of

stone would do.

The foat by Messrs. Manuerrs and Evers (91, p. 771), also rewarded with a Prize Medal, is a very fine specimen of sculptured stone, although there is a want of fa and fluish observable in some parts. The general style and execution is, however, excellent, and some of the de-

and execution is, however, excellent, and some of the de-tails of the figures are very beautiful.

A sepulchral monument of the decorative period, by Mr. II. Basway (32, p. 767), has been considered worthy of Honourable Mention. It is well conceived and well executed, and is creditable both in design and workmanship.

A cross of large size, sculptured in Caen stone by the Hon. Mrs, Ross, and exhibited in the West Nave (79, p. 852), is worthy of notice as being the work not only of an amateur, but of a lady.

In addition to these objects, there is a chimney-piece by Mr. FREWER, of Ipswich (5, p. 764), showing much skill, and having a number of minute but imperfectly finished details. The design is allegorical, but not earnnined defails. The design is antiported, who have con-ried out completely. A sigular mountment of new form (that of a three-sided prism) has been sent by Mr. Baken, of Southamptou (54, p. 767); and some small but creditable models, by Mr. Lacars, complete the list of sculptured works in Caeu stone. The quality of the stone is shown in some specimens in Class f. (No. 176, p. 772), exhibited by Messrs. LUARD, BEEDHAM, and Co. (p. 138), importers; and these are of considerable interest and value, as, in addition to recently cut surfaces, they include fragments which have been exposed for several centuries to the weather both in England and France. d, Works in Bath Stone,

The works in Bath colite are neither numerous p important. The material itself, although much used, is not capable of resisting the action of an English, and

especially o London atmosphere; so that few artists have thought it worth while to exert their talents on o stone of so little durability. The substance is some-times of good colour, works freely, and is obtained in considerable blocks; but it falls far short of Caen considerable blocks; but it falls far short of Case stone in every respect. A vase and pedestal, elihotrately carved and exhibited by Mr. VALUBAN (20, p. 755), show the extent to which the chief moy be used in it; and a bust of Milton, by Mr. Narman (40, p. 767), is o good sample of the whiter kinds, until adapted for internal architectural decoration. Mr. Plows (34, p. 767) has seet a number of small article manufactured of the same sobstance

e. Sundry Works in Freestone.

Purbeck stone and Porbeck marble, materials susce tible of polish, and formerly much used in ecclesiastical orchitecture, are exhibited in a sculptured form by only one person, Mr. Wxnnan (Class XXX., 149, p. 830), who has sout a design for a tomb made of this stone, placed on a slah of the marble. The material is well adapted to church purposes when new, and retaining its polish; but that being soon lost, the surface becomes discolonred, and loses nearly all its former beauty. It is not much used at present, except for restoration

The magnesian limestone, till lately seldom used in the vicinity of London, is a stone of great beauty and value, and remarkable for its durability, at least in those parts of the country in which it is found. The best quarries appear to be those near Bolsover, in Derhyshire; and the stone has been selected from that neighbourhood for the construction of the external work of the flouses of Parliament. A specimen showing its qualities has been forwarded by the contractor, Mr. Gausser, and is exhibited in Class I. (185, p. 139). Honourable Mention is made of this work, as good of its kind, and well illustrating the use of the stone,

A specimen of freestone is exhibited by Mr. T. KING, of Morpeth (Class I., 136, p. 135), to show the quality of this material from Hartford Bridge, Northomberland, and the noture of the work of which it is capable. This has also been considered worthy of Honourable Mention, as a well-executed illustration of the use of o valuable material

A very interesting exemplification of the quality and decorative use of Craigleith stone is exhibited by the proprietor, Mr. James Gowans, of Edinburgh (Class I., 132, p. 135). The stone is much used for building purposes in Edinburgh, and the Redhall Quarry, from which the larger blocks were taken, is of excellent quality. It belougs to the carboniferous system, and is generally of lightish grey colour, fine grained, and almost wholly composed of pure siles. It is rather costly at first, but very durable, and may be worked perfectly for every architectural purpose. It contains a small per centage of The objects exhibited are two: one is a group of two

children (the Orphans), on a plinth of Binny stone, which is remarkable for the large quantity of bitumen tains; the other is a beroie statue of Sir William Wallace. Both are works of merit, and are especially valuable as demonstrating the capability of a stone hitherto not used in England for the execution of such works; and the Jury bave awarded a Prize Medal as a mark of their appreciation of the exhibitor's efforts to introduce a moterial nearly indestructible, and for so admirably illustrating its use.

In Class XXVII, there is a chimney-niece constructed

tu class AXVII. there is a chimney-prece constructed of a stone obtained from Cornwall, and known as the polyphant freestone. The material is hard, and is said to admit of a good polish, although this and another specimen exhibited are both varnished. The style of the chimney-piece is peculiar. The exhibitor is Mr. Barxi-DON (3, p. 764).

A Prize Medal has been adjudged to M. Desarrors (France, 1184, p. 1234), for two objects constructed in

. This bitumen is obtained in quantities so considerable that it has been used in the manufacture of caudies, of which specimens are exhibited to Class I.

Tomorre some, of which there appear to be distinct extension, and of this the seventies of our of fair appearance of the contract of the contract of the property of the contract of the Contr

orr., JOUNTESS, OF PERRIM (197, p. 1199), BIS EXHIBITED a pinnacle made of Ordain stone, which the Jury consider worthy of Hooqumble Mention, as well for the nature of the material, which is hard, even-grained, and well selected, as for the execution, which is tent and well faithful the design is tood and pure.

Several artists have sent vases and other objects sculptured in the soft stone of Malta, a material offering great facilities for working, but unt remarkable for beauty of appearance, having a peculiar dead-white colour resembling plaster of Paris. The delicacy of workmanship in these sculptures is very surprising, and, in some cases, also, there is much ingenuity shown, and much talent in also, there is natural injectively and the significant of the designing. The Jury have awarded Prize Medals to Mr. Decasane (27, p. 945) and Mr. F. Tiota (33, p. 946); and consider that the works of Messrs. Directs (28, p. 945), S. Tisera (30, p. 946), and Solera (29, p. 945), are worthy of Honourable Meution. There are also some similar objects sent by Mr. Foster, an English exhibitur (Class XXX., 303, p. 840). The stone, of which these vases, &c., are carred, is a yellowish-white calca-reous freestone, from forty to fifty feet thick, belonging to the tertiary period, and immediately overlying a semi-crystalline limestone, forming the base of the depo-sits in Malta and the neighbouring Island. Very large quantities of the softer freestone are used in the island for building and other purposes, and are exported to all parts of the Mediterranean. From Tuscany (97, p. 1293) a few articles are sent, sculptured in a kind of lithographic stone, found near

Flowers, and exhibited by Mr. S. Grovanstus, the preprietor of the quarry. The material is fine-grained. Several models of temples and other odifices are sent from India, constructed of a peculiarly sough but not considered to the property of the property of the varieties. A few of these are extremely well carved, and show great neutrons and finish in execution. Some of them have been colored artificially. There are also two small intrieved viluous of deletical upon stane-work, above and the property of the property of the property of the efergance of design. The material is of plensing color and appearance, and it, in these reports, supports o the

These wases, executed by Mr. SCHRYTERS, and exhibited by Sir Mooza B. AUGETTON (Class XXX, 161), p. 803), about much ingenity and publish about. The material is believed to the Gya and
C. MANUFACTURES IN SLATS.

The collection of split, sawn, and other mannfactured states exhibited by Mr. Throws Strukture, jun, of the Belvidere Road, Lamberli (Class L, 200, p. 141), exhibits such care in collection and arrangement, and much browthy for splitted so, colline a Prize Medal, Almost all the really important uses to which slate is applied may here be seen; and many new arrangements are shows, some of which at I text will be generally

adopted. Mr. Stirling cabibits a construction, consisting of an open cabinet of the sides, mode scutively of large sine sides from different quarries and districts, and remains of the sides of the sides of the sides of the parties of the sides of the sides of the sides of the non-time sides of the sides of the sides of the parties by a metalic discovered by the exhibitor, and adnosis by a metalic discovered by the exhibitor, and adlars selected reofung-sisten and also for the best quality, from the pinicipal quarries in the United Kingdom, as illustrations of the material and of the qualities of slate that the sides of the sectibility of the reaching the sides of the relaiset, or are exhibited within or now it.³

Besides the application of slates and slate slate in the ordinary way, and as already mentioned. Mr. Stirling exhibits illustrations or speciments, showing its use for exhibits illustrations or speciments, showing its use for exhibits illustrations are speciments, disries, slirings, and pis-feeding troughs, urisals, bend and foot-stores for graves, tundes, and measurement, clocks and usu-dials, sinks (cut out of a solid block), floors of conservatories, werehouse-floors, rulmy-astion paring, stables, and

To these various miscellaneous articles there is added a set of models of roofs, covered with different descriptions of roofsing-slate, in ten different colours. One of these roofs is covered with abla-slates, with a solid state roll to cover the joint, as arranged and proposed by the exhibitor. The slate recommended for make purposes is that from Coruwall, as it costs less for repairs than the Weish, and the colour more nearly resembles that of

In addition to these interesting and useful specimens of manufactured slate, there are exhibited several objects in enamelted and varnished slate, sow coming into use for various decourtie purposes, which will be noticed therebers. Some of these which will be noticed therebers. Some of the properties of the contract
In Districts Backenian, Eq. (21, p. 765), of the inland of Visientia, County Kerry, Ireinad, the Jury have also awarded a Prize Medal, for his monnfeatures in exhibited. The state from the south-west of Ireland, and especially from the Island of Videntia, in rot separable in being spit into fine roofing material as that and the evenues of its texture, render it extremely neful for vision purpose, both in building and for

Slabs of Valentia slate are early phrainable 50 feet long, four or five feet wide, and from six to twelve inches thick; and the quality, as seen by the specimens sent by the exhibitor, is, in every respect, excellent. The slabs, sand-bars, and roof-ridges are all good examples of the quality of the material, and the garden-sent sed table are quality of the material, and the garden-sent sed table are they are intended. The quarries of Valentia have emlorived as many as 200 persons at a time.

The OLD DELABOLE SLATE CONFAST (Outside, 8, p. 114) have exhibited, beddes some numnamiferared slates, a very large and well-cunstructed eistern of Delabole slate, canable of containing 2,000 gallons, and provided with a filter. The Jury consider that this deserves theoremshe Mention, as a fit and useful application of a material of good quality at a moderate cost. Several exhibitors have sent state cisterns, furnished

with filters, the mechanical arrangements of which belung to another Class. As far as relates to the material, and its application, the Jury consider that slate is ad-

• The states are from the following localities:—Penryn quarries, near Bangor; Lhanberis quarries; quarries of the Drootles State Company, near Cerentron; various quarries of Yesiniog and Machynilch, all these being in North Waies; and from the Betabol quarries in Cornwall, and various quarries at Coniston, in Lancashire; and Langdale, to Vestmoreland.

mirably adapted for such purposes. The exhibitors of such filters are, besides those already mentioned, Mr. T. STIRLINO, sen. (120, p. 773), Mr. STRUTHERS (Outside, 16, p. 114), and Mr. C. HON (109, p. 772).

A peculiar application of slate in the manufacture of coffins for vanits is illustrated by a model exhibited by Mr. J. Exasts (13, p. 744). The material is, perhaps, better adapted for such purposes than lead, and the cost may be less; but such means of preserving the human body in a state of partial decomposition are of question-

An inkrand, of very beautiful Pearlyu state (Class XXVII, 6.3, p. 67), mannfeured by I flowarane, of Llandegal, near Banper, is an ingenious and very carrellly worked illustration of what can be done with this material. The fury make Honocrable Mentium of it, as an encouragement to this kind of industry, and the esdeavour to make an useful and ornamental object of the only material which the exhibitor has defore in

The school slates of Messes, Dawaan and Co. (Class I, 208, p. 141) are of large size and good quality; and the same may be said of the slate ridges and rolls exhibited by Mr. D. Williams (Class I, 215, p. 142). The population in both cases is correct, and the manufacture

The model exhibited by Mr. J. Gronor. (Class I., 213, p. 142) is intended to show the applicability of slate in conjunction with iron to constructive purposes.

Three Companies exhibit collections of French slates,

Some slates of good quality are exhibited by Mr. S. Solzesi, of Chiavari, Sardinia (2, p. 1392). These include not only roofing-slates, but a table and polished writing-slate. They are fairly worked.

D. Manufacturas in Vanious rinks of Stoke and

OTHER MINERALS. Under this head are several miscellaneous articles,

such as steasie, or reag-stone, coal and jet, tuffs, &c., not very easily included under other headings. Though unimportant, they possess some interest, The steatite excelly, although as a pre-sed little used in this country, perties, and capable of being supplied from America and elevator in the steat of the stead of the steat
This Maximan Sear-Stream Cornear (Thiled States, III, 14), 14(1)) has recived likesomized better for articles, 14(1)) has recived likesomized better for the district likesomized better likesomized better likesomized propose, and exhibited by the Company. This state, the district likesomized li

The wholesale prices of blocks of steatite, delivered or board at Baltimore, are as follows:— Sawn or chiselled blocks, per cube foot, 1 dollar (4s, 3d.)
Slabs, per square foot super, 1 inch thick, 25 cents,

Is, 1d.)
Slabs, per square foot super, 11 inch thick, 28 cents.,

and more in proportian to thickness.

The manufactured articles would be supplied at corresponding prices, but it is considered that if the blocks cannot be admitted duty free, as raw material, it would be necessary to charge doubte the price quoted for selected

blocks tested for special purposes.

This steatile in a silicate of magnesia, and the form of it here exhibited is compact, of greyish colour, soft to the noneh, of specific gravity 2:65 to 2:8, hardly affected by sulphurie or muriatic acids, and little altered by exposure to intense hear. Other objects of steatite are exhibited from India, where the material appears to be abundant, and where it has long been need for household attendif.

A couple of vases manufactured of the tufn, obtained from the hot-water springs of Carlskad, are considered by the Jury worthy of mention, for the nature of the material. The vases themselves offer nothing remarkable. They are exhibited by Mr. Gorrt (Austria, 724, p. 1043). Several persons have exhibited articles manufactured or

oeveras persons have exhibited articles manificationed of cannel cool and jet, materials derived originally from the vegetable kingdom, but now existing in a mineral condition. These, although not sufficiently important to require any lengthened description, are interesting, especially the small objects in jet, from their manufacture giving employment to many persons in various parts of Europe.

Cained coal is chiefly used in the manufacture of gas, but some of the harder and more compact banks are considerably cut into various ornamental objects, several interesting of these as a finished work, well designed, and well exceeded, is a garden-seat, exhibited by Illis Royal Highesser Pairox Alaster (140), p. 177, manufactured the property of the control of the control of the property of Admiral Wemyss. The Jary consider that both for Martine and Control of the property of the canada well of the property of the canada when the property of the canada when the property of the canada when the control of the property of the cana

A will-constructed mobil of the Durham measurest Color angle of persons are exhibited by \$M_{\odot}\$ Ci. II. BLANK. This coal is chained from a pair of the New Table of the Color angle of

Jet is a material chiefly used for ornamental purposes, It is hard, hritite, opaque, searcely heavier than water, and takes a very high and beautiful polish. It is found in various parts of Europe, America, and axis Minor. In Roman Catholic countries, a large quantity of small ornaments (as crosses, beads, rosaries, &c.) is made of this material, and it is extensively used with us for mourning decorations.

decorations.

The principal exhibitors of jet are Messrs. SLAYER and Watorr, of Whithy (Classes I., 2, and VIII., 313, p. 121), where the raw material is obtained in abundance and in very good condition. Their articles belong to the class of jewellery. Another exhibitor of

* From an analysis forwarded to the Reporter by the exhibitor of these articles it appears that this variety of cannel yields as much as 15,000 cubic feet of gas per ton, English jet is Mr, GREENBURY (Class XXIII., 8, p. 673). The jet of the Asturias, which has long been known in Spain, is represented by some specimens forwarded by the town authorities of Oriedo (Spain, 33, p. 1331). These articles are sold at an extremely low price out.

The Jury might here refer to amber, as being a mineral production; but the articles exhibited paralle so closely of the nature of jewellery, that it is consolered better to unit uoticing the sobstance and its exhibitors in this Class.

Group 2.—POLISHER AND INLAIM WORK IN SYNEM, & Under this hand are included likeladed enterly mineral substances, as stone, marifice, althouster, granite, peoplew, puper, quarta, piles, rater, and present used in a positional decoration and use. The working, polishing, and intaging of several of these are generally in the same limite, go of several of these are generally in the same limite, in the property of the property of the property of granite property of the property of the property of quarter, jule, &c., on a peculiar summafracture, when perquirite, jule, &c., on a peculiar summafracture, when per-

formed on a large scale The total number of exhibitors in this group is about 120, of which those from the United Kingdom amount to something less than one-half. Tuscany and France take the next place in point of number and variety, but the most attractive objects are from the former country, consisting of mosaics or inlaid work, those from the latter being principally chimuey-pieces. Austria has four exhibitors, three of them Italian, and the objects exhibited are chimney-pieces, strictly Italian in character. Rome has three exhibitors, one of them extremely remarkable for the beanty of the workmanship shown, Italy is thus strongly represented, a fact which might have been antieipated from the habits and history of the people. Russia has long been celebrated for work in mitteral manufactures, and the exhibitors from that country have not failed to take this opportunity of showing the progress that has been made of late years in the processes of polishing and inluying, especially with regard to Fiorentine mosaic and vencering in malachite. From Germany there are several exhibitors, but the progress there made in the art of decorative work in marhie and mosaic does not appear to be well represented in the Exhibition, although there is one very creditable exception, showing that the polishing of granite is thoroughly anderstood in Berlin. Belgiam exhibits a few, hat very few, objects of The countries of the Peninsula are contented with sending their marbies rather as specimens of material than workmanship. It remains only to speak of Sweden and Norway among European countries, but these are extremely remarkable, and present good proof of a thorough knowledge of the art of granite-working in its best appli-

From the couth coast of the Nediterramean we have a few fine slabe schilderd from Egypt, though chiefly as few fine slabe schilderd from Egypt, though chiefly as fur the marklers, and also illustrating a manufacturer.  The Reporter is indebted to Messes. Hall, of Derhy, for the following account of the mode of turning and polishing marble, spar, and alabaster, as practised by them:—

The vigo rhomes a piece of market shout the rise required to relative the contract of the cont

very high polish.

This is the method, with a few trifling variations, by which all kinds of marble are turned and polished.

Fluor spar undergoes nearly the same process, but requires much practer care and skill on the part of the work-

man, as the spar, being exampored of a mass of crystals whose cleavage is in various directions, requires a more delieste manipulation than almost any other stone. Alahaster is a soft atone, and can be sawn with a crimor tootbaw, and is traved and polished in a very similar

and the Longill

The chief marble manufacture of England is in a part of Derbyshire, remarkable for its picturesque beauty, exteeding along the valley of the Derwent and its prin-cipal tributary the Wye, from below Buxton to Derby. cipal tributary the Wye, from below Buxnon to account The machinery for aswing and polishing was first established in Derbyshire, at the village of Ashford, near Bakewell, in the year 1748, water being the motive power. About the year 1810, similar machinery was erected at Rakewell. Both these works are situated near the quarries. Within a few years other works have been established at Buckland Hollow, near the line of the Midland Railway. These works give employment to upwards of seventy persons: about one-fifth work in the quarries: the rest are persons: anout one-time were not are marked marshed masons, polishers, &c., employed in part upon foreign marbles. Besides these three works, others have been established in Derby for many years.

The most important marbles of Derbyshire are the black,

the rosewood, the encrinital, the russet, or hird-eye, and a mottled dark and light-gray kind, occasionally containing namerous small corals. Of some of these there are several numerous small corals. Of some of these there are several varieties. Others might be added to the list of those found in the northern part of the country, one of which is a beautiful red, resembling the rosso antico, but it is obtained only in small blocks or lamps.

At Wetton, in Staffordshire, near the borders of Derby-shire, are marbles differing much from the above, but they have not been brought into any considerable use, and

are generally subject to flaws.

The black marble is of very fine colour and texture, hot

large slabs free from small veins of calcareous snar are The best quality occurs in beds of from 3 to 8 inches in thickness; some beds are thicker. This marble is, perlangs, superior to the similar kinds found in other parts of Europe, and is greatly valued for inlaying. It is tough, and contains a good deal of carbon, which imparts the colour. Within a very recent period the finer slabs have been inquired for, for exportation to Florence, Malta, and St. Petersburg, besides being used in Devonshire and

Derbyshire. Black marble is extensively used for ornamental objects such as vases, pedestals, chimney-pieces, &c., for which it is admirably edapted. It is occasionelly ornamented in various ways, as by etching, engraving, and inlaying. In the two former processes the polished surface is removed, and the brown colour of the rough marble exposed, and the brown colour of the rough marble exposed. Powdered white-lead is sometimes rubbed into the eached surface to increase the effect. By a peculiar process used at Derby, the brown colour is sometimes exposed without the polish of the marble being destroyed. The ornament produced by this process is more durable than the ordinary

etching. The reservood marble is extremely hard, and of close texture. The beds are of considerable thickness; but the most beautiful part of the marble is only about 6 inches thick. The name is derived from the marking of the

marble being somewhat similar to that of rosewood. The encrisital marble is the one in most extensive use. and contains very numerous fossils, consisting almost exclusively of the broken fragments of enerinital stems often entangled in coral. It may be obtained in blocks of

large superficies, and of a thickness of 2 to 21 feet. The resset, or bird-eye, takes its name from its colour and appearance, the shades varying from light gray to brown. It contains numerous minute fossils, also eneri-nital, and is found in beds of from 6 to 18 inches in

The dark and light mottled gray markle (called New-burgh marble), and the overlying bed, which is coralline, can be obtained from 1 to 2 feet thick.

The manufacture of Devonshire marble is much more

modern, and the material is generally less managenble. Almost all the beautiful marbles of this county, especially those near Plymonth, are fossiliferous, brittle, and very apt to contain veins and eracks. They are illustrated by some beautiful and interesting specimens, which will be

The columns formed of pieces of black marble and alabaster (exhibited in Class I., No. 146, by J. and G. Hall) show the various processes, beginning with the rough stems at the bottom, and endleg with the final polish at the top.

alluded to as the works of individual exhibitors. The marbles of Devonshire belong to an older geological period than those of Derbyshire, the latter being exclusively ut the carboniferous limestone series, underlying the coul measures and the millstone grit, while the former are of the Devonian, or middle Palaronoic epoch. The other kinds of marble, obtained from various localities, do not appear to involve any peculiar method.

of manufacture, nor is it necessary to give further details on this subject. It may well be supposed that the cutting and polishing of alabaster, a material much softer than marble, is in a corresponding degree easier. It is said that soap is used in polishing alabaster, and some of the objects construeted of this material are rendered trans-luceut by being soaked in some kind of oil. The chie The chief locality of this manufacture has long been in the north of Italy, near Leghorn, where the material is very abundant. A considerable number of alabater ornanents are now made in Derbyshire, chiefly from Italian models: those originated on the spot are not yet remarkeble for excel-lence of design. The material is obtained in that county in considerable quantities.

In proceeding to mention the different exhibitors in these materials, we may begin with an account of the series of manufactured murbles sent from various places.

a. General Collections of Marbles. There are several collections of marbles exhibited from

foreign countries, in which the specimens are at least partly manufactured, and some even finished, although the general intention in such cases seems to have been to exhibit them rather as raw materials than as specimens of manufacture. Many of them thus belong to Class I. (Raw Materials of the Mineral Kingdom); but others Class XXVII., and so clearly involve processes of manuartake so distinctly of the character of the objects in facture, that the Jury of this latter Class have thought it necessary to allude, however briefly, to them. To some of these they have voted Medals. The collection of Italian marbles forwarded by the

ROYAL TECHNOLOGICAL INSTITUTE OF TURCANY (TURCANY, Nos. 1 and 98, p. 1290) is of very considerable interest, and includes many varieties little known in this country. some of them remarkable for their beauty and excellen The Jury mark their sense of the value of this series by awarding a Prize Medal to the Institution by which it

To M. DEFEART (Portugal, 232 to 247, 250, 251, 259 to 274, p. 1310) a Prize Medal has been awarded, for a most interesting series of Portuguese marbles, of great variety and including many of considerable beauty. A fine col-lection of Pyrenena marbles is sent by Messrs, DEAVILLS, and Co. (France, 162, p. 1881), to whom also a Prize Medal is awarded (Prize Medal given by Class I, also); and an almost equally interesting series of specineaus from Languedoe is contributed by M. Carrost (France, 444, p. 1199), of whom Honourable Montion is made. M. Cotta (France, 1564, p. 1251), who has exhibited a series of polished marbles, granites, and serpentines from the Vosges mountains, is also Honourably Mentioned.

The GREEK GOVERNMENT (Greece, 26-49, pp. 1404-05) The GREEK GOVERNEST (Greece, 20-49, pp. 1404-16) has sent samples from some of those quarries whose reputation dates as far back as history can record, but they are not in a condition of manufacture to justify extended notice here. The marbles are decidedly inferior in quality to some of those obtained more recently in greater abundance from nearer localities, but if the quarries were properly and extensively worked, far better material might probably be obtained.

The EGYPTIAN GOVERNMENT (Egypt, 1-4, p. 1408) has been induced to open, of late years, the rich stores of oriental alabaster, a material celebrated in antiquity, and of which is made one of the most interesting works in mineral manufactures in the Great Exhibition.* The condition of this marble is very peculiar, but it would seem that considerable quantities of excellent quality might readily be obtained. It is a peculiar condition of lime-

* The object aligded to is the Tazza, by Mr. Dallamoda (Rome, 19).

stone (a true carbonate of lime), apparently formed in the manner of stalagmite, and on account of its peculiar tint and translucency was called by the anciests alabaster. From India are sent many specimens partly mann-

factured, indicating the existence, in that country, of valuable material more or less resembling our market, and suitable for similar purposes. A few of these are coloured, and the quality of the white marble is very peculiar. One of the coloured kind may be mentioned as it is from Bellays (Molrea, p. 86%), and is a magnenian rock, probably a variety of serpentine. Many of the harder materials inglist has be mentioned.

A small series of partly manufactured judes recently forwarded from China, by Dr. Bowatsus, is interesting on account of the material, which is, however, too difficult and costly in working to be much used for economic purposes, unless indeed mortars and peetles and some other objects for chemists could be manufactured of it if larger size than can now be made of agate, and at moderate

Many collections of marbles and other substances referred to this Class are not noticed here, because they are less decidedly manufactured. Takes as a whole, it cannot be said that these collections are in any sense complete; but they may, if afterwards brought together, form a nucleus of much value, which will suggest many manufactured to the control of the contr

b. Chimney-pieces.

The chimney-pieces sent for exhibition involves many differences in siyle and material, and are of so many degrees of merit that it were unreasonable to judge them all by one standard, or regard them from one point of view. Architectural decentation and subjust, beauty and all the contractions are supported by the consideration, and any other considerations, must all be taken into account; and they have endeavoured to select for reveal from the whole number those most

remetablish for each of these qualities.

Weature Colors of Latine Weature Colors are children on down kine market chimney, piece, for which, and several other objects in markle, at Prize Medal is avarded. Mr. TEXASYAT and Mr. LL (37 and 38, p. 769), exhibiting together several Derlyshire and other murbles, of which Heosornish Mendon in suite and other murbles, of which Heosornish Mendon in suite and other markets, which were the control of the co

There are several chimmely-pieces in Class XXII., which rather illustratesimprovements in stores than offer anything new or remarkable in marble working. One of them, bowever, by Messex, Tuoo, and JAREN XKEMO (1002, p. 603), in well executed and handsome, in a stone somewhat difficult to work, and the Jury consider it deserving of Hosourable Mentico. An abbaster chimnery-piece is rabilisted by Mr. W. Plaracci (107, pp. 604, 605), but the

material is manifestly unsuited for the purpose.

Lastly, there is a veised Carrara marble chimney-piece,

by Messrs. PORZELT and HARPERATH, of Cologne (Pruswork of the kind from North Germany. It should be remembered that this kind of house decoration is little needed in countries where close and urnamental stoves take the place of our open fire-place.

On the whole the Jury cannot highly praise the group of objects now under consideration: those of greatest pretension lack simplicity, and the rest are destitute of any originality or elegance which can entitle them to rank above ordinary furniture and house decoration.

c. Columns, Pedestals, &c.

It is unnecessary to enumerate here all the exhibitors of columns, pedestals, &c., and only a few will be men-tioned, which appear to require notice on account of material. Many of the others may have the same kind of merit of execution, which is, however, too simple to

of ment of execution, watch is, nowerer, too simple to meed description. From Tuscany are several fasts of columns, one of which, sent by C. Nouzz (91, p. 1292), is remarkable for the extreme beauty of the material. It is a breceiated markle, of a remarkable soft hrow scolour, fine texture, and good polish, and is well adapted for house deco-nition. It has been selected for Houserable Mension. Other columns from Tuscany, by GUIDOTTI (94, p. 1293,) and Marres (95, p. 1293), are not without consi beauty, but they are not so new. They are for the most part of hrecciated marbles.

part of affectioned marines.

The Belgian columns exhibited by the Viscount Des-MANT DE BISEME (Belgium, 16, p. 1151), and Honourahly Mentioned by the Jury, are chiefly interesting as examples of the hisek marble of the country. The French have

contributed few objects of this kied. Of English columns there are some of considerable interest. Two of large size and great beauty, adapted for church or palatial decoration, are sent by Mr. Champen-Nownz (Main Avenue West, 158, p. 848), from a quarry in Devonshire, capable of yielding much excellent material, in slabs of large size. The marble is of the kind called "madrepore," being almost entirely made up of coral-"madrepore," being alsoost entirely made np of coral-limestone, greatly attered, but retaining its organic tex-ture. The colour is good and richly varied, but it has the demerit of being cut the wrong way of the grain, and the demerit of being cut the wrong way of the grana, and is hailt up as stone-work although polished as markle. The Jury make Honomable Mention of these columns. The Royal. Derails Society (71, p. 788) has sent bast-pedestals, one of a white marble, and the other of a well-known green colour, both from Comensana. The latter is remarkable for its rich green has and great beauty; and the electric of material keing important in ornamental marble-work. The Jury have made Honour-able Mention of the Society for the success attained in the present collection. There are two marked varieties ine present contection. Inere are two marked varieties of colour of green Connemars marshe, one being much darker than the rest. Mr. Franklin, of Galway (73, p. 768, and Class I., 144), has sent two black marble pedestals, one prepared for polishing and another finished. These show the quality of the material, which is insquestioned to the content of the material, which is unquestioned to the content of the material. tionably good, and both are from his neighbourhood

tionany good, and not are from his neighbourhood, mesers. OldpristD and Co. (p. 969), Mesers. Lozas and Soxs (81, p. 969), and some other exhibitors from Derbyshire, have supplied specimens of Derbyshire markles of various kinds, which well illustrate the character of the stone and its uses. The localled rosewood marble, which is one of them, has been already described. It is very beautiful, but so much harder than the others, that the saw will cut the encrinital marble of the same district three times as quickly. Various pedestals of granite and porphyry are exhibited from Cornwall, but these will be elsewhere described.

d, Slabs, Table-tops, and Tables,

These objects are chiefly interesting in reference to the material of which they are constructed. Some of the marbles are beautiful, and a few are remarkable for

rar

The Connemara marble tables exhibited by Mr. Laxi-

and placed on pedestals of black Galway marble. There are flaws in the slabs, but they are Hononrably Mentioned hy the Jury as good samples of the material, which is wurthy of more extensive use than it has hitherto ob-tained. The Galway marble is also exhibited by Mr. HUNTER (Class XXVI., 202, p. 751). Mr. Champer-nowne (6, p. 764) exhibits a table of Devonshire marble, not very remarkable for beauty of material, but massive, well preportioned, and adapted for certain uses. An interesting and rather beautiful slah of the Plymouth limestone, used in the construction of the breakwater, has been formed into a table, and is sent by Mr. STUART (55, p. 767). A magnificent slah of foreign marble is amongst the goods exhibited by the London Madrie Working Company (17, p. 764), and is worthy of notice

for its excellent finish, It is pleasing to observe amongst the goods sent from Canada a table of polished limestone or marble, the material the same as serves for ordinary building purposes in that colony. It is remarkably fine-grained, but the colour is not particularly ornamental. It is exhibited by Mr. Hammond (118, p. 965), and is Houserably Men-

A table is exhibited amongst the East Indian productions, the top of which consists of a slice of a column from Nineveh. It deserves attention from the condition of the limestone, though the material takes only an imperfect polish. It is the property of Culonel Sykra (p. 921).

The slabs of marble exhibited by M. Guislain, of Belgium (423, p. 1164), are good specimens of the ordinary pregram (42.5). I (3.4) are good aperaneas or the ordinary material used extensively in that country, not only for ornamental, but for general domestic purposes. It is no doubt owing, partly, to the low cost of the labour required for preparing these slashs, and partly to the great ahundance and warriety of the material, that matebe is so much more used on the Continent than with us; hat it is wortby uf consideration whether we might not introduce the cheiper kinds for many purposes of furniture, and in so doing, follow the example of our neighbours in France, Belgium, and elsewhere. M. Guislain has been deemed worthy of Honourable Mention.

The Italian marbles used for tables and slabs are sent by several exhibitors. Of these the Count de Guido (Tuscany, 93, p. 1293) exhibits two of red colour and excellent quality. The material is little known. The Marquis Panciariccut (Tuscany, 96, p. 1293) shows a good specimen of "Immschella," or fire-marble, which is a dark-brown shell marble, having brilliant fire-reflections from within. He also has two smaller tables. M. NANNI (Tuscany, 29, p. 1293) has sent a circular table, of the marble called *verde di proto*, and M. Gunotti (Tuscany, 94, p. 1293) three tables, two round and one oblong, tho r of good colour, but not very close texture,

The ROYAL TECHNOLOGICAL INSTITUTE (p. 1290) has also forwarded a number of tables of various kinds of marble, sufficiently described in the Catalogue. some reference has already been unde in speaking of the Tuscan marhles generally.

There are but few proprietors of those numerous qu ries in Germany which furnish the various marbles in common use, who have thought it wurth while to forward for exhibition fair samples of their produce. Amongst these is, however, one, the RUEBELAND DICAL ESTABLISH-MENT OF BRUNSWICK (Prussia, 780, pp. 1093, 1094), which deserves notice for the beauty of the slabs and the good condition in which they are seut. M. CANTAN, of Berliu (Prussia, 235, p. 1061), has sent a heautiful slab of Prussian marble, very admirably executed. Of the former exhibitors, Honourable Mention is made for the group of objects they exhibit. The latter is rewarded with a Prize Medal, having sent several articles of considerable interest.

The collection of marbles cut into slabs and table-tops, and sent by M. J. J. FIGURIARDO (Portugal, 248, 249, 252 to 257, p. 1310), has been Honourably Mentioned by the Jnry. This series is exceedingly remarkable for the beauty and great variety of many of the specimens, and illustrates the riches of Portugal in this respect. Some mear (70, p. 768) consist of two picked slabs from the illustrates the reduce of Potugal in this respect, Sonte Ballinahinch quarry, considered to be remarkably fine, of the slahs, especially, must be very valuable if not too

909

hrittle for working, which cannot be positively ascertained in their present state. The specimens of M. Dejeant, of Portugal, have been referred to before, in treating of the collections of marbles from various countries.

The ECTYPTAN GOVERNING P. J. 1600; has seed a number of samples of that extreasely begunified marsh is how as "Oriental alabaster," This material is not really alshaster (suplaste of lime join the modern sense of the word, but transparency, and peculiar texture, it resembles that mineral, which has indeed been named from it. The table-tops of this stone are very beautiful, and admirably worked and polished. They have obtained Hosourable

From the United States hut few specimens of marble have been sent, hut we observe a very beautiful and wellexcented table-top of yellow marble, resembling Senna, sent by Messrs. Doe, Hazlarton, and Co., of Boston (418, p. 1462).

e. Miscellaneous objects in Marble, &c.

Miscellaneous objects in marble, alaboater, &c., are arranged to the fine of the first production of the first production of the table and drawing-room, from England and Ireland. Namerous small toys and other objects are set from India, with garden-seats; some vaces and other things from Italy, and a few trifles from other countries. We proceed to cummerate them.

The foat are several in number; some of white stary martle, one of martie from Devoushire, and others of less pretence. Two of the former, exhibited by the LOSSOM Manner. Womanton Conseave (17, p. 744), are third is by Mr. Pixwas (Nave, 9.7, p. 850). The Devoushire marble forth by Mr. Boxxrq. (7-64), in a fine specimen of the stone, which is one of the richly varingsted adapted to the object, nor is the style good, though the

excequion as markle work is praiseworthy.

Hatourt, and the jugs by Mr. Texaxia, all of black marble, are of elepant shape and perfectly well flashed. Mr. Vallance, of Madlock, whose most important objects will be spoken of amongst inflaid work, has son teveral articles of marble, among which may be mentioned five vance, some of good formst their from the antique, an and a Roman bath of the same material. These are good specimens both of material and manufactors.

A tomb in alabaster, by Mr. Cundy (Nave, 60, p. 848), being a elever illustration of what can be done in this material, is considered by the Jury as worthy of a Prize Medal.

If from the British goods of this band, we turn to those of other countries over which England bolds rule, we shall find a number of striking and boundful manafactures that the strike of the striking and boundful manafactures which may be specifically mentioner, the handsome while markle gardes-sens, understood to be a present from the markle gardes-sens, understood to be a present from the condition of objects of the same, or rarry the same material, challenged by the Razaror Jornanovou (p. 2011). These latter, manufacting in number to Sc, are perhaps expalailities of the saterial. The former challenge are presented to the same of the striken of the saterial. The former challenge has been considered vorthy of Honozanth's Revision. Beindes manufactured markle from Van Deursch Land, set of the same of the same of the striken of the same of the sam

ably Mentioned by the Jury.

From France the miscellaneous objects in marble are
hnt few, except those where marble is applied to furniture, and general purposes of decoration, combined with
wood-work. Mr. Sinon, however (1016, p. 1227), has
some marble ornaments.

solide martice transactions, occurring the whyce in martie of a miscellaneous character. There are, however, a found in a feet and the second of a miscellaneous character. There are, however, a foundate by M. Toccut, of Frankfort (5 Zelle, 21, p. 1122), and some small ornaments from the mannfactory of Diez, in the Dueby of Nassan (6 Zelle, 8, p. 1132). The model by M. Noc has been deemed worthy of Honourable Mention.

The vertices of matthe has been so long a staple manufacture of Islay, that we might well expect from that country a preponderance of such objects as illustrate the varied applications of this material to the arts, and to decorative purposes generally. To a certain extent, this is the case; int, atthough most of the productions of Italy are ornamental, they are not pre-eminent for novelty or variety. Among them, however, are some of extreme

beauty and one recoffence.
The near remarked combester, streetly belonging the first street and the street in the presence of
so greatly and justly admired. The Jury have awarded a Prize Medal to this exhibitor.

From Rome we also have a number of other works; some of them by the same artist, and in the same mate-

rial; but others by Mr, Van der Staat, exhibited by the proprietor, Signor Dtra (pp. 1287, 1288). Among them are some models of architectural constructions and antiquities in fine Sienus marble, and a bollow altar of Oriental alabaster provided with a lamp, and intended to show the remarkable translucency of this material. All these are

of excellent workmanship.

From Tuscany are exhibited several objects, constructed of the true alabaster, so shundant near Vulterra. Among these a very beautiful and large vase by Messrs. G. Chr. aici and Soxs (116, p. 1299) is Honourably Mectioned by the Jury, as well for the material as for the treatment of the subject and the mechanical execution. There is also a pair of large candelabra of brown alabaster exhi-bited by Solaini, of Leghorn.

Among the objects properly belonging to this group, may be mentioned, in conclusion, a baguivola of lapis lazuli, extremely remarkable for its large size, and for the extreme parity and richness of the colour. For these reasons it is of great value, but has little beauty of form or excellence of workmanship. It is exhibited by Mr. Jones (Rome, 48, p. 1287), and is considered worthy of Honourable Mention

F. WORKS IN ORNAMENTAL STONE, GRANITE, AND SPAR.

a. Serpentine, Granite, and Porphyry.

We bring together these materials more for convenience than for any marked similarity in the modes of working. The serpentines of England are not harder than the commoner marbles, and are worked in the same way; whereas the granites are extremely hard, and require peculiar treatment. There are not many exhibitors in these materials. To Mr. J. ORGAN, of Penzance, in Cornwall (85, p. 769),

a Prize Medal is awarded for bis fine and well-selected group of objects, manufactured in the serpentine of the Lizard. The material, employed only by Mr. Organ and one other exhibitor, is an extremely beautiful marble of moderate hardness, differing essentially in this respect from the serpentine of Italy and Greece. The colour is extremely varied, but that which is commonest and most admired is a rich dark olive green, spotted with red, and traversed with veins, often of the purest white, but some-times of dark crimson. The articles exhibited by Mr. Organ are remarkable for their large size, and the good taste they manifest, as well in the style of mannfacture as in the selection of the specimen for the kind of work. They include a pair of obelisks, a font, and a chimneye, besides vases, and other smaller ornaments

The exhibitor has the right of quarrying over an extensive district, chiefly occupied by the serpentine: the work is generally pursued in summer. About one ton in four of the rock is of fine quality; the blocks are generally small, though they have been obtained 7 feet long, and from three to five tons weight. A very long, and from three to five tons weight. A very beautiful and large specimen, partly polished, is exhi-hited outside the western end of the Building (l, p.). It may be well to state that the cost per ton is from 5l. to 10f., according to weight, and the price of slabs 1½ inch thick, and not exceeding 5 feet leng, is 6a per superficial foot from the saw, and 12a per foot moulded and polished. Mr. W. Peance, of Truro (75, p. 768), is an exhibitor of various objects mannfactured from the serpentine of

the Lizard, from steatite, also from the Lizard, and from the fine granite from Lamorna, Withiel, Luxulian, and other places in Cornwall. The whole group is of remark-able excellence, and the Jury have awarded a Prize Medal to the exhibitor.

The steatites of the Lizard differ little from the serptines in their essential components, both being silicates of magnesia; although the former contain a larger proportion of silica, and the latter much more water of consolidation. Both minerals vary, however, much in composition, when in a massive sinte, and probably pass into each other in the Lizard rock. The serpentine is much harder than steatite, and is generally more richly coloured, so that the latter, although often beautiful, is better adapted for smaller objects than the former, which,

when in large blocks, has a rich and noble effect. Many of the small articles by this exhibitor, manufactured of steatite, are well worthy of notice." Mr. Pearce also exhibits several pedestals, a large slab,

and a chimney-piece of granite, and pedestals of porphyry. The style of the chimney-piece is heavy and massive, but not unsuited to the material; and its workmanship is decidedly good. The difficulties in bringing granite and porphyry to a perfectly plane surface without the lathe, have been very successfully overcome in the case of the or table-top, which is of large dimensions, and exhibits no flaws, and no imperfections of work.

Mr. J. H. MERERITH, of Fowey (Class I., 141, p. 134),

MI. J. H. MERGERTH, OI FOWEY (CHRS I., 141, P. 104); exhibits three noble slabs of Cornish porphyry, one black, another red, and the third green; all of fine quality, and polished on both sides. The largest, which is of a fine red colour, took nearly four months to complete, the eutting being done by machinery, and the work going on night and day. It is absolutely without flaw or defect, and weight about 8 cwt. The material is so benutiful, and the work so excellent, that the Jury have no hesitation in awarding a Prize Medal to this exhibitor.

The quarries from which these fine specimens of Cornish porphyry are obtained were first worked by Mr. J. T. Treffry, of Place, who commenced the erection of a hall, in which the various specimens are exhibited, and who greatly exerted himself to introduce the use of this material for decorative internal work, and for the Fine Arts

The only exhibitors of Scotch granite in articles of an magnitude are Messrs, Macnonath and Lastate of magnitude are Messrs. Macronald and Leslie, of Aberdeen (74, p. 768), who have sent two vases, a pedestal, and a noble slab for a table-tap. The Aberdeen granite differs from the Cornish, in being for the most part finer grained, and of a peculiar flesh tint. The spe-cimens here exhibited are of the finest kind, and their wurkmanship is unrivalled. They are also in good taste, and although the material is not without flaw, this may be excused, when the large dimensions of the different objects and the rarity of perfect blocks are taken into consideration. To these exhibitors a Prize Medal is awarded.

There are one or two exhibitors of grasite mannfactured into articles of small size, and almost partaking interine into articles of small sale, and author partaking of the nature of jewellery. Soeh are Mr. G. JAHISON, of Aberdeen (Class I., 25, p. 123), Messrs. hirtira so, of Aberdeen (Class All, 25, p. 123), Messrs. hirtira sand Sons, of Aberdeen (Class X.HII., 24, p. 423), and Messrs. Ellis and Son, of Exeter (Class X.HII., 12, p. 1674), the former of whom show some elegant forms exclutured in Aberdeen granite, and the latter, knife-handles in similar material from Deronolative.

Of foreign porphyries there are few examples in the Exhibition, but amongst these we may mention a table, small column, and tazza, exhibited by Mr. Cantian, of Berfin (Prussin, 235, p. 1061), with some marbles also worthy of notice. The table is a round slab of red colour, and fine texture, and the tazza-vase and pedestal are of the same material. They are all well-finished and creditable specimens, whether as regards material or execution. They are accompanied by a small column of polished garnet rock of very singular appearance. The Jury have awarded a Prize Medal to this exhibitor,

In the Scandinavian compartment there are several objects constructed of a very hard syenitio porpbyry, found in detached boulders (erratic blocks) in various parts of Sweden, and also in situ in Norway. Of these, uan numered 43 (p. 1352) is from the Hjula quarry, in Norway, and is of a graylsh-red material, probably rare, The Jury have awarded Hosomeble Mention to the Swedish popphyry work georally, including not only this vase, but another exhibited by Mr. Wallis (47, a. 1353). that numbered 43 (p. 1352) is from the Hjula quarry, in p. 1353).†

* The articles here described are constructed of the more oranmental specimens of steatite, and are highly polished. Those previously alluded to (p. 559) are for economic purposes and are left rough. The material slightly differs also to composition.

† In the early part of the month of September, and after the awards of the Jury had been finally determined up, a

M. Colin, of Epinal, in the department of the Vosges (France, 1564, p. 1251), exhibits a collection of the marbles, granites, and serpentiaes of that part of France. Some are of considerable beauty.

A vace and group of figures in Italian scrpentine, exhibited by Mr. Noactti (Class XXX., 309, p. 840), are meutioned here simply as illustrations of the material. Two large vases of a peculiar material called agate marble, harder than alabasete, and nearly as transparent, may also be seen among the objects seut by this exhibitor.

b. Jasper, Jade, Agate, Crystal, and Spar.

The jasper and quartz rocks of Siberia, well known as materials of eatreme hardness, worked only in the Russian empire, and rarely met with except as Imperial presents to princes and distinguished foreigners, furnish a group of very remarkable objects exhibited among the Russian goods, and deserving of notice on all accounts.

The natival of some of these were in quart rook, but of prevaled close and extreme toughest and hardrook, or greated close and extreme toughest and hardrook, reclaims all contract companies to be set exist in filters, by pound the Ourta, and are in great shandanes and sprint; The was exhibited from Roman portal munificatives of Dastrichtung and Kelyana, whose of the work in performed by manual labour, the only machine such being, in fact, a very maps beind of worked by jume touch and many. G. MOSAICS OR INLAID WORK IN STONE.

The art of mosaic (eyes musicum of the Romans), originally applied only to the combination of small diceshaped stones (tessers) in patterns, has very long been an important source of labor to the inhabitants of several parts of Italy, and under various modifications is own carried on in the principal cities of Karope. The tions of revery, and he now understood to include all kinds of linkid and vancered work, in whatever material, CLASS XXVII.1

We have here to consider those specimens in which marble and gems are the materials principally made use of; the Roman mosaics manufactured in glass being

referred to a different group." With this limitation there are still several kinds which we may conveniently treat of separately. They are,-Florentine mosaie, or work in gems (pietre dure).
 Derbyshire mosaic, imitative of Florentine, but in

3. Russian mosaic, or inlaid work in malachite.

a. Islaid work in Pietra Dura

This manufacture consists of certain kinds of hard stone inlaid in a slab of marble. They are, for the most stone inlaid in a stab of marble. They are, nor the most part, those pseudo-gems, generally varieties of quartz, known under the names of agate, jasper, chaleedony, cornelian, &e.: but stones such as lapis lazuli, remarkable for their brilliancy and depth of colour, are also included, and come under the general denomination of pietre dure, In this kind of work, a slab of marble (generally black) of the required dimensions, and about an eighth, or threesixteenths, of an inch thick, is prepared, and the patterns to be iniaid are carefully ent ont with the saw and file. The hard stones, worked into the required pattern by the ordinary methods of gem-entting, are accurately fitted into the spaces thus prepared, in a polished and finished

state; for, if the whole were to be polished at once, some of the substances, being softer than others, would be worn away too rapidly, and the picture, instead of presenting a smooth surface, would be unequally polished, and the outlines would be granulated or chipped. The work, also, is liable to be spoiled by the accidental placing of one stone lower than another, and mistakes of this kind will often lead to the ruin of the whole, surface is thus prepared it is veneered on a thicker slab, and is then fit for use. In point of difficulty of execution, durability, and taste, this process of inlaying in hard stones, or gems, may rank as the most important purely decorative work within the whole range of mineral manu-

In order to illustrate the peculiar mode of inserting the different pieces of agate, jasper, &c., in these beau-tiful works of art, and to show also to those not familiar with them the elegant and simple forms produced, it has been thought desirable to prepare a diagram showing a fac-simile of a portion of the inlaid work in one of the tables exhibited. In this diagram the hard line re-presents the outline of the flowers, leaves, &c., and the dotted part the lines where the different pieces forming a dotted part the lines where the different pieces forming a single object are joined together. The extreme delicacy and accuracy of the joints can only be fully appreciated by the examination of the original specimens.

Pac-simile of inlaid week in Florentine messic.

The principal exhibitors of true Florentine mosaic in pietra dura are the Brothers BUONINSEGNI (Tuscany, 118, peers durk are the invineers rECONENCENT (INCADY, 115, 1299), 60 HANCHIMI (TUSCARY, 119, D. 1299), and the IMPERIAL MANUACTORY of PETERROPY (Russia, 298, p. 1376). The two former exhibit good examples of the best manufactures of this kind. Most of the designs are in good taste, and all are admirably executed, but they do not present any great amount of originality. The Russian table is from a manufactory established for some time at St. Petersburg, originally worked by Italians, but now solely hy Russians. The workmanship is in the highest degree ereditable; but there is nothing original, either in execution, or in the arrangement of the different ornaments. Many of the jaspers and other stones are of great beanty, and are obtained from Siberia. Most of the stones used in the Italian tables are pehhles from the Arno. Prize Medals have been awarded to all these exhibitors, but the latter establishment is especially rewarded for the relief work about to be described, A very remarkable, and extremely beautiful variety of

* See p. 577.

pietra dura work is exhibited in Resisia (298, p. 137). I consists of a jewe-lease, materized to be the preperty of the Empress of Russia, constructed of word, and having the Four sides and top covered with groups of fruit est in pietra dura, in a style which may be called comes-seed; a reader high relief. The stores are so elected as to arrive the relief. The stores are so elected as to make the relief. The stores are so for elected as to make the relief. The stores are so for elected as in internal structure, of the fruit they represent (currants. pears, plass, &c.), and the whole work is exquisitely finished. To the exhibitor of this, the Jury have also awarded a Prize Medal. They think it right, however, to add that, whilst fully admitting the extreme beauty of the general effect, and of the particular stones selected, they do not regard this style of mosnic as ranking so high as the inlaying of tables, inasmuch as the separate pieces are here cut and shaped independently of each other, and comented on the surface they are to decorate, without having to be fitted to adjacent pieces before imbedding. There is, also, little danger of failure, even the dimensions do not strictly correspond. The goods recently added from the Royal Porphyry

Works of Dalecarlia, and already referred to, include

an inlaid oblong table of granite, porphyry, and jasper, which descrees notice in this place, as well for beauty of workmanship as for design. The pattern is geometric, but very regular and elegant, and in very good taste. The materials are hard stones of the country, mul the mechanical execution admirable; but being paparently of equal hardness, they admit of being polished after the whole is completed. It is exhibited by the Kixu or

Swams (31, p. 1355).

Checky allied to the Fineration work, but of even Checky allied to the Fineration work, but of even Checky allied to the Fineration work, but of even call of management, is at holian chess-table (p. 21) with a middle looker; and a masker of main looker than from the control of the co

b. Islaid Work in Marble.

The great expense of inlaying hard publics, which can only be cut a goan, and the excellent effect that may be only be cut as goan, and the excellent effect that may shall, cement, and glass, replace the jusper and agate of Plorentine mouse, have caused the introduction to Daghad and clue-bere of a manufacture which may in the contract of the contract of the contract of the great variety from Derhyshire, where this manufacture has become very important; from Devonabine, where conceiling of the kind has been for some time known conceiling of the kind has been for some time known.

something of the kind has been for some time known. There are two principal methods of profusing matched modal; that followed in Dettyshire, where a recess is ground; and that parmed in Devotadire, where a various column and forms being merely constited on a various column and forms being metry constited on a the whole surface being afterwards polished together. The Malteres prefusions appear to before to the forms kind; within the work of the profusion appear to before to the forms kind; within the history. At first we confine control to the Parke history and the state? At first we confine control to the Parke history.

shire work, which is truly infaid.

To a very limited extent, and by a very rude method, the art of inlaying in marble was practised in Derly-shire many years ago; but within the last quater of a century it has made great and rapid advance, and shout on years since, the introduction of Florentine patterns, imitated in various ecoloured marbles, has exerted a very important infance on the trade.

The first manufacture of mousic in Derhyshire consisted of coloured spars and unables, of irregular shapes, inhedded jin cenuent, and afterwards rubbed down and polibed; these were called "serap tables," and were polibed; these were called "serap tables," and were call into definite forms arranged in patterns; but these also were rudely finished, as the workmen were not skilled in the arr of making scenaris joints, and the forms that the process was tiltle move than scenering, and the results were rather institute of brecisted unables than intended to prohine priorial effect. See that the pro-

The present Duke of Devenships, by permitting his almost left of the Collection of Piceratiae work to sever as a goids of considerable merit; an Mr. Loussa (10, p. 76), who model to the Derbyshire mannetetures, and even lending sent as a chimny-piece of hisk marths, inhald in mosaic results of the contract of the con

an imitation of a higher kind. The true art of inhying was thus brought into successful operation, and materials foreign to the vicinity, as malachites from Russis, continental marbles, aventurine, and other glasses from Venice, with some eements, have been introduced. The use of these substances greatly diminishes the cost of

the work. The condition of the trade at present may be jodged of from the articles in the Exhibition, which show much tastes and skill, though but little originality. The manntastes and skill, though the sittle originality. The mannth of the state of the skill of the state of the Baxton, Castleton, and Derby, and the number of perrons employed as monaic workers exceeds fifty. There appears to be a fair demand, and the prices, although sometimes high in London, are by no means extravagnat

as the place of manufacture.

Of the exhibits room Derhyshire, Mr. Vallance (si, p. 77) may be mentioned in faving sout two congression, p. 770 may be mentioned in faving sout two congressions are supported by the property of shell, glass, and modified mention. The property of shell, glass, and modified mention, the property of shell, glass, and modified mention. If no Mr. Vallance, are the property of the prop

in a very high degree interesting and instructive. A large round inside table, four fort in diameter, partly composed of the productions of Derbyshire, in exhibited recommend of the production of Derbyshire, in exhibited production of the product

Mr. Woodburr, of Bakewell (Class XXX., 350, p. 842), exhibits two oblong inlaid tables, in cinque-cento style, designed by L. Gruner, Esq., and very well executed. The designs are particularly good and praiseworthy, and the Jury have noticed with much satisfaction that in this case effective aid has been afforded by an artist in clevating the mosaic manufacture of the district beyond the mere repetition of Italian patterns. It may be well to suggest here to the Derbyshire manufacturers, how much more ereditable and ultimately successful it would be to place their work on a higher footing than it can be said to occupy at present, which might be done if the designa for their soft marble work were made with some referenee to their material, which differs so much in hardness from the true pietra dara of Italy, and certainly admits of original treatment. In this view, and to mark their full appreciation of the originality of the design, as well as of the excellence of the workmanship, the Jury have awarded a Prize Medal to this exhibitor. In addition to these two tables, Mr. Woodstry also exhibits (77 769) a black marble chess-table with a pretty inlaid border, equally ereditable for taste and executi two vases, one of black marble, and one of changed fluor, already alluded to.

The other exhibitors of Derbyshire inhid-owek are Mr. J. Tonta-rosson (7, p., 76), who has several specimens, chiefly lables; Mr. S. Battont (80, p. 76), already mens, chiefly lables; Mr. S. Battont (80, p. 76), already lables; Mr. S. Battont (80, p. 76), already lables; Mr. S. Battont (80, p. 76), who exhibit together a number of articles of Derbyshire work, and songing her east various inhidi takes, and smaller objects among the rest various inhidi takes, and smaller objects sends a chimmey-piece of black martle, inhaid in mossie, in a pattent to a certain extant original, though adopted in a pattern to a certain extant original, though adopted

introduce good designs in Derbysbire mosaic into house decoration, is referred to with satisfaction by the Jury; and they consider not only the idea, but, in a great measure, the design and execution of the work as worthy of the Prize Medal. The inlaid work is well done, though the introduction of Sienna marble in the capital of the columns supporting the mantel-shelf is injurious to

the general effect. We pass on to the marble mosaics of other parts of England. Of these, by far the best, in every respect, are sent from Devonshire, where the manufacture seems to be greatly advancing. To Mr. Woodler, of Torquay (39, p. 766), a Prize Medal has been adjudged for one ablong, and two round tables, the latter of very great merit, and also of considerable interest as illustrating the marbles of the district. The Devonshire work is, as has been already said, rather a veneering than inlaving process; but the result is so similar in appearance to that cess that the result is so similar in appearance to that obtained in Derbyshire that they can hardly be dis-connected. Mr. Woodley's large round table is of the kind called specimen tables, and the forms are geometric, but the execution is excellent, and the selection of marbles admirable. There is not in any of the tables by

marbles admirable. There is not in any of the tables by this exhibitor any stempt at originality of esign. The chlong table contains a fine specimen of red marble. Mesers. Hotzan m and Sosw (Class XXVI, 161, p. 743) exhibit a cabinet made for Her Majesty. This includes a certain amount of inlaid work in British marbles, well designed and well executed. The Jury marbles, well designed and well executed. The Jury consider the mosaic work in this cabinet deserving of Honourable Meution, (Prize Medal awarded by Class

Mr. Bover, of Plymouth, is also Honourably Men-tioned as an exhibitor of inlaid Devonshire marble, in a chimney-piece exhibited by bim (4, p. 764). The design of the work and the general effect are not particularly good, but the inlaving is well done, and the selection of

material praiseworthy.

Mr. Hunner (9, p. 764) exhibits an octagon inlaid

table, containing a mixture of British and foreign marbles. The design is geometric, and the execution tolerable. Mr. Moon, of Godalming, in Surrey (56, p. 767), has an octagonal table, inlaid with several kinds of marble, and tolerably well executed; and another is sent by Mr. W. Peanson, of Harrowgate (65, p. 768), interesting as W. Pranson, of Harrowgate (63, p. 768), interesting as being chiefly composed of specimens from the neighbour-hood of Knaresborough. Something of the same kind is shown by Mr, Patov (80, p. 767). It is satisfactory to find this branch of industry, which involves a consider-alen amount of skill, and admints of the display and enti-vation of much taste, extending itself throughout the British Islands, wherever material exists for its execution. In Ireland, also, the taste for such decoration is tion. In Freiand, also, the taste for such decoration is cultivated, and the Jury have pleasure in mentioning the tables sent by Mr. M. Honan, of Dublin (58, p. 767), which show much skill in manufacture, although they admit of improvement in design. Lastly, a mosaic chess-table is exhibited by Messra. QUILIJAM and CREEN (p.136), manufactured in the Isle of Man, of Manx material. Inlaid work has been executed for some time in Malta,

on a considerable scale, and on a plan imitative of that pursued in Tascany. Several tables have been sent for exhibition, and the Jury bave awarded a Prize Medal to Messrs, J. Darmanin and Soss, of Valetta (Malta, 28, p. 945), as an acknowledgment due to them for the design and execution of the specimens they exhibit. In these a black marble back-ground is introduced for the inlaying, which generally shows much accuracy of work with n very skilful use of material to produce the desired effect.

The designs introduced into the Maltese tables are, to a certain extent, original. The variety is also considerable, but there is generally a largeness in the details, which rather injures the effect, in other respects very

The polished inlaid work in stone sent from France is connected so closely with articles of furniture, and offers so little specially belonging to the present Class, that the Jury have not thought it necessary to report specially npon each specimen. They notice, bowever, a table,

by Mr. J. P. Bosst, of Paris (France, 773, p. 1217), having an elegant seroll pattern of inlaid amongst which are some stones of harder material. design and execution of this table are good; and the selection of material is worthy of notice. A Prize Medal is awarded to the exhibitor. There is also another Medal nwarded to Mr. Theret (France, 1493, p. 1248), for sundry articles of farniture, decoration, &c., showing

some originality and much excellence of workmanship.

Few inlaid works of any kind, in which marble introduced, are exhibited from the States of the Zoll-One set of tables and slabs, &c., are, bowever, sent by Mr. DEVISSE (1 Zollv., 837, p. 1095) in which an artificial breccia is introduced with various kinds of marble, The style is that which we have already referred to as belonging to the earlier period of manufacture.

In addition to the exhibitors already mentioned, the name of Mr. Gröger, of Vienna (Austria, 631, p. 1039), may be added, as having sent a eloset of ebony with mosaic ornaments, and some other inlaid work, tolerably

From Lisbon a somewhat interesting specimen of mosnic is sent by Mr. C. BONNET (Portugal, 25s, p. 1310), composed of sixty specimens, and various ornamental stones, all of the province of Alentejo. This table was produced in the manufactory of M. Dejcant, a large exhibitor of Portuguese marbles.

From the Cape of Good Hope a peculiar kind of inlaid work in marble is sent, which, though hardly very ornamental, is not the less interesting, as illustrating the industry of that colony (58, p. 952). Another specimen of somewhat different kind, in a geometric pattern, exhibited from Tunis (p. 1413), illustrates a similar manufacture carried on in the northern extremity of the same continent,

c. Islaid work in Malachite.

Malachite is a peculiar mamillated or stalagmitie form of the green carbonate of copper, chiefly found in an of the green carbonate of copper, chiefly found in an available state for inlaid work in a very few localities in Siberia, and lately in Sonth Australia. It has been long employed in Russia in this manufacture. The mineral is remarkable for its fine emerald green colour (often presenting several distinct shades in the same specimen) brilliant and silky lustre, und compact texture. It is softer than marble, very much heavier, and by no means so easily worked, owing to its brittleness and the conseentrie arrangement it generally presents. It can rarely be found in masses weighing more than ten to twenty pounds, and good specimens have a very high value, as the finer kinds are used exclusively for decorative pur-

The most important locality at present known for the finer kinds of Siberian malnehite is in the copper ground of Nilny Tagilsk, in the government of Eksterinburg, situated on the River Tura, a tributary of the Irtish, on the Siberian side of the Ural Mountains, in Intitude 57½° N., longitude 56° E. In a mine at this place, belonging to MM. Demidoff, Sir Roderick Marchison has described an enormous mass of malachite, which, at the time of his visit, now several years since, bad been recently discovered at the depth of 280 feet, strings of green copper conducting to it; and these strings, increasing in width and value, were found to terminate in a vast irregular botryoidal mass, estimated to contain not less than balf a million of poands of this valuable mineral.*

. "The geological interest attached to this mass lies in the indication it affords, that the substance called malachite has been formed by a cupriferous solution which has successively deposited lis residue in the stalagamite form.

'Mutatis mutandis,' this mess has only to be viewed as formed of calcarcous spar, and it presents every one of the features so well known to those who have examined stalagaming. features so well known to those who have examined state-titing grotos with their statagaintic floors in the elefts and eaverss of limestone, nr still more those large masses of taff which have proceeded from enlargeous wells. Wher-ever a portion of the malachite has been broken off, the interior is seen to coulst of a number of fine laminar (a fasticialia, af radio-concentric globales), which invariably arrange themselves equably around the centre on which

Fac-simile of a portion of venered malachite. The joints are marked by fine dotted lines, and the darker portions represent the artificial malachite invocts or convent. The dark lines represent the natural concentric markings of the mineral.

tables are, perhaps, the most important as being decidedly superior to tables constructed of any other material. Superior to tables constructed of any other material, the period of the superior tables of the period of the period for the period of the period of the period of the period to become rickety, slate legs and frames have also now been introduced by the exhibitor, which being dovetabled together, the use of iron is avoided, and the tables are steady and durable.

To this exhibitor the Jury have had no hesitation in awarding a Prize Medal, in acknowledgment of his admirable and useful contrivances and applications.

Mr. T. Svernanse, Jon. (Club 1, 276, 3, 181), who exhibits a large offsetion of unphelled a latest already fully described (see page 55%), and who has been adjudged a Prize Medal for these objects, has included within his group several specimens of enamelled slate highly descrively, but not perpared in the method adjudyed by Mr. Magnas. Mr. J. Childred inside strikes, consisting of tallets, linkstands, &c. These are handones, and some of them show arisist merit, but they cannot be compored with the results obtained by Mr. Magnas.

with the results obtained by Mr. Magnus.
There are several exhibitors of imitation marhles on slate and stone. Mr. Baadlar (35, p. 766) has a small state sable, carefully painted in imitation of Devenshire marble. Mr. Hall (42, p. 766) illustrates the method of writing on slate. Mr. Tuoasntill (48, p. 767) shows a rair of tables also imitative of marble.

DIVISION II.—MINERAL MANUFACTURES IN PLASTIC MATERIAL AND ARTIFICIAL COMPOUNDS.

Under this head it is meant to include manufactures in centrent and artificial stone, engilola work, and glass nossie; manufactures in all varieties of elay, including bricks and tiles, fire-clay goods, stoneware, and term cotta; and manufactures which have been referred to this close but are of a miscellaneous character, failing more naturally under this than any of the other divisions.

It may be necessary to state, as a more complete definition of the groups seggeted, that all materisks in which distinct chemical action takes place before they assume the form in which they become marketish, zer regarded as remore, while those, are regarded as copy. The common eccuents and placters, ond various articles of manufactored glass, &c., considered to belong to this class, as floram mosaics, thus belong to the former group, while term corts, salt-glased wave, fire-they goods, &c., are forted class, seed of the contraction of the conference of the contraction of the conference of the contraction o

Groop 3.—MANUFACTURES IN CEHENT AND ARTIFICIAL STONE, &c.

The number of exhibitors in these moterials is not very large, nor ore the objects exhibited numerous or from many emittries, but they are by no means unimportant, more than the contract of
of oll kinds, and many other like objects.

Of twenty-one English exhibition in this group almost all have lifestrated the decerative as well as the more than the control of the former kind. In flay, which comes next is order, is much more remarkable for the heast y of the numelicates, the list including no low thas serve a childitors in parts of Germany, including Austria, there are about eight exhibitors, whilely of the less decentarity kinds, and from France there are also itself of the less decentable. Belgium on the control of the cont

I, MASSIVE AND INCAUSTED CEMENTS

Under this head will be included common mortar and other simple lime eveneuts, Parker's, Portland, Medina, and other bydramlic cements, various artificial stones (nother terra cotta), and seggliols work of the usfeak skind, as well-disan new modifications of this manufacture. It may be expedient to explain very briefly the basis of the various cements here enumerated, and the chemical principles involved.

When common limestone of any kind, unmixed with other mineral substances, is exposed to considerable heat, it changes its appearances and character, swelling out, and passing into a white powdery material, greedily absorhing water with the evolution of much heat, and known under the name of quick-time. If a paste is made with this lime and water, and the mass be exposed to the air, the result is a loose and friable hydrate of lime; hot if a thin bed of such paste is interposed between two porous stones or bricks, the water is absorbed into these substances, and the thin bed of hydrate of lime that remains takes the consistence of stone, and adheres strongly to the two surfaces with which it is in contact. This is assisted by mixing the paste with sand and gravel, to the extent of two or three times its own weight, since the adhesion is greater to the foreign substances than to the particles of the hydrate of lime itself. Such a mixture is the common morter, used by masons and bricklayers, and as it only hardens after exposure for some time in dry air, it is not surprising that in damp places it sets with great difficulty, and in water has no tembercy to conso-lidate at all. When it is required to fasten stones and bricks together in most places or under water, another substance is needed, and this is called kydraulic line, or kydraulic cement,

There are, however, many kieds of hydraulic lime. The simplest is obtained when about 10 or 19 per cent, of clay (silicate of alomina) is combined with the original lime-tione, and when the calcination is not carried too for 10 this case the resulting lime solidifies under water, the hydrate of lime combining with the silicates of solitonian and lime, and producing a new substance, unstanted and lime, and producing a new substance, unstanted to the combination of t

E

A most important hydraulic cement, called Portload creaset, is male from enthouse of lime, mixed in definite proportions with the argillaceous deposit of some rivers running over clay and chalk, ponoded together under water, and afterwards dried and burnt. The strength of this combination is very remarkoble, being nearly four

marble

times as great as that of any natural kind, Portland cement makes an admirable and most powerful concrete, the proportion of cement required being only a tenth or

twelfth part." It is not difficult to procure artificially mixtures of limestone and clay, which are less costly than the natural

kinds, though not equal in value, On the Continent similar material is obtained in various localities, of which we may mention Boulogne, Vassy, Poully in Bargundy, and some parts of Russia. In some cases these eemeuts appear to owe their hydraulic qua-lities to the presence of silicate of lime and silica rather

than clay. Certain substances also exist in natore, and can be imitated by art which, on being mixed with common

imitated by art which, on being mixed with common qoick-lime, form hydraulic mortar. These are called puzzwolana, and consist generally of volcause ash, of which a vast quantity is found in the modern volcanic districts of South Italy, Greece, &c., and in the extinct volcanic districts of the Rhine, Anvergue, &c., hat similar salestances are found in our own country. Mortar made with puzzuolana has extraordinary hardness and dura bility, this substance having a great uffinity for lime and hydrate of lime, and forming a perfectly insoluble com-The cements hitherto described are composed essen-

tially of carbonate of lime, from which both the carbonic acid and water are driven off hy hurning in a kiln. An-other group, however, exists which we may call *plasters*, of which the base is sulphate of lime, or gypsum, usually found in combination with nearly 24 per cent, of water, and often containing carbonate of lime and clay in small proportions. On being burnt at a low temperature this proportions. On being owint at a row temperature manneral simply parts with its water, which it absorbs again readily, and with great rapidity, on subsequent exposure; but if a greater heat is applied it melts, and when cooled assumes a new and permanent form, oot altered by

The property possessed by gypsum, of parting readily with its water of solidification, and re-absorbing it as readily, is the basis of a vast variety of uses to which this mineral is applied. When mixed with water mecha-nically, after being caleined, a part of the water enters into combination with the powder, and forms a true hydrons sulphate of lime, which collects into minute crystals, fitting into each other, and the mass becomes rapidly solid, although not very hard. If the solidification takes place in a mould, the most minute cavities are found to have been filled, and the result is a perfect cast, found to have been filled, and the result is a perfect cast, owing to the expansion that thicks place while solidifica-tion goes on. Thus the calcined gypsom, mixed with water, becomes so andmirable material for casting, and is greatly used for this purpose. Vast quantities of gypsom, of various degrees of purity, are found in the immediate vieinity of Paris, and thus the powder obtained after humaning to generally designated Plaster of Poris. It is employed very extensively in constructions for various kinds of internal work. Stacco is a combination of the same substance, with a solution of gelatine or strong glue. This mixture dries more slowly than that made with water, hot is more durable,

Sulphate of lime is the basis of all the cements known as Keese's, Martin's, Parian, and some others, but in these the plaster in the state of fine powder is thrown into a vessel containing a saturated solution of alom, sulphate of potash, or borax. After soaking for some hours it is removed and air-dried, and subsequently rebaked at a brownish red heat. When taken out of the oven it is once more reduced to a fine powder, and carefully sifted, after which it is fit for use, but when slacked a solution of alum is employed instead of pure water. When borax is used, the plaster is called Parian, but in the other case it forms Keene's cement. The kind called Martio's cement is made with pearlash as well as alum, and is baked at a much higher heat than the rest.

The raw material for these various cements, of which the consumption is now extremely great, is obtained from

* See an account of experiments on the strength of Portland cement, p. 587.

Derbyshire, Nottinghamshire, and Cumberland, besides the neighbourhood of Paris. The quality differs much, but for the finer kinds of cement the most crystalline is

considered the best. Vast quantities of gypsum exist in Tuscany, much of it in the crystallice form called alu-baster. The English gypsum is sometimes in beds of very varante thickoess, isometimes in leuticular masses, and occasionally in veins. It occurs extensively in the new red sandstone, but also in the clay deposits of the new red sandstone, but also in the clay deposits of the platter, containing generally a little lime, but the pure platter, containing generally a little lime, but the pure thirds are much whiter when burnt. In France the grpoum is hurst in oppen kilns, and is thos discoloured, but in England this is avoided the final and Line 18. very variable thickoess, sometimes in leuticular nusses,

ot in England this is avoided, the fuel not being allowed to come in contact with the plaster. A highly ornamental material, consisting of a coating of plaster mixed with aluot and colour into n paste, and afterwards beaten on a prepared surface with fragments of marble, &c., has long been known under the name of scagliola, and is greatly used as an excellent and economical means of ionitating the finer kinds of marble, the material being as hard as marble, very durable, cold to the touch, and taking a perfect polish. The name scarthe touch, and taking a perfect polish. field is derived from the Italian, where the process is said to have been invented more than two centuries ago, but it is now very extensively used for decorative purposes in England. The cement is prepared from the finest gypsum, broken up before calcining, and afterwards redoced to n fine powder and passed through a sieve. It is then mixed with aluminous matter, and isingless, and also with colouring matter, and is afterwards made up with alum; and as it is generally made use of only where the more beautiful and veined marbles are to be imitated, as many different colours and shades of colour must be mixed up separately as there are in the kind of marble to be represented. Thus prepared, it is ready to be laid on to the surface intended to receive it, which has a rough coating

of lime and hair already prepared.

The different colours having to be laid on and mixed by the hand, the work somewhat resembles that of the fresco painter, everything depending on the skill of the operator in imitating the style, beauty, and veining of the original. When the rement is laid on and has hardened. original. Were the cement is laid on and has hardened, the surface is prepared for polishing hy rubbing it with pumice-stone, and eleansing with a wet sponge. It is then polished by rubbing, first with tripol and charconi, then with felt dipped in tripol and old, and lastly with oil asone. A durable laster is thus obtained, equal to that of

With this general outline of the nature and use of the various cements and plasters in which carbonate and solphate of lime are the essential ingredients, we pass on now to the different exhibitors in these materials. There are several in each, chiefly from our own conotry and Italy, so far as larger and more ornamental specimens are con eerned. They show some novelty and much excellent work, and form a very interesting and important group of objects. We commence with those who chiefly exhibit the cements properly so called, and the larger groups of objects, as applied rather to construction than decoration, and shall afterwards proceed to the plasters and scagliolas.

a. Hydraulic Cements. Messrs. Roning, Asppin, and Co. (Ontside, West, 5,

and Class XXVII., 103, p. 772) are exhibitors of a gigantic slab of Portland cement, measuring 20 feet by 12, and 10 inches thick, weighing 15 tons; numerous blocks of cement and concrete, proved to various pressures, up to 154 tons, showing the strength to be greater than that of Portland stone; of brieks cemented together and placed so as to give a pressure of 3 toos on the first brick; and of several other similar illustrations.

to severa other similar ministrations. It has already been said that Portland cement is a hydraulic mortar, made of a mixture of chalk and a peculiar river silt. In working it is sometimes mixed with said and even with broken brick, forming a kind of concrete of extraordinary strength. It receives its name from its peculiar colonr, which approaches that of Portland stone, and not from being made from that stone,

or in any way obtained from the Isle of Portland. Its hardness is very great, and it may be used with advantage, navances is very great, and it may be used with abstration, not only as a centent, but in many cases where ordinary stone is generally employed, and is even available for tanks and cisterns, being, when carefully manufactured, absolutely non-absorbent of water. The Jury have warded a Prize Medal to these Exhibitors, as showing specimens on a very large scale, admirably illustrating the use, the strength, and other capabilities of the material they manufacture. In addition to the illustrations afforded by specimens sent for exhibition, Messrs. Romas and Asppin, as well as other Exhibitors (Messrs, J. WHITE and Co.), have tested the strength of their cements of different kinds, in the presence of some members of the Jury, and the results of these experiments will be included in an Appendix to this part of the Report.* They will be found to contain facts and results of great scientific interest and practical importance. These Exhibitors illustrate the use and comparative strength of several ad-mixtures, consisting of different proportions of Portland cement with sand, broken brick, and other fragmentary substances, and the experiments sufficiently demonstrated the great strength of these valuable cements, and the

different modifications of them. Mr. J. Segley (Nave, West, 88, p. 852, and Outside, West, 1t, p. 114) is the exhibitor of a large fountain, iutended for a market-place, occupying a prominent position in the West Nave, and also of a figure of Mercury in the West Enclosure outside the Building. Both of these are of artificial stone, and although the former does not exhihit the material under very favourable elecumstances, the Jury are satisfied that the general reputation of Mr. Seeley, and the uniform excellence of the material he manufactures, deserve to be rewarded with a Prize Medal. It may be well to refer here to a grent want manifest in this fountain, and in many other objects manufactured of artificial stone both by the present and other Exhibitors: we mean the necessity of some adaptation, not merely to the purpose required, but also to the material to be employed, a necessity too often lost sight of by

those who provide and execute designs.

Mesens, R. and W. Teaole (Outside, West, 3, p. 113) have sent a figure in Portland coment, exhibiting some merit in execution, and modelled from a figure of Lazarus in wood. It must be remarked, however, that there is n want of taste and consideration in thus copying in an imitation of stone, what was carved in and adapted for wood. The treatment and feeling of true works of

nrt must and ought to take their tone from the material

Mr. J. Boann, Bridgewater (by his agent Mr. Donohue), is the exhibitor of four figures in Portland cement, two of them outside the Building in the Western Enclosure (2, p. 113), and the others in Class XXVII. (94, p. 771). se figures belong to a numerous class intended for garden decoration, and are not unpleasing in themselves, aithough the colour and appearance of the material are not very satisfactory. We also have Mr. F. Greaves (Class I., 99, p. 131) exhibiting several figures and other objects in cement which offer little for observation.

cimens of an artificial stone invented by him, and mannfactured since 1838, adapted for flooring damp places and other purposes. This material is of rather dark colour and considerable hardness; it may be cast in slabs of considerable size (up to 8 feet by 5), and is applicable for sucrision and drains, both pipe-drains and inverts for sewers of large dimensions. It has also been used for fortification-works, as a cement for bricks, for lining prisons, casements, &c., and for many minor uses. It is non-absorbent, and is said to stand exposure well. The price of this material in slabs is 6d, per square foot, up to 2 feet square, and for other works it is cheap in proportion. It was first invented in Hamburg, and is said by the manufacturer to be used on the Continent in many extensive works for drainage and fortification. The Jury have adjudged this manufacture to be worthy of Honourable Mention.

Other exhibitors of cements, more or less completely manufactured, but not strictly decorative, and not includ-ing coloured or acagliola work, are Mr. T. SMITH (Class 1, 177, p. 139), who shows two blocks of concrete manu-factured of the Mountfield lime, Sussex, a manerial very well factured of the MORIBHER LIBERT COMPANY, CONTROL AND ASSESSED OF THE PROPERTY AND ASSESSED OF THE PROPERTY AND ASSESSED OF THE CONTROL OF THE PROPERTY AND ASSESSED OF THE PROPERTY ASSESSED. cation to building purposes for agricultural cottages. We may mention here, also, some blocks of Medina cement exhibited by Messrs. Francis and Son, who, having ob-tained a Medal for their Parian, will be more fully referred to when the scagliolas are described.

referred to when the sengitolas are described, M. Acountary (France, 2, p. 1169) has received Hononr-able Mention from the Jury for the hydraulic essents which he exhibits, and of which he is the manufacturer. The hydraulic ansture of the cement exhibited by M. Agombart is derived from the kind of puzzoolasa which he uses, rather than from any natural qualities the stone possesses; but the Jury having the opportunity of seeing and comparing the various cements exhibited, find that this is somewhat light and porous. They understand that it is made of a limestone containing a certain propor-

tion of silica.

Messrs. REONT and Co. (France, 1427, p. 1244) have obtained Honourable Mention for an hydraulic lime by a mixture of burnt and unhurnt stone, so that the result is another modification of puzzuolana. The method is ingenious, and the result is said to be satisfactory, but the Jury regret that in this and several other eases before them, it is quite impossible to come to any definite con-clusion, as the test of experience is the only one that is of any value, and they have no means of judging beyond the more examination of a material exposed to no test, and exhibited on a very small scale. This remark applies to the objects exhibited by M. DR ROOLZ (France, 1466, p. 1246), which consist of a number of bottles filled with cement, and M. HKILIGENTHAL (France, 259, p. 1189), who shows some very neatly fluished objects in a hard mastic, beautifully and delicately constructed and adapted for architectural decoration. M. Evaor is another French Exhibitor (190, p. 1183), concerning whose performance the Jury have no remark to offer. Both these Exhibitors are Honourshly Mentioned.

From Belgium there are two Exhibitors in cement.

Mr. C. SOLTENS (424, p. 1164), and Mr. N. FOLLET (426, p. 1164). Neither of them admit of any detailed notice. p. 1164). Neither of them admit of any detailed notice. From Central and Southern Europe there are a few eements, the most interesting of which is sent by A. CRISTOPLE (Austria, 38, p. 1008), who is Honourably Mentioned for a collection of paving blocks and columns of some interest. Measur. J. Stanka and Co. (Sardian). 88, p. 1305) also exhibit paving blocks of artificial marble, so, p. 1.305 lates extinct paving necked ratificial markle, and have received the same notice. Both these Exhibitors appear to be manufacturers of a material well daspeted for the purposes for while it is intended, and no doubt of sufficiently moderate price when laid down in the country. The prices quoted to the Jury are not sufficiently directed from those charged for similar results in England to require special regarks on this score. Mr. Fusse (Outside, West, 19, pp. 114, 115) has sent spe-The GREEK GOVERNMENT are exhibitors of a very fine

of Ulm (Wurtemburg, 5, p. 1114), which is described as a quickly-setting, hard, and valuable material, the price being 1s. 8d. English per cwt.

From Austria we have two Exhibitors of artificial mice-stone, Messrs. B. Hardmutt and Co. (35, p.1008), and Mr. J. Schanas (36, p. 1008), and one who sends nrtificial stone and marble, Mr. R. ROHLIK (37, p. 1008). The artificial pumice is not without importance in the absence of an ahundant and cheap supply of the natural

stone, and is understood to be extensively used. b. Plasters and Scaoliola.

The general composition of the plasters has been already explained, but as the subject is one of importance and very general interest, we may here briefly recapitu-late the more essential features of distinction between them and cements. The latter (cements), whether hy-draulic or otherwise, easily part with the carbonic acid and water which the cement-stone contains by the mere application of heat, and become reduced to lime, whence, by certain treatment and some admixture, either natural or artificial, but generally by a mixture of silicate of alpmina, a material results which more or less rapidly takes up the water required for effecting solidification, and immediately hardens without being affected by external eircumstances. The basis of such cement is earbonate of lime. On the other hand, the plasters are carrocate of mo. On the other hand, the phasers are composed of a basis of sulphate of line or gypsum, which being hurnt, parts only with its water of solidification without being in any way decomposed. The re-admix-ture of water reproduces solidification, though in a somewhat nitered form, but hy adding some of the salts of alumina, borax, and potash in a certain stage of the process, it is found possible to increase the hardness and compactness of the newly-formed stone and modify very greatly its absorbing power. In these admixtures lies the secret and peculiarity of all the various patented plasters known as Parian, Keene's, Martin's, and others. Messrs. J. B. WHITE and Soxs (Class I., 130, and Out-

patient shows in Frinza, Kenter S, Martin's and others, desired, to J, 134 and 134 in secretarity Exhibitions of Portiland centers, but have added to them simples of various in the control of the property of the control of the control of the decentred. sideration. The cost of the articles in the Exhibition

would be about 201.

Mesers. Oast and Armant (36, p. 766) are the exhibitors of a material called metallic lava, which is a plaster capable of being worked into a variety of patterns and colours, as illustrated in the Exhibition, and well adapted by its beauty, dorability, and cheapness, for floorings and other decorative purposes, amongst which is a table in the Moorish style, intended for the President of the French Republic.

Two different kinds of the metallic lava are exhibited; one of which is white and ornamental, and admits of the application of mosaic work; and the other brown, and peculiarly adapted for covering roofs and terraces, lining tanks, cisterns, fish-ponds, brick walls, stables, &c., where a durable, cheap, and impervious covering is required. Both kinds have stood the test of experience, and are knowe to be well adapted for the object they are jutended The composition is patented, and the method of layfor. The composition is patented, and the become of any-ing down a flooring or terrace without trace of joints is both new and advantageous, insuring the perfect imper-menbility of the whole to moisture. A Prize Medal is

uwarded to these exhibitors.

To Messrs. Della Valle Brothers, of Leghorn (Tuscany, 120, p. 1300), a Prize Medal has been awarded for a new and peculiar manufactore in scagliols, to a certain extent imitative of works in Floreutine mosale, but applied in cases which would be impossible by that The objects exhibited consist of two tables and a vase, all truly inlaid, and baving a striking and very hrilliant effect. This kind of manufacture differs from ordinary scagliols in the much greater complication of the process, and also in the greater beauty of the result, as the subjects include figures and views which at first appear hardly possible to be executed in such material, but which show great labour and skill, and some artistic knowledge in application. One of the objects, a round knowledge in approximation. One or any other table, contains a central tableau, surrounded by an azure tiself is of seagliola on a base of marble, each colour composing the ground, and each figure of the central tablean has been first inlaid in a single piece and then tablean has been first inside in a single piece and toen shaded. The lights also are all inlaid, and the general effect is extremely beautiful. It will be seen that the general principle involved is that of a mixtore of fine ingeneral principle involved is that of a mixtore of Inte un-laying with shading. It would appear, however, that the result, although beautiful, is almost too costly to be gene-rally adopted, as the price of the round table referred to it stated at 250d. The rectangular table in initiation of pietra dura, and the vace, which is copied from the ansuccessfully overcome. The polish in all the specimens is very good, and entirely natural, no varnish whatever being used

Mr. L. Rowold (Class XXX., 351, p. 842, and Tuscany, 124, p. 1300) exbibits a scagliola candelabrum in imitation of giallo antico, designed by L. Gruner, Esq., modelled by Aut. Trentanove, and the property of His Itoyal Highness Prince Albert; and also a table in inlaid scagliols, shown in Tuscany. This exhibitor is Honourably Mentioned as exhibiting excellent workmanship in the elegant and costly applications of the material he employs. The candelsbrum is not altogether pleasing in its effect, but the workmanship is good. The inlaid table is something in the style of those exhibited by the Messrs. Della Valle, but not at all equal either in design or execution. It ap-pears also to have been manufactured in a somewhat different manner. A cement mossic in imitation of wood and marble was sent from the Cape of Good Hope for exhibition,

c. Artificial Stone with Silica Base.

As constructed in a manner and on principles altogether distinct from those of both lime and gypsum cements, we must next mention an artificial stone recently introduced by Mesars. Rassons and Passons, of Inswich, and some-what extensively exhibited in Class XXVII. (97, p. 771-2). This material is a compound consisting of graius of sand, pebbles, portions of timestone, marble or granite, elay, or adeed any other material, cemented together by a true

glass obtained by dissolving flint in caustie alkali in a boiler at a bigh temperature, mixing up the materials with this solution into a paste of the consistence of putty, moulding this paste into any required form, and after slow air-drying, burning the articles thus manufactured in a kiln at a bright red beat maintained for some time. In the course of this process, the alkali combines with the free silica and forms a kind of glass, so that the materials become comented together by a substance which does not admit of the smallest absorption of moisture, and is consequently absolutely unattackable by the frost. It also resists every other kind of atmospheric action and is extremely bard. It possesses besides the great advantage of not contracting sensibly during the last process of buking.

It may be well to state briefly the details of manufacture in this case. The flints are used in the rough state in which they are found in the chalk, and of large size. They are suspended in wire baskets in a high-pressure boiler, the pressure being from 60 to 100 lbs. on the square inch. For about a ton or ton and a half of flints, about a quarter of a ton of caustic soda is required (about 56 per cent. of alkali). The resulting substance, a fluid silicate of soda, is drawn off every 48 or 56 bours, the quantity being about 200 gallons, and is afterwards eva-

porated down to a specific gravity of 1'165, when it is fit for use. The further process is sufficiently described above. Although this kind of artificial stone appears to offer many advantages, it is right to mention one objection to its use which has not yet been obviated, consisting of an efflorescence of some of the salts of soda, greatly disfiguring

the appearance of the work.

Besides artificial stone adapted for all kinds of garden work, for paving, and for architectural decoration, it has been found easy to manufacture a porous variety for filter stones which may be made of any size, admirably answer the purposes for which they are intended, and are sup-plied at extremely small cost. They are cleaned with perfect case, and may be contrived so as to be applied perfect case, and may be contrived so as to be appared without a reservoir to filter water, delivered to houses by the system of constant apply). The cost of a filter pas-ing 300 galloms per day would be 504, and samal filters are prepared for the use of travellers, the price of which is only 3s. Besides these sales, permanent ascending filters are prepared with the same material, the price of which, complete, varies from 15s. to 4l., sopplying daily from five to sixty gallons: these are especially adapted for ships and domestic purposes. Other very useful arti-cles have been manufactured of the same kind of material, among which seythe-stones and other grindstones may be mentioned. The Jury have awarded a Prize Medal to these exhibitors for the improved material they have introduced, and the applications of it they have already made.

d. Bituminous Cements and Mustica.

Another and quite different kind of cement is made chiefly with bitumen. It is now well known both in England and on the Continent, under the name of asphalte. The pavement laid down at the east entrance of the Exhibition by the SEYSSEL ASPRALTE COMPANY is a good sample of their material, and a Prize Medal has been awarded them for this object. The asphalte is generally obtained from natural sources, where it is combined with a large per ceutage of carbonate of lime, reaching even to 80 per cent, or more, and the combination is so perfect that the rock in this state long resists the action of muriatic soid. Less pure kinds contain sand, which is found to be injurious. The best kinds of asphaltic rock are converted into a plastic workable mastie in a short time, and at very little cost, merely by the addition of 6 or 8 per cent, of mineral or coal-tar and a few pebbles, the union being effected in an iron cauldron at a very moderate heat, and the viscid mass placed on a prepared that sur-face. The advantages of this kind of pavement are its extreme toughness and power of resisting very considerable wear. Such a pavement absorbs no water and makes very little dast.

Mr. J. B. Durous (France, 485, p. 1201) is also the exhibitor of an asphalte adapted for pavement of this kind, as well as of mosaic work of natural stones cemented by asphalte. This use of the material is fully appreciated by the Jarry, and must be extremely valuable. It has, however, been long known, and indeed the application of hitumen dates very far back in the history of civilization, as we find that it was commonly employed by the ancient Egyptians, and formed a sold and durable cement in the walls of Habylon. The Jarry award an Honourable Mention to Mr. Dopfour far his exhibition.

e. Metallic Sponge Cement.

A very corious and ingression, contrinence for a pure men in exhibited by Mr. A. Chromy-(Presse, 118), ment in exhibited by Mr. A. Chromy-(Presse, 118), mind raise, may be of importance under certain circumtances. K. GLASS AND PORCELAIN MORAICS.

The set of inkying, when the material island consists of numbers of numbers of numbers of the process, gain, are provided, instead of of numbers of the control of the cont

a. Roman and Venetian Mosaic.

The manufacture of true Roman mosaic has always, we believe, been confined to the city whence its name is taken, and no country has entered into competition with Roma in exhibiting specimens of it. The Reporter has received the following account of the manufacture from

M. Pistrucci, Chairman of the Jury :-"The mosaics which are made in these times are composed of pieces of glass, sometimes called smalt and sometimes paste. They are made of all kinds of colours, and every different bue, and for large pictures they take the form of small cakes. For small works they are produced in threads, varying in thickness from that of a piece of string to the finest cotton thread. Heaps of these, of all tints and colours, are prepared. A plate or slah of copper, marble, or slate is then provided, of the size and thickness required for the intended work. This slah is hollowed out so as to resemble the bottom of a box or a tray, to a depth proportioned to the work; this may vary from an inch to the eighth, or even the sixteenth of an inch, if the work is to be small. This bollow is then filled with plaster of Paris, well smoothed, on which the outline of the proposed design is very accurately traced, and an inked pen is passed over the outling to preserve Very few tools are required by the workmen; but fur the large works, where comparatively large pieces are to be inserted, small sharp-entting bammers are made use of for splitting the cakes and reducing them to their proper size and form. Pincers also, of different forms, are used for placing them equally. In very small works, instead of hammers, sharp-pointed pincers are made use of, like those with which diamonds are taken up, and sometimes a small tool like a scarpello. The heat of an oil lamp is required to enable the workman to draw out the strips of glass to the fineness be wants, even to that of a bair. When this is all ready, the first operation is to dig or scoop out, with a scarpello of the proper size, a

small piece of plaster of Paris from the bottom of the box or tray, without injuring the outline. This is filled up with a kind of mastic, like that which is used to fix panes of glass in the sashes or frames of a window, the required piece of smalt or glass is then pressed into the mastic or composition. In this way, step by step, and from day to day, repeating the operation of scooping out a small piece of plaster of Paris, and never losing sight of the outlines, they gradually fill up the whole tray. In works of considerable dimensions the workmen place the tray or plate before them as painters place thu canvas on which they are painting, and have the original always close to them. For smaller works they sit at a table, as if writing, and generally keep their work flat ou the table. The designs used in these mosaics are, for tho most part, copied from the pictures of some artist of eminence, the designers themselves being also a separate body, working for the mosaicisti, who mechanically fill np the spaces as above described. It is true, however, that though these last cannot be called artists, nevertheless those who distinguish themselves in the art must be endowed with a good natural taste, a true and correct eye, and great perseverance, to enable them to copy the various times and forms of the original without injuring the outline. I am not aware that any mosaiciste has ever worked from his own original design, or even that he has drawn the outline on which he works. When this opera tion is completed, it is passed over a stone made perfectly smooth and cleaned of every kind of dirt. But as it will always happen that interstices, bowever minute, will be left more or less between the several small pieces of smalt inserted in the mastic, these are to be carefully filled up with heated wax, applied with hot-iron instru-ments from a pallet on which it has been prepared for the purpose; and much of the good effect and finish of the work will depend on the ability and care of the workmen by whom this operation is performed," The Exhibitors of works of Roman mosaic are six in

andher, and the Council of Chimme have accorded to make a country of the Pary of the Class to give a the recommendation of the Pary of the Class to give a the most reportable as the Part and the Class to give a the most reportable as the Part and the Class to give a proposal part of the Part and the Class to give a the most reportable as the part and the Class to give a to be rehabit in a large round table, designed and received by the country of the Part and the Class to give a the results of the Part and the Part and the Class to other estebated means, not exhibited, the Jury have conceasingly are the Class to the Class to give a the material to the nature of the week and the style of deeping, the explained making of the colors, and the style design, the explained making of the colors, and the style design, the explained making of the colors, and the style assumptions and sky of each mingling into the same elsethems are the specimen of the Class to constitute the colors of the part and the style of the colors of the colors of the colors of part and the part and the part and the part and the style assumption and the part and the

sonare sish, and a picture presenting a view of Pustum, all in Roman mosaic, and all admirably excepted. The other exhibitors of similar objects, viz., RESEDETO BOSCHETT (ROME, IT, p. 1286), artist; DOWNSTON MODILAR (ROME, 21, p. 1286), and ANTONIO ROCCHIGHANKI (ROME, 22, p. 1286), are Honorardly Mentioned, as having show a admirable specimens of the same curtous art; and to the former a Piris Medal has been awarded.

former a Prize Medal has been awarded.

It is right to mention that since the opening of the Exhibition, and indeed since the investigations of the

Jury have been completed, several objects in Roman mosate have been added, which are chiefly of small size, but which deserve high commendation for their beauty. Several members of the Jury having left town, it has been impossible to reward in any formal manner the exhibitors of these, although they well deserve to be mentioned with the others.

A group of objects is exhibited in a new kind of glass mosaic, by Mr. G. H. STEVENS Class XXX., 158, p. 830), executed at about one-third the price of the ancient manufacture of this kind. These objects include a pair of spiral candelabra, made in Keene's coment, in imitation of marble, islaid with various patterns of glass mosaie, and intended for the decoration of a hall or drawingroom. The glass is in large tesserie. There are also glass mosale tables, a slah containing various patterns for gass mosaic usoes, a san containing various patterns patterns of panels, and a specimen of heraldic decoration. The glass is stained or gift, and the method is adapted for many purposes. The Jury have thought the method worthy of Honourable Mention,

b. Clay and Porcelain Mosries.

No Exhibitors can at all compete with Messrs, MINTON (86, p. 770) for the variety, beauty, and excellence of the encanatic and mosaic tiles manufactured by them by a process which involves very great mechanical ingenuity, and which has been carried to a very high pitch of per-fection. Messra, Minton have, indeed, to some extent, followed in the track of similar manufactures among the ancients, both with regard to the uses, forms, and pat-terns of their tiles, for paving and walls; but they have very greatly improved all the mechanical contrivances, ducing one method more especially-enormous compression to consolidate dry elay—which deserves very distinguished notice, and has been the commencement of an entirely new era in mosaic work in plastic material. To Messrs, Minton, accordingly, the Jury recommended a Council Medal, and the award was recognised by the council mean, and the award was recognised by the assembled Group of Juries, and sent to the Council of Chairmen for confirmation. These Exhibitors had also received the same honour for their manufactures in poreo-lain generally, and there is thus a joint Council Medal given from Classes XXV. and XXVII. The tiles exhibited by Messrs. Minton are of three

kinds, vis. :-1. Encaustic, or Inlaid Tites .- These are made by pressing clay in the plastic state into an embossed plaster mould, the pattern or design on the mould being raised. When the tile is withdrawn from the mould, the outline of the pattern is indented; and the indented parts are then filled in with liquid coloured clays, according to the colours it is wished to produce. The surface is then Scraped quite flat, until the pottern appears well defined.
The tile is then fired, which brings out the colours to the

proper tint. Venetian Tiles and Mosaics.-These tiles are pro 2. Feetina Ties and Mossics.—I nest titles are produced by the compression of powdered clays in metal dies, of any geometrical form that may be desired; the clays having been previously stained with metallic colours. Each tile or tessen is, of course, of the same colour throughout. When fired, they are arranged on a smooth of the same colour and the colours. platform with the face downwards, according to the design intended; after which liquid Roman or Portland cement is poured upon them, and they are thus formed

into slabs of any size required. Tiles made after the manner of the Albambra, and other Spanish Tiles.—There is only one example of these tiles in England, and that is in the Mayor's Chapel at Bristol,

supposed to have been presented to a predecessor in the civic chair by a Spanish merchant. These are made by pressing plastic clays on an embossed mould, which forms grooves or indentations. These tiles are then fired, and come out of the oven with the pattern formed. The indentations are then filled in with enamels of various colours, and fired again, which produces a brilliant effect, and renders the tiles suitable either for floors or casing

To Mesers, Alfred Sinces and Co., of the Vauxhall Pottery (88, p. 770), a Prize Medal has been awarded for a mosaic pavement composed of tensers of vitrified

clay of several colours and shapes, all produced by machinery with great rapidity and facility, and without the necessity of chipping any of the tessers. The machine is patented by the Exhibitors; and, besides making tesserie of the usual form and size, is capable of subdividing them in such a way that, with comparatively few shapes, an endless variety of patterns can be executed, the joints being preserved in straight lines throughout the whole pavement

The mode of working is as follows:-The clay being propared in the usual way, by washing and sifting, and stained with various metallie oxides, is formed machine into long thin ribbands, about I inch thick, and 3 or 4 feet long. Out of these ribbands the tessers are cut by the patented machine with great rapidity, and when dry are baked in saggers in the usual way.

The pavement slabs are made by laying these tesseno face downwards on a perfectly flat slate, the pattern being of course reversed, and covering their backs with a layer of Portland eemeut and two layers of rough thin tiles, carefully embedded in the cement, In this way strong slabs are formed, of about 17 or 2 inches thick, strong anns are isomet, or about 17 or meets time, which are almost perfectly impervious to moisture or rising damp, and can be laid down by any msson. The exhibitors consider that they may fairly claim merit for the introduction of the method, and the flatness

and durability of the surface, as well as its impermeability, The work can be produced at from 2s. 6d. to 5s. per square foot, according to the size of the pavement and that of the tesserse. The specimen in the Exhibition is

walled at 3s, 6d, per square foot,
Messrs, Marchest and Ossoli (Rome, 13, p. 1285) are exhibitors of a number of slabs of cement, of very good quality, prepared for pavement, and imitative of marble mosaic. They have received Honourable Mention for these objects.

Group 4. - MANUFACTURES IN CLAY. The number of objects exhibited belonging to this

group is considerable, and of great importance. The number of exhibitors is not, however, very large, amounting only to between eighty and ninety, of whom nearly forty are foreigners.

Of the English exhibitors there are some remarkable for excellence of various kinds, but especially in fire-clay

goods, terra-cotta, salt-glazed ware, tiles, drainage-pipes and bricks. Of each of these there are several. France has as many as twelve exhibitors sending terra cottas of great beauty, and some fire-clay goods,
Belgium has only four, and all of fire-clay goods, con-

livingum has only nour, and an or invest, as sixting of retorts and crueibles. Of the various States of the Zollverein there are four from Saxony, and one from Bayaria, almost all of chemical apparatas; besides four from other countries, of brick and terra-cotta, Austria has only one, but a very important exhibitor in bricks, Italy has also only one, who sends a clay mosaic pave-ment. From the Peninsula there are four; two of them sending samples of the large jars for which Spain and Portugal have long been famous. From India are several specimens of bricks and terra-cotta; and from the United

States are a few objects of some interest. L. Baicks and Tiles.

Among the materials used for construction none are more really important than bricks, these articles being manufactured of a substance almost universally attainable, worked into a form convenient for use, hardened and rendered more or less impervious to moisture by a partial burning, and when used, cemented together with mortar, or some of those substances described in the first group of plastic materials. Bricks have been employed from the earliest period, and are still as necessary, if not more so, than ever; and, whether in the form of common stock bricks, or any modification for huilding purposes, or as flat or other hrieks for roofing or paving; or lastly, as gutters or pipes for drainage, the number used is so large, and the interest concerned so universal, that even the smallest improvement, either in the mixture of material, the method of hurning, the method of uniting, or indeed any other matter, is of really untional importance.

The facts with regard to bricks have reference to the kind of clay used: the admixture of clay with other material; the size, shape, and proportions of the brick, tile, or pipe; the mode and extent of horning; the production of any glaze or other peculiar surface; and lastly, the mode of using them and attaching them together. It will be found that several contrivances, more or less ingenious, and more or less complete and efficacious, have been submitted for exhibition, and have come under the consideration of the Jury, and the Reporter regrets that this subject, the interest and extent of which he folly recognises, should have been left to him to describe and dilate opon, sensible as he is that the want of professional and practical acquaintance with the arts of construction must seriously interfere with the doe execution of his

task In speaking of the exhibitors of these articles, it will be convenient to consider them grouped, as far as possible, in regular order. We propose to treat them as follows, although it may sometimes be necessary to depart from this plan on account of single exhibitors sending objects

- of different kinds :-
 - General improvements in building contrivances, such as hollow bricks, glazed bricks, &c.
 New and peculiar forms of bricks and ornamental
 - hricks.
 - 3. Common, waterproof, and white bricks. 4. Roofing and paving tiles.
 - 5. Drain-pipes, &c.
 - 6. Bath or scouring bricks.

We have mentioned in the commencement of this Report that a Council Medal had been awarded to the SOCINTY FOR INTROVING THE CONDITION OF THE LABOUR-Society for large of the Committee of the Lakotz-tac Classes (pp. 774-5). For their improvements in the arts of construction as applied to dwelling-houses, and espe-cially to those of the lower classes. Those only who have visited the dwellings of the labouring population, as at present constructed in large to wms, are at all aware of the overwhelming necessity for some great and rapid improvement, and of the vast alteration that might be effected in the moral condition as well as the health of the poor, if the decencies of life were attended to in their habits By introducing a system of construction remarkable at once for strength, elecaliness, warmth, ventilation, dryness, rapidity of completion, safety from fire, and economy, this Society have established claims deserving of the highest acknowledgment, and have insured the gratitude of multitudes who have not yet learned the advantages they will derive. The contrivances include a poculiar form of hrick, made tuhular; moulded articles in clay for window-sills, mulijons, &c., soil and other drains, earthenware water-closets, &c., besides kitchen-ranges, fron bedstends, &c., which do not come under the consideration of the Jury. Many of these are illustrated, not only in the Exhibition (Class XXVII., 124, pp. 774-5), but in the lodging-houses constructed by H.R.H. the Prince Albert, opposite the Exhibition Boliding in Hyde Park; but it is well to state that the cost of these cottages need not hy any means be taken as a model for similar constructions elsewhere, and that, on the contrary, the houses that have been actually erected show a sufficient return for the capital invested, and even at very moderate rents promise

to prove profitable in a strictly commercial sense.

Of all these contrivances the Society appear to put forward the principle of tubular bricks as of first importance. It is true that the idea is by no means modern, similar materials having been employed by the Romans when lightness was needed, as in large vaultings, and being described as of common use at this day in Turis, and other parts of North Africa, where they have indeed been employed for many ages. Bricks of this kind, of somewhat peculiar construction, have been patented by II. Roberts, Esq., F.S.A., the Honorary Architect of the Society, and have been illustrated by the Society in the Exhibition, the one kind made wedge-shaped (the value of which form is doubtful), and bonded longitudinally over each other, so that two cavities run parallel through every course, giving a double security against moisture, diminution in the cost of cartage or tra and much facility for ventilation. We quote the following 25 per cent, on the mortar and the labour,

from a paper published by the Society, and distributed hy them

The dimensions being unlimited, a size has been chosen which, with the omission of the headers, reduces by about one-third, the number of joints, and greatly improves the appearance of the work, giving it more boldness of effect and resemblance to stone than that of ordinary brick-work. This size is twelve inches long, and three courses rise one foot in height; a size equally convenient for the workmen in the manofacture, and in the use of the bricks, for, whilst less liable to damage in moving than those of larger size, their form admits of ready handling and

stowage for transport. Nine patent hollow bricks of the size before described will do as much walling as sixteen of the common sort, whilst the weight of the former but little exceeds that of the latter, an important consideration in reference to

carriage as well as the labour in using.

When passing through the machine, or in the process of drying, any number may be readily splayed at the ends for gables, or marked for closures, and broken off as required in use; or they may be perforated for the pur-pose of ventilation. If nicked with a sharp-pointed ham-mer, they will break off at any desired line; and the angles may be taken off with a trowel as readily as those of the common make,

A sufficient proportion of good facing hricks may be selected from an ordinary hurning, and in laying them a much better bond will be obtained than is usually given

in common brickwork. The bricks for the quoins and jambs may be made either solid or perforated, and with perpendicular holes, either circular, square, or octagonal: those in the quoins may be so arranged as to serve for ventilating shafts. Stone will be found equally applicable for the quoins and jambs, and the appearance of the work be thereby

improved.

Hollow bricks may be made with any good tile machine, in the same manner as ordinary draining pipes, and at about the same cost, in proportion to the quantity of clay contained in them. They are more compressed, require less drying, and with much less fuel are better burned than ordinary bricks, even when only waste heat, or that

The saving in brickwork effected by the use of the tent bricks, when made at a fair price, will be from 25 to 30 per cent, on their cost, with a reduction of 25 per cent, on the quantity of mortar, and a similar saving on the labour, when done by accustomed workmen. The process of drying is moch more rapid than in common brickwork, and the smoothness of the internal surface of walls built with the patent bonded bricks renders plastering, in many instances, quite unnecessary, whereby a further saving is effected, not only in the first cost, but also in the subsequent maintenance. If glazed on the outer face, as may be done with many clays, a superior finished surface is obtainable without plaster.

STATEMENT showing the Comparative Cost of a Rod of Reduced Brickwork, boilt with ordinary Bricks of the common size, and a Rod built with Patent Bonded Hollow Bricks:-

4,300 ordinary bricks to a rod, at . 2,450 Patent Bonded H. Bricks, ,, 25s.	:	:	3	6	3
Saving in bricks per rod .	٠		£1	4	9
4,300 ordinary bricks to a rod, at 24s. 2,450 Patent Bonded H. Bricks, ,, 30s.	:	:	5	3 13	3 6
Saving in bricks per rod .		. !	£1	9	9

Faving in bricks per rod .		. !	εı	14	8

This shows an advantage of 29 per cent, in favour of the patent bonded hollow bricks, in addition to a considerable diminution in the cost of cartage or transport, and of The relative prices given above may be taken as the fair average sching prices, de-peding on the cost of relative average sching prices, de-peding on the cost of relative for parties of parties who have so sake these bricks as I official sching of the prices of parties who have so sake these bricks as I official statement that 30s, per 100s may be considered as a fixer asterness that 30s, per 100s may be considered as a fixer price. Owing no their larger discussions, this corresponds to 16s, 101d, for the common nort, or if the contractive of the contractive

In concluding this notice of the centrivance here referred to, the Jury are desirous to place it distinctly on record, that the Cunneil Medal is awarded to the Seciety for their exhibition generally, as exemplifying their efforts in various ways to improve the durellings at the labouring classes, and not for any particular part of it.

A very ingenious mechine exhibited by Messes, Boazz Borruses (Figure 4, 47; p. 1188) is well adapted for the manufacture of Indotate bricks of the best quality, with the manufacture of Indotate bricks of the best quality, with the state of the state of the state of the state of the bricks are extremely hard and strong. His day, that the size childred is very horry, and there are a many as nine small tober ramping longitudinally through state of the state o

N. GAS-RETORTS, FIRE-RRICKS, &C., AND CHEMICAL UVESSILS.

We have already mentioned the use of fire-clay (obtained generally in this country from beceath certain scams of coal, and its value in the manufacture of terracotta, where being burnt at a high heat, the clay requires to be of such a nature as to resist fusion, or in other words, to have the property understood by the term re-fractory. Many other specimens of manufactured fireclay have been sent, adapted to special and most important urposes, and we proceed now to enumerate the exhibitors, and the nature and degree of excellence of the objects exhibited. It is to be regretted that there are not more exhibitors to compete with each other in this department, but some of those to whom we shall allude have sent specimens which are highly creditable.

The Reporter has had the advantage of an opinion and report communicated by George Lowe, Esq., C.E., F.R.S., one of the Associate Jurors in this matter, whose judg-ment has assisted in guiding the Jury in their awards. Mesers. Joseph Cower and Co., of Blaydon Burn, Newcastle-on-Tyne (112, p. 772), are exhibitors of samples of fire-clay, fire-bricks, and patent fire-clay gas retorts, which are all of admirable quality, and bear the highest reputation. The Jury have, therefore, awarded a

Prize Medal to them.

The use of fire-clay is not of very nacient date, and has greatly increased within the last few years. It is found in England almost exclusively in the coal mensomes, and from different districts the quality is found to differ considerably. The so-called "Stourbridge clay" is the best known, and will be alluded to presently; but other kinds are almost, if not quite, as well adapted for the higher purposes of manufacture, being equally free from alkaline earths and iron, the presence of which renders the clay fusible when the heat is intense. The proportions of silica and aluminn in these clays vary considerably; the former amounting sometimes to little more than 50 per cent., while in others it reaches beyond 70; the miscellaneous ingredients ranging from less than

11 to upwards of 7 per cent.

The works of Messrs, Cowen and Co, are among the most extensive in England, and they obtain their raw material from no less than nine different seams, admitting of grent and useful mixture of clay for various purposes. After being removed from the mine, the clay is tempered by exposure to the weather, in some cases for years, and is then prepared with extreme care. The objects chiefly made are fire-bricks and gas retorts; the latter being now much used and preferred to iron for durability. These retorts were first made by the present exhibitors in ten pieces (this being twenty years ago), and since then the number of pieces has been reduced successively to four, three, and two pieces, till, in 1844, they were enabled to patent a process for making them in one piece; and, at the present time, they are thus manufactured of dimensions as much as 10 feet long by 3 feet wide in the inside, which is, however, more than double the size of the largest exhibited by them,

The following extract from the Report with which Mr. Lowe has favoured the Jury, will be read with in-

terest. He says

"I recommend this exhibitor from my own knowledge as connected with the extensive furnace work of the as connected with the extensive furnace work of the Chartered Gas Company doring the last thirty years, at which period we were baying Stourhridge goods from 81. to 100. per thousand, when a fair trial of Mr. Cowen's bricks, at just one-half the price, convinced us then, and have ever since proved to us their excellency. One especial feature in these bricks and retorts visible to the eye, and so essential to their withstanding high heats, is destroying the otherwise good properties of many fre-

This he arrives at by following the Chinese practice of submitting his elay for years exposed to all weathers, turning it frequently over, whilst young hands pick out the fossiliferons fragments, generally pyritous, which this disintegrating process lays open to observa-The elay contains a high per centage of silica. Add to these points great care in the manufactory, in which every appliance is to be seen, and we have nearly the secret of Mr. Cowen's fame. He has testimonials from all quarters, one from Rouen, stating thirty-eight mouths as the durability of some of his retorts, being four times that of iron ones

The fire-bricks exhibited by Messrs. Cowen are sold at The ner-optices exhibited by newers, Cowen are sold after from 46ts, to 50s, per 1,000 on board at Newcastle, the price varying with the size. The same articles are delivered in London at from 50s. to 70s. The retorts are from 60s. to 80s, each at Newcastle, and in London from

5s. to 10s. more. Messrs. Hangen and Moone, of Stourbridge (119, Messrs, Harpyn and Moone, of Stourbridge (119, p. 773), are exhibitors of fire-clap bricks remarkable for their hardness; and they also seed a glass pot. All these objects are well made, of good colour, and free from irou; and are considered worthy of Honourable Mention. The large pots are used in the manufecture of place, erown, and sheet glass; and those of smaller size in the manu-fecture of filot glass: the pots remaining in the finnance till worn out or broken, and lasting sometimes for two One of the vessels with an open top (called a currett) is used to convey the melted glass from the interior of the furnace to the custing-table for plate glass. a test, perhaps, the most severe that a fire-clay vessel can be put to, but which some of those made by these Exhibitors have stood 180 times without breaking. The purest fire-chay, in which iron is entirely absect, is needed for such

purposes. The wholesale price of the curvetts is 40s. each, The erucibles shown by Messrs. Harper and Moore are made by hand, and are extensively used for brass, iron, steel, silver, gold, and other metals. The bricks used for lining the inside of glass-bouse and other furnaces, where long-continued and intense heat is applied, are also

of good quality.

Glass-house pots are also exhibited by Messrs, Squince and Sons, of Stourbridge (Class L, 117, p. 133), and Messrs. HARTLEY, of Sunderland.

The eclebrated fire-clay used by these and other Exhihitors, and so widely celebrated as Stourbridge elay, lies about 15 feet beneath the lowest of three workable seams of coal (each averaging 6 feet thick), worked at Stonrbridge in the lower coal measures in the south-western extremity of the Dudley coal-field. The hed of elay is four feet thick; and the following is the composition, according to Berthier, quoted in Dufresnoy's "Mineralogie," vol. lik, p. 259:-

Other British Exhibitors of similar objects are Messrs King, of Stourbridge (Class I., 91, pp. 130, 131), well known for their manufactures of fire-clay goods from this celebrated district, and the Exhibitors of a large and interesting series, including the raw material unburnt and finished articles of manufacture, and a small model of a glass-house. Owing to some cause, the goods here shown are not altogether such as to do eredit to the maker. The best objects from Messrs. King are the crucibles, and the greatest interest attaching to their group arises from the fact that the raw or unburnt pots, &c., are shown as well as those which are burnt,

Gas retorts of very fair quality are shown by Mr. RANKAY, of Newcastle, who has also succeeded extremely well in the manufacture of fire-bricks, chimney-pots, and other goods. The retorts show a little more iron than is desirable, but the Exhibitor has been considered worthy of Honourable Mentioo, Retorts of less creditable appearance are exhibited by Mesars, HICKMAN and Co., of Stourbridge (Class XXVII., 107, p. 772), and Mr. A-POTTER, of Newcastle (Class XXVII., 115, p. 773). The surface of both these retorts is cracked and undulating. When we consider the high and long-continued temperature to which these objects are exposed, the absolute necessity of attending to every detail in mixing the clay and moulding the retort will be at once recognised; and the apparently slight defects of some of those sent for exhibition, require to be noticed as of real importance, Mr. J. Pease (Class I., 122, p. 133) is Honourably Mentioned for some fire-bricks of excellent quality exhibited by him

Next to England, the finest specimens of fire-clay goods, on a large scale, are from Belgium, from which country there are three exhibitors of gas retorts. Jury have awarded a Prize Medal to one of these, Mr. T. BOUCHER, of Baudoar (399, p. 1163., who has sent a well-made retort, extremely thin, of good structure, and free from surface iron and cracks. The Jury have awarded the Medal to this Exhibitor on account of the undoubted superiority which it presents over other similar objects from the Continent, and do not enter on any question of priority of manufacture that may arise, or identity of methods adopted by this and other Exhibitors.

The Jury have awarded Honourable Meution to Mr. A. SMAL-WERPIN, of Huy, Longe (398, p. 1163), for a neathy-made retort of rather indifferent colour; and also neuty-mone retori of rather indifferent colour; and also to Messrs. B. Pasron and Co., of Ariennes, Namur (395, p. 1163). (granted by Class I. likewise', whose retori is extremely thin and well made (thickness only 23) inches;, but faulty in colour, the floxy appearance indicating the presence of iron, which cannot fail to act as a flux. Besides the retort, these Exhibitors bave sent fire-bricks and lumps, having the same fault in colour,

but very beautiful in point of manipulation Frauce has sent only one specimen of fire-clay gas retorts, and that not remarkable for excellence. The Exhibitor is Mr. Pauwells, of Paris (1382, p. 1242), who exhibits also an ingenious gas moderator, which does not come before the present Jury for consideration. Fire-bricks and vases are sent by Mr. DE HOISSIMON, of Langeals (427, p. 1199), an eminent manufacturer on the Loire, who has been already referred to, and has received Honourable Meation

Refractory bricks are sent by two Exhibitors from Portugal and one from Spain. Of the former, some (275 to 278, p. 1311) from the Manuracrony at (275 to 278, p. 1311) from the MANUTACTORY at BELISOENS, promise well, but there is no proof of their excellence beyond the appearance of the brick. They are, however, Honourably Mentioned, and the Jury also mention in the same way Mr. Jose Ferraseria Pixro Barro (Prize Medal in Class XXV.), of Vista Alegre 279, p. 1311), who exhibits refractory bricks. The . ury are informed that these bricks are made of a clay also used for earthenware, and certainly admirably adapted for the finer works of this kind, and that the Exhibitor is the discoverer of this bed, which has been used for more than a quarter of a century in the porcelain works at Vista Alegre, now very extensive. Great credit appears to be due to Mr. Pinto for the persevering induswith which be has struggled against numerous difficulties, and succeeded in introducing into his country a most useful and important manufacture. The bricks exhibited are neat, and appear of good quality. They contain much of what is technically called "grog" (coarse fragments mixed with fine paste), which renders them capable of standing a sudden application of heat without eracking, but the small extent of the exhibit does not justify the Jury in giving more than Hononrable The bricks sent by the AULENCIA COMPANY at Madrid

(53, p. 1332) are light and of open texture. The colour is very white, and the raw material, which has only been brought into use very lately, appears to be of remarkably fine quality. As there bappens to be a considerable demand in Spain for various articles of fine pottery, the more extensive working out of this deposit appears to be a very important matter.

and brick crucibles. Mr. Von MULMAN, of Sieghurg on the Rhine (West Prussia, 319, p. 1008), who also sends chemical utensils. This manufacturer makes fire-bricks for blast furnaces and puddling furnaces at a very mode-

Besides the objects in refractory clay already considered, there are some others, chiefly chemical intensils, which, from their condition, magnitude, and other circumstances, are referred to Class XXVII., and which, therefore, it becomes our duty here to report upon. For this purpose the Jary called in the aid of an Associate Juror, T. H. Henry, Esq., F.R.S., and have perfect confidence in the results they bave been enabled to arrive at,

The largest and most important exhibitor of crucibles manufactured of an admixture of fire-cluy and plumbago, and required for purposes where an intense beat is employed, as for the melting of steel and reducing the precious metals, is Mr. H. W. RUEL, of Loudon (Class I., 435, p. 16t), to whom a Prize Medal has been granted The crucibles in question are described, both in this and other countries, as if made of plumbago, but consist, in fact, of an admixture of that mineral, in variable proportions, with the finest and purest fire-clay. The introduction of the plumbago, is, however, n very important modification, and acts by preventing the injurious effects of contraction and expansion during change of tempera-Besides plumbago, other forms of carbon are sometimes used, especially pounded coke. The best crucibles for the purposes that require the greatest resist-ance, are either made of one-half of a finely-ground cement or paste, consisting of old crucibles and fire-clay and one-half coke and graphite, or of larger proportions of clay; but those used for the assay of the precious metals are sometimes made of two-thirds graphite.

The crucibles of Mr. Ruel are of the very best quality. The crueinose of Mr. Risel are in the very oest quantry, and the Associate Juro, Mr. Benry, thus reports of them:—"Mr. Risel has so improved the black-lead or plumbago crucibles, as to drive the fureigners out of the English market, and his articles are preferred abroad. I have repeatedly tried them and have found them excellent. Messrs, Brown and Wingrove, the gold smelters, use them exclusively, I understand, and in order to make sure I have asked them for a written upinium.* Ituel's ossay eracibles resist the action of fused oxide of lead much better than any others I have tried. Mr. Ruel is, I believe, the oldest crucible maker in this way, and I think his grent merit lies in working steadily for a considerable time to improve the English manufacture, and gradually vanquish the strong prejudice in favour of a foreign article by the superiority of his own pro-

To Messra. Lonenz, Kapeller, and Son, of Hafnerszell, near Passau (Bavaria, 28, p. 1099), a Prize Medal has also been awarded for black-lead eracibles, which are described as of more refractory character than usual, and which appear to justify this account. The specimens sent lude one of very nausual dimensions, measuring 2 feet bigh and 20 inches in diameter. They are very well made. These manufacturers have long eujoyed a very high reputation in the Eoropean market, and their crueibles are extensively sold, having been generally regarded as the nearest rivals to those made of Stourbridge elay.

Mr. F. Coste, of Tilleur, Liège (Belgium, 397, p. 1163), is an exhibitor of plumbago crucibles nf good quality, and is considered worthy of Honourable Meution. Those he exhibits are of two kinds, one of them not containing plumbago, but the former, adapted for melting steel, are so contrived as not to require removal for a fresh clurge, and thus present a novelty of construction

Other plumbago crucibles are sent by Mr. G. B. Arwoop, of Massachusetts (United States, 426, p. 1463), but they are understood to be really English, made from

The written opinion thus requested has been submitted to the Jury, and establishes the fact that this exhibitor's very important matter.

From the Zollverein we find one axhibitar of fire-clay portant purposes for which such atemils are required.

American plumbagu, and are not in other respects re-

markable. To Messrs, C. E. and F. Aanolin, of Elgersburg, in the Duchy of Saxe Gotha (Prussia, 778, p. 1093), Honour-able Mention is awarded for a considerable variety of chemical apparatus in earthenware exhibited by them. and of very good quality. The principal objects here to be noticed are the crucibles, which are of four sorts, but there are also retorts, alembics, and distilling apparatus,

besides other articles Mr. E. Mancu, of Berlin (Prussia, 240, p. 1061), has been already mentioned for his terra-cottas, but he is also an Exhibitor of elemical apparatus of good quality, the principal articles being two large and fine jurs for distilling acid. In France we have Mr. Boxxer, jnn. (1026, p.1231), exhibiting a muffle and various chemical apparatus, coosidered deserving of Honourable Mention, the muffles being constructed in parts to avoid fracture by heating; and there are also some very neatly-constructed crucibles, and other apparatus, exhibited by Mr. Devices (France, 476, p. 1200), which appear to be of very good quality. We find exhibited in Class I. (118, p. 153), a number of melting-pots made for easting brass, and other metals, by

Mr. S. Axster. These have been in us for some time, and are made by a patented process. They are recognised as of good quality in all respects.

O. GLAZED FIRE-CLAY GOODS. There are several Exhibitors of glazed fire-clay goods, some of them nearly approximating the manufacture of porcelain, but the articles are considered to belong to the personal one the articles are consumered to belong to the present division of clay manufactures. One of the chief of these is the firm of Messes, S. Gruzza and Co. (123, pp. 775-6), to whom a Prize Medal has been awarded in mother Clas (Class XXV.), but whose salt-glazed ware

demands notice here. This ware is of various qualities, according to the purpose for which it is required, some ubjects, as ginger-beer bottles, jars, &c., being comparatively coarse, while for chemical utensils it is impossible that too much care can be taken, or too much labour and ingenuity devoted to insore accuracy of form and uniformity of texture. For the principal part of the manufacture the clay is mixed, monlded, and dried, as for other pottery ware, but it is burnt in a room which admits of a degree of beat being applied which would melt any clays, unless of the finest natural quality, or very carefully prepared. In addition also to this high degree of firing, the glaze, instead of being applied by dipping, as is usual with cartheoware, is produced by throwing into the furnace, at a certain stage of the process, a quantity of coarse salt, which is instantly vapourised by the intense heat, and this vapour, penetrating to every part of the kiln, produces decomposition where it touches the vessels that are being baked; a film of glass being formed by the combination of a portion of the silica of the elay surface with the soda, while any iron that exists is brought to the surface, becomes oxidized, and gives a tint of colour apparently also adding to the strength of the glaze,

Among the objects thus produced, the exhibitors to whom we have already referred, Messrs. S. Green and Co., have manufactured some of the finest and largest that have been brought into the market; but Messra. DOULTON and Co., and DOULTON and WATTS, have also sent admirable specimens of great practical utility. Nu-merous examples are exhibited, both in Class XXVII. and outside the Building, in the North Western Enclosure. The Jory have especially noticed a group of objects by Messrs. Doulton and Co., including pipes of unusual size, and chemical vessels also of large size and extremely perfect; besides a series exhibited by Messrs. Sixoza, remarkable for being glazed inside only, the body vitri-fied as usual, and the surface of the ware being dry or unglazed. The advantage of the latter condition is considered to be the less probability of eracking, on the application of heat from the outer surface expanding more readily than if salt-glazed in the usual way. All the Prize Medals; and although the manufactures in this apparatus.

kind of material are in no degree less important than others already described in some detail, we can only here refer to them without announcing any further reward. It may, however, safely be said, that the objects exhi-bited on the English side in glazed stoneware, are worthy of great commendation for their excellence, and not less so for their great ntility.*

Mr. Ruffond (89, p. 770) has received Honourable Mention for an ingenious porcelain bath in one piece, two wash-tobs, and several glazed bricks, the former presenting a white glaze upon fire-clay, and being remarkable for its novelty and chespness. The present exhibitor invented his process for making such baths at the instance of the Society of Arts in the season of 1846-7. The

following account has been forwarded to the Reporter :-"The stone materials for this purpose, viz., fire-clay, China clay, and the glaze, are so assimilated that the two clays are of the same porosity, bear the same heat, expand and contract alike, and the glaze will melt only when the fire-clay is sufficiently burnt. They undergo venty-two hours of white best, are not sufficiently fired until cold-blast cast-iroo will melt, and they are produced iu the glazed finished state at one burning

In this state they can be ent with a chisel, are perfeetly non-absorbent, and are not affected by heat, cold, or damp. The full-sized adult bath costs, if perfectly free from blemish, 7l. First class, such as exhibited, 5/. His., or 5s. extra if marbled. Second class, colours not clear but body sound, 35s. to 60s. The glaxed The glazed white bricks are 13s, 6d, per bundred, and are found to stand well.

Mr. E. Underers, of Hirschberg, in Silesia (Prassia, 241, p. 1061), exhibits a set of water-pipes in glazed stoneware of very excellent quality, and is Houourably

Meetioned by the Jury.

Messrs. Salt and Mean, of East Liverpool, Ohio (United States, 203, p. 1450), exhibit a water-vase of somewhat remarkable appearance and good material, and are also Hononrably Meetioned.

Miscellanea.

There are two exhibitors in a material which, as it consists of porcelain, might be referred to Class XXV., but which, being widely disconnected in its application from the ordinary uses of that material, and being fin-cluded in Class XXVII., have been considered by this Jury. One of them presents an adaptation of porcelain for architectoral decoration, and the other for street labels, and we can say only a few words concerning each of them

of them.

To Messrs. Bowers, Chalston, and Woolischoff, of Thustall, in the Staffordsbire Potteries (104, p. 772), a Prize Medal has been awarded for a newly-patented

• Although by the decision of the constituted authorities the Motal which had been exerted to Mewers, 8c rece and Co. 10 Class XXVIII, has been withdrawn in favour of the similar boson's awarded by the dary of Class XXVII, the histories without giving common account of the objects which believe without giving comm account of the objects which believe without giving comm account of the objects which believe without giving comm account of the objects which believe without giving comm account of the objects which believe without giving common account of the objects which believe without private properties of the objects which believe without private properties of the strength of the objects which we have been accounted by the common account of the objects which we have been accounted by the common account of the objects which we have been accounted by the common account of the objects which we have been accounted by the common account of the objects which we have been accounted by the common account of the objects which we have been accounted by the common account of the objects which we have been accounted by the objects which we have been account

apparatus of the retort placed outside.

Of these the jar is stated to have a capacity of 420 gallons; and although not without flaws near the base, is gallons; and so much larger of comes and are detailed to a train a comparity of a significant of the common and a signific application of coloured and moulded porcelain for architectural decoration, capable of being carried cut to great extent, and especially adapted for door-cases and great carried and especially adapted for door-cases and not cornices for abop-fronts, &c. The material is cheap, brilliant in colour, sharp, and perfectly durable. Some of the decorations exhibited are very elegant, but they admit of great improvement, for which the material is

well adapted.

A Prize Medal has also been awarded to Mesors.

Sainnen and Whaller (121, p. 774) for a vitrous marble paste in a kind of porcelain, extremely hard and durable, and better adapted for street labels than anything

hitherto introduced.

Mr. J. Hassasse (131, p. 776) has exhibited a small collection of pigs, pitcher, &c., in stone-ware, which, althouspel of pigs, pitcher, &c., in stone-ware, which, althouspel of pigs, pitcher, &c., in stone properly belong to Class XXVI, and this is the case also properly belong to Class XXVI, and this is the case also properly when we remain an accordance of the control of the

A porcelain stove is exhibited from Frankforf (16, p. 1121), by Mr. J. Horyaxa, and other similar objects are elsewhere in the Building. Some articles in porcelain are elsewhere in the Building. Some articles in porcelain the Jury of Class XXV. Soch are those sent by Mr. Gitar. (France, 884, p. 1220), Mesers, Mixrox (p. 770), and Mr. J. G. Dawnox (Class XXII, 476, p. 484), all of whom are exhibitors of chimneypleses constructed procedula. The two former are noticed in Class XXV.

Mesers. Mayo and Co., of Chuopide, Lendon, are exhittors of a new kind of joint patented by them, and intended to connect glass pipes conveying gases or fluids (Class 1, 18, p. 122; and also of parent siphon vasce for containing advinced mineral waters (Class XXVIII., 7); p. 122; and also of parent siphon vasce for containing advinced mineral waters (Class XXVIII., 7); p. 122; and also of parent siphon vasce for containing advinced by the complex containing the conta

by expertence.

To Mr. E. J. COATER, of Bread Street (Class XXVII.,
18, 19, p. 765), a Prize Medal is awarded for a cheap
and useful combination of iron and glass in the construction of mantelpinces. These are very inexpensive, have
a good effect, and are extremely durable, and are said to
have been extensively introduced in the United States,

although new in England.

A new style of glating greenhouses and other constructions in glass has been exhibited by Mr. Karre, of Chichester (Outside West, 52, and Class XXVII, 192, p. 714), and is Honourshly Mentioned by the Jury. In this method vulcanized Indian rabber is introduced, and the glass is fastened without putty.

Another construction has been exhibited by Mr. Dencer (Ontside West, 61, p. 117), of something of the same kind, and is also Honourably Mentioned.

kind, and is also Honourably Mentioned.

Mr. Ltracoune (Class XXVII., 49, p. 767) is the exhibitor of several small drawing-room fountains, showing some ingenuity and elegance. There is, however,

influing very new produced in the contraction.

New Y. Haars, of New York (America, 283, 2), 1431,

APPENDIX.

EXPERIMENTS ON THE STRENGTH OF PORTLAND CEMENT.

Two exhibition of Pertinal cement on a large scale, seens. J. B. Warre and Sox, of Villenda, and Weers. Homes, America, and Co., of Creat Scotland Fard, to toda News, J. B. Warre and Sox, of Creat Scotland Fard, to toda the Jury their visit to illustrate the strength of their cement as compaced with other kinds, and accordingly to a total control of the compact of the control of the party of the control of the control of the control of the party of the control of the control of the control of the party of the control of the control of the control of the former septements were performed on the 24th September. An other septements were performed on the 24th September in the 24th September in the processor of Sect. Pushey and some other control of the control of which, attended by them, will also be given.

The first experiments were performed by Messrs, White and Co, and were intended to show the relative strength of Portland and Bonan cements. The weights used throughout were iron pigs, estimated at 100 lbs. each.

1. A block of neat Portland eement, 16 inches lung, and having a sectional area of 16 inches (4 inches square,) was suspended from each cad, and the weight applied exactly in the centre. The block had been made four months. It brock at 1,380 lbs, including the weight of the scale (estimated at 80 lbs.). The fracture was perpendicular, even, and good.

2. An exactly similar block of neat Roman cement, made from Harwich stone, and seven weeks old, broke at 380 lbs. This must have been a bad sample of the material.

 A similar block of nest Sheppey cement, made in the month of May, hroks at 980 lbs.
 A block of nest Portland cement, having a sectional area, measuring 24 inches by 2 inches, made 31st March, was pulled anuder with the fracture as shown in the top,

at 2,280 lbs.

5. A block of Portland stone, having the same sectional area, and in all respects resembling the above, broke at 1,480 lbs. The fracture showed no flaw in the stone,

the visit home eneme, the thickness of the joint being the visit home enement, the thickness of the joint being the visit home enement, the thickness of the joint being the visit has been partly on the polyment of the visit has been partly to the lower surface, as showing, that the adhesive force of the ceasent was greater than the coolesion. It was estimated that Rouns cement, a under such circumstances, would separate at under 1,1000 be.

8. Five hard stock bricks were taken, cemented together with a mixture consisting of one-half Portland cement and one-half sand. They were suspended from the upper brick, and the scale was attached to the lower. The fracture took place at 2,580 lbs. at the top

brick.

9. The principal experiment of Messrs, White consisted in breaking down a beam constructed of ten courses of hollow bricks cemented together, the apper part having three courses on edge and four flatwise, and the lower part two courses on edge and one flatwise. They were fastened with Portland coment, and strengtiuened by learning of the properties of the proper

fifteen, were juscreed. The iron measured 13 inch hy ith nearly. The following are the dimentithe beam:-

and fastened with Roman cement and sand, the net weight of the beam, including scale and stone, would have been 21,207 lbs., being a difference of 5,743 lbs. resulting from the use of hollow hricks. On the other hand it appears that the actual area of

cemented surface is only 700 square inches instead of 1,060, which it would have been if solid bricks had been employed; for it appears that the actual sectional area of the bricks is 5] by 4] inches, the rims or sides being Iths inch, so that the hollow part may be estimated at 9 square There are in all forty vacuities, and we thus inches. have-

Six uppermost courses, measuring 36×17-25= 621 In sectional area Three lower courses, measuring in $16 \times 26 \cdot 6 = 433$ Dednet spaces = 40 × 9 - - -= 360 Total sectional area cemented -700

Inches. Sq. Inches

The depth of the beam being $52\frac{1}{2}$ inches, we thus have, as a measure of the strength of the beam, $700 \times 52\frac{1}{2} =$

One object in the peculiar form and proportions of this beam was to institute a comparison between the strength of Roman and Portland cement, a similar beam having been constructed in 1837 at Nine Elms, by Messrs, Francis and White, at the suggestion of Mr. Brunel, the bricks in which were, however, common stock bricks, bonded in the usual manner, and bedded and grouted with a mixture of equal parts of the best Roman cement and elean Thomes sand. In this beam there were nineteen courses, the thirteen uppermost being two bricks thick, and the six lower ones two and n-half; the sectional area being 1,107 superficial inches, and there were inserted fifteen lengths of hoop iron 14 inch by 4th. The beam was borne on two pieces, leaving a clear bearing of 21 feet 4 inches; and after it had been hailt about three months it was loaded with 11,200 lbs. of pig-iron, placed on a platform suspended from the central part of the beam. At the end of another three months the weight was At the end of another three months the weight was increased to $24,000 \, lb$. After tweek months it was broken down by increasing the weight to $50,622 \, lb$ s. The depth of this beam being 57 inches, the measure of its strength compared with that of the other is $1,107 \times 57 = 63,099$; and since 63,099 : 36,750 : 50,652.

29,500, it is considered by the exhibitors that the breaking weight of their beam, if in Portland cement, ought to have been 29,500 lbs.

The heam, as originally constructed on the south side of the Euclosure ontside the western extremity of the Exhibition, was completed in April last, and has since been left unsupported, carrying 17,464 lbs., as before explained, consisting of the full weight of the beam itself, the stone, and the senie, until the 20th September. On 5. Another beam of twenty-two bricks, also fixed at that day it was loaded in the centre part with 15,000 lbs. one extremity (only the number free being reckoned),

weight of pig-iron, and in this state was left till Monday. when it was carefully examined, and found free from any flaw. The loading was then continued until it was weighted with 40,000 lbs., when a defection of nearly one-eighth of an inch was observed. Shortly afterwards, at 41,600 lbs., two cracks were detected, commencing on each side at the fourth brick from the centre, and before long a third erack exactly in the centre. One of these cracks commenced with the fracture of a brick, but the other two at the contact of the cement with bricks. When another 10,000 lbs. had been added, the iron hoop was heard to crack, and the piers were slightly affected, as was proved by the breaking of a string that had been stretched from one end to the other to measure the deflec-With this weight also the eracks extended through the six lower courses, and the deflection was about fiveon up to 62,800 lbs., this weight was borne for a short time, but the fissures all widened manifestly; the central one extended vertically through bricks and cement indifferently, and the beam at length separated into two parts, thrusting the piers considerably out of the upright.

After the conclusion of the experiment it was found, that of the iron boop there were only thirteen pieces traceable, and of these ten were torn asunder at the principal central crack; the other three were doubtless broken also, but at the side fissures. The important part played by the iron in this case must not be overlooked, but cannot very easily be estimated. As a practical proof, however, of the use of hrick heams and their strength, this experiment is of considerable value in itself, besides affording an additional proof of the value of Portland

The true comparative strength of Roman and Portland cement is, perhaps, not so well tested as if the bricks had been of the same kind in the two experiments; but estimating as nearly as circumstances will admit, it appears that the Portland bears to the Roman a ratio of 21 to 1 very nearly. It must, however, be remembered that the Roman cement beam had been built seventeen months, und the Portland only five, a fact greatly in favour of the former material.

The experiments of Messrs, Robins and Aspdin were of somewhat similar nature, but cannot be regarded either as identical or parallel. They were made on various mixtures of Portland coment, some of them joining together bricks and stone, and others formed into slabs of various dimensions. There was no experiment on so large n scale as the brick beam of Messrs. White, but the other specimens were, on the whole, larger, and the illustrations were of great interest. We proceed to enumerate them

1. A block of the shape of that shown in Experiment 1. A block of the shape of that shown in Experiment 4, of Measts. White, but consisting of three parts of sand and one of Purtland cement, and having a sectional area of 4 inches by 21 inches (= 8° 5 square inches) was supended from a clip, and held a scale weighing about 1 cwt. The block had been usade about one mouth. I broke at 1. 2,400 lbs., including scale, the fracture resembling that in the other case, but a part of the cement being broken off hy the clip.

2. A similar block, having a sectional area of 31 by 21 inches, and made with four parts sand and one part Portland ecment, broke with 2,500 lbs., including scale. The fracture was clean, and at the lower part of the neck, The texture of the cement was even. 3. A beam of sixteen common stock bricks, juined by

very thick jutervals of real Portland cement, was held at the extremities, and broke by a weight of 500 lbs. suspended from the middle. In this case the part broken was the hrick only. The beam had been made one month. 4. A similar beam of the same magnitude, but having one end only supported, and projecting 3 feet 24 inches from the bearing point, was weighted, and broke with 256 lbs., exclusive of the scale suspended from the free extremity. In this case the fracture took place at the eleventh brick from the fixed extremity, and both brick and cement were fractured.

was broken by 11 cwt., in addition to the scale.

length of this beam was 51 inches, 6. A solid step, constructed of two parts Portland cement and one part hoken brick, and weighing 34 cwt., was fixed at one extremity, leaving 6 feet 44 inches projecting. It supported its own weight, and broke off close to the bearing point, when the third weight of 56 lbs. (making a total of 168 lbs.), was placed on the extreme end.

 Two blocks of neat cement, 1 foot 5½ inches long,
 inches wide, and 4½ inches thick, cemented together with next cement, broke at 6,000 lbs. The lower part of the block gave way

 Twenty stock bricks in courses, united with cement, composed of one of cement and one of sand, 3 feet 64 inches bearing, the ends supported by iron clamps, and the weight applied to the centre. The bricks broke 9. Six fire-bricks in courses, joints all cement. The

upper brick broke at 2,836 lbs. 10. The five fire-bricks from the last trial were ngain

tested, the iron being inserted in the second brick from each end. The upper brick broke, carrying with it also each end. The upper brick broke, c a part of the lower weight, 4,600 lbs.

11. Two pieces of Portland stone, 2 feet by 11½ inches, 7½ inches thick, neat cement joints. The lower stone broke, carrying away a very small portion of the cement joint; weight 7,272 lbs.

The last five experiments (Nos. 7 to 11) were performed on the 23rd September, in the presence of General Sir Charles Pasley, C.B., Professor Wappler, of Vienna, and other scientific gentlemen, by the two former of whom the

above statement is attested.

tion. They cannot fail to be regarded with much interest by every one connected with engineering and the arts of construction, and, combined with what was before known on the subject, they fully prove the value of the peculiar material known as Portland cement, and its great advantage over the Roman or Parker's cement. There can be little doubt that the mud of many rivers running over soft calcareous rock, and containing also a large per centage of clay, might be used with advantage, as well as the mud of the Medway; but it yet remains to determine the man of the Medway; but it yet remains to determine the true chemical cause of the great difference observable in similar proportions of calcareous and argillaceous matter for the purposes of cement, and till this is done, it can hardly be expected that artificial cements will exactly replace those which occur naturally, and whose value has

been proved by experience. Although it did not form one of the subjects of the experiments instituted before the Jury to prove the resistance of Portland cement to crushing weights, it may not be out of place to add here the results of experiments on this subject

A block of neat Portland cement, manufactured by Messrs. Robins, Aspdin, and Co., thirty days old, measuring 18 inches × 9 × 9, was tested by a Bramah's hydrostatic press, and is said to have withstood a pressure of 41 tons for nowards of a minute, when it broke up with n report.

A similar block, of one part cement and one sand, twenty-eight days old, crushed at 108 tous. Auotier, four sand and one cement, at 45 tons; and another, nine sand and one cement, crushed at 41 tons. A small piece of neat Portland cement, exposing a sur-

face of 14 inch by 1 inch, and six months old, withstood The Jury have great satisfaction in placing these ex-periments on record as among the results of the Exhibi-of the same size crushed at 2,576 lbs.

London, October 1851.

T. A. Wist, M.D., 9 Prince's Gate, Hyde Park; Hon, East India Company.

Associate NATALIS RONDOT, I Rue Fontaine, St. George's, Paris; Late of the Embassy to China, &c., &c. (Jurer, Class XXVI.)

In commencing their labours, the Jury thought it advi-sable to divide themselves into Sub-Committees for the purpose of examining the various objects submitted to their attention. The subdivisions of the Class enabled them to do this with facility, and the following Sub-Juries were formed:-

The Chairman, Don Joaquin Alfonso, M. Balard, and Dr. LANKESTER for Sections A and B, including gutta percha and caoutchone manufactures Messrs. Gaav, Annorr, and Wise for Sections B and C, including manufactures from various animal substance

as ivory, tortoiseshell, horn, &e.; and from vegetable substaoces, as wood, vegetable ivory, cork, &c. Messrs, MILLER and PETERSON for Sections E and F. embracing manufactures of straw, and of a miscellane

kind from various animal and vegetable substances, Dr. Lankester and Dr. Wisk were appointed to draw up the present Report. The avocations of the latter gen-tleman having called him from town, the drawing up of the Report devolved on Dr. Lankester. Each of the Sub-Juries was requested to farnish the Reporter with remarks upon the various objects in their Sections; and the Re-porter is indebted for a large proportion of the general remarks on the manufacturer in caontchone and gutta

percha to M. BALARD The constitution of this Class is somewhat peculiar and exceptional. The necessity for its existence was felt in the fact that a large number of articles manufactured from vegetable and animal substances could not properly be included in the Classes which embraced either wove or felted materials. This was especially the case with the very numerous applications of enontehoue and gutta pereha to the production of articles of constant and in-creasing use. What is true generally of these substances was felt in relation to many things manufactured from such animal substances ar form, ivory, whilebone, &c., and the vegetable substances-cork, vegetable ivery, and cocoa-nat fibres. At the same time the Jury experienced some difficulty in defining what articles rightly belonged to their Class without trenching apon the domain of others. This difficulty had evidently been felt in the disposal in the Building of many of the objects exhibited, pown in the isiniting of many or the objects exhibited, and one of their first tasks was to send to other Classes objects which bad been placed in Class XXVIII., and which had appeared noder this head in the Official Catalogue. They had also to examine other Classes for the

purpose of bringing objects into their own Class, which otherwise might have been overlooked. With all the other precautions taken by the Jury, it is to be feared that some objects properly belonging to their Class, from being placed in other Classes, or from not being in the Catalogue, have not received the attention they deserved. Especially have they felt that many articles exhibited in the Foreign Department, from being sent to the Exhibition after the awards were made, may have escaped the notice which their merits would otherwise have demanded

In presenting this Report, the Reporter has adopted the plan laid down in the scheme of "Heads for Juries," published by the Royal Commission, each Section of the Class, where necessary, being treated of under the following heads:—1. General Remarks, 2. Council Medals, 3. Prize Medals, 4. Honourable Mentions, 5, Remaining Exhibitors,

SECTION A,-MANUFACTURES FROM CAOUTCHOUG.

§ 1. General Remarks. The existence of a milky jnice in many plants, which flows from them when their tissues are wounded, is a fact that has been familiarly known from time immemorial. It is, however, only a matter of recent discovery that this milky juice characterizes certain families of plants. Although the great majority of plants which yield this juice in ahandance are tropical, yet they are not without their Earopean representatives. The spurges, dandelion, and celandine of our road-sides are instances. The families of plants which furnish this milky juice in the greatest abundance are Moracea, Euphorbiacea, Arto-carpea, Apocyaucea, Cichoracea, Papaveracea, Campa-nulacea, and Lobeliacea.

naturear, and Lobelineer.

This jaice, which is called by botanists "the milky juice," because it has an appearance similar to milk, has also the physical constitution of that fluid. It is an aqueous liquid, charged with soluble matter, in which float globules of a substance insoluble is water, and which are by their tensity held in suspension in the liquid, but for which the milky liquid, but for the contract of the contract for which they have no affinity, in the same manner as butter is held in suspension by milk. From the difference of the refractive powers of these two substances, each of which, taken separately, would be colourless or trans-parent, arise the opacity and white colour of the two; hence the compound is properly called a "milky juice.

The analogies which this juice exhibits with the milk of animals and equetable embloss are seen in the manner in which it acts when left to itself. Run out into the air, received and preserved in close vessels, it separates itself into two layers, as milk itself would do. The watery part very soon has an insoluble part floating upon it, which collects together, and swims at the top as cream wirms upon milk, and which forms nearly the half of the

But with these physical resemblances the analogies cause. That which in milk and in enulsions produced from seeds collects on the surface of the aqueous liquor, in properly speaking, a fairty body, containing oxygen in its composition, as they all do; while the kind of cream which avies non the milky jujec of the plants when the surface of the plants when the produced of the plant when the produced of the plant when the produced of the plants when the produced of the plants when the produced of the plants when the produced of the produced of the plants when the produced of the plants when the plants when the produced of the plants when the plants

lead precil marks, it acquired the name of Indiscrebber.
Although, after its upplication to the water-pooling of garmens, its commission gradually increased, the sinon the property of the property of the property of the import of this article had increased to between 100,000 and 800,000 pounds. In 1842 the import of this article had increased to between 100,000 and 800,000 pounds. Up to the present time the conone port alone in South America is said now to send to Green Britain nearly 4,000 exts amountly. To the large consumption in the United Kingdorf we obtain him to be a send of the contract
country. The particular species of plants which are employed for procuring India-rubber are very numerous, and it is probable that many yield it which are not yet known to botanists. The tree which supplies most in Continental India is the Ficus elastica, a tree belonging to the order Moracese; it is exceedingly abundant in Assam. All the apecies of ficus yield caoutchouc to a greater or less extent in their juices, and even the common fig (Ficus carica) of Europe contains it. Species of ficus produce the caour-chone brought from Java, and F. radula, F. elliptica, and F. princides are amongst those mentioned as affording and P. principles are amongst those mentioned as anorthing an portion of that brought from America. Next to the Moracor, the order Euphorbiacor yields the largest quantity of caoutehoue. The Siphonia closiva, plant found in Guiana, Brazil, and extending over a large district of Central America, yields the best kinds of India-rubber that are brought into the markets of Europe and America. To another order, Appeysancer, we are indebted for the exemthous which is brought from the islands of the Indian Archipelago. The plant which is the source of this substance in those districts is the Urccola clustica, a climbing plant of very rapid growth and gigantic dimen-sions. A single tree is said to yield, by tapping, from 50 to 60 lbs, annually. Many other plants of this order yield countchone, and of those given on good authority we may mention Collophora utilis and Cameraria latifolia, plants of South America; Vahea gassnifera, in Mada-gascar; and Willinghbeia edulis in the East Indies. To this order belongs the cow-tree, or Hya hya (Tubernamontana wills), of tropical America, which yields a milky juice that is drunk by the natives of the district in which it grows.

The caoutchoue, whilst it is in the tissues of the plant,

The connectione, whilst it is in the tissues of the plant, apparatus, these foreign matters, crushed by the mill, are is evidently in a fluid condition, but after its separation carried off by degrees, and the purified portions of canonic from the other fluid parts, its consistence becomes changed, chose unite the one with the other. By the subsequent

and it forms a solid mass similiar, in its external character, to vegetable albumen. In this state it is deuse and hard, but may be separated and rolled ont so as to form a sheet resembling leather. It has many interesting and peculiar properties. Insoluble in water and in alcohol, it dissolves in ether, in the sulphuret of carbon, the fat olds, and the liquid carburets of hydrogen.

It is off and classic at the ordinary temperature, but at the temperature of g² above the freezing point it acquires the hardness of wood. A temperature of 100 'softens it without altering its form. It then unites with itself with the greatest facility, and two pieces recently cut spart remains on so to moder it impossible to discover where the remains of the properature, and the state of the control of the properlying to the piece. The fair fight response to properlying, does not recover the primitive prowhich, on cooling, does not recover the primitive pro-

perties of caontehone.

In this store of recent coagulation, and while still in a pulpy condition, caoutehoue possesses in degree of plasticity which admits of its receiving, by means of moulds, the most varied forms.

The prince part of the constitution of commerce, in obtained by the mixer of the countries in which it is preduced, in the form of shapeless masses, collected at purpose of extracting the pince from its condition in a purpose of extracting the pince from its condition in a trucked made in the earth, and compilated in this rade to the pince of the condition of the control of the control of the pince of the control of the control of the trucked as large truck. A part of it, lowever, possesses other forms, which the rules are of the natives attempts of the commerce of the control of the control of the shaped bodies, and there dipped in the modula in the shaped bodies, and these dipped in the modula of the shaped bodies, and these dipped in the modula of the shaped bodies, and these dipped in the modula of the shaped bodies, and these dipped in the modula of the shaped bodies, and these dipped in the modula of the shaped bodies, and these dipped in the modula of the shaped bodies, and these dipped in the modula of the shaped bodies, by tracking the modula and perting it cut in frequent to the shaped bodies and the shaped bodies and the shaped bodies. It is shaped to be shaped bodies and the shaped bodies are shaped by the shaped bodies and the shaped bodies and the shaped bodies and the shaped bodies are shaped by the shaped bodies and the shaped bodies are shaped by the shaped by the shaped bodies and the shaped bodies are shaped by the shaped bodies and the shaped by the shaped of the shaped by the shap

Caoutehoue is obtained from both the Old and New World. The East Indies furnish caoutchone, of which numerons specimens have been exhibited in the Crystal Palace by the East India Company. This caoutchouc, which comes principally from Java, is often glutinous, and is less esteemed in commerce than that furnished by the equatorial regions of America. Great quantities of caoutchout are imported into Europe from Mexico, from South America, and especially from the province of Para, in Brazil. That which comes in the shape of bottles is generally preferred, and when it is pure, and the different coats which comprise it are well united, it may be employed immediately for many purposes. But it often happens that the coats which form the pear-shaped masses are badly united. It then becomes necessary, in order to make use of them, to work it up hy a process of kneading, so as to obtain it in a coherent or homogeneous mass. This operation becomes especially indispensable when, as most commonly happens, the caontchouc is in large impure masses, and mixed with sand and the debris of vegetable matter. These impurities do not antirely proceed from the moulds made in the earth, into which the inice has been allowed to exude, and in which it has been nice has been allowed to exude, and in which it has been left to thicken and solidify, but their quantity and their presence between the coats of the pyriform masses show that the impority is mainly to be stributed to fraud. The exoutchour thus obtained is not applicable to any use nutil it has undergone a previous purification.

The parification of the caustreleno is accomplished by substituting the impure caustreleno to the action of rylinders farmished with teeth turning in opposite directions and of massication. If the matter which renders the canotichone impure adheres very closely when dry, this protaining the control of the degrees, and the purified portions of canotic control of the degrees, and the purified portions of canotic conexposure of these masses of purified caoutchoic to a second massication, but performed dry, they are softened by the heat evolved during the forcible compression to which they are then submitted. In this treatment the enouchous becomes softened without being liquified, and a bomogeneous mass is formed which is cut in the form of rectangular blocks.

These are again placed in casting monlds, in which they are powerfully compressed, until they are empletely cooled, when it is found that the pressare has freed them from cavities, air-bubbles, &c. By submitting them to the action of knives moved very rapidly by a mechanical action, and the edges of which are constantly kept wet by a thin jet of water, the caoutehout is eut into sheets of various thicknesses, which, subdivided in their turn, constitute those small parallelopipedons used by draughtsmen

to rub out the marks of black-lend pencils This use of caoutchook was, in England, for a long time the only one to which it was applied; but this limited use was far from indicating the extent to which enoutthe multiplicity of services it has been called upon to perform for sanatory and industrial purposes. To rub out peacil marks, to form the rude slippers which seemed well adapted to the Indian toilet, but to which a form acceptable in Europe had not been imparted, were, in fact, the only uses to which caoutehoue was applied up to 1820. In England was discovered the art of strytching 1820. In England was discovered the art of stryching it into thin sheets, and thus making it available for the production of waterproof fabries. In France was discarcred the art of drawing it out into delicate threads for the manufacture of elastic tissues. We are indebted to Messes, Mackintosh and Ilancock for the application of caoutchoue to the rendering tissues waterproof, and for the manufacture of those gurments which throughout the world have rendered unquestioned service to the cause of health, and have made the name of one of their inventors

so justly popular. The garments called Mackintoshes are well known. They are formed of fabrics covered on one side with caontehoue, or two fabrics are united by the countehoue between. They are thus rendered impermeable to water, but at the same time they possess a flexibility such as it had never been possible to obtain by the employment of other varnishes. For the purpose of obtaining the sheet of caoutehoue sufficiently thin for this purpose, it is dissolved. The solid carburets of hydrogen are soluble in the liquid carburets, and for this purpose spirits of turpentine and the volatile products of coal tar were first employed. But after having obtained this solution, it was necessary to evaporate a great quantity of it for the purpose of obtaining a coating of caoutehoue, which at first occupying a great space, should be reduced to a small one when the drying was complete. For the purpose, howknending the caoutchoue, by means of powerful machines, with the spirit of turpentine or naphtha, and impregnating it with the menstrua without dissolving it, and softening it without making it a liquid; the caoutehoue rendered pulpy, is then spread upon the cloths by means of a flattening mill, and the process of evaporation is thus dispensed with. Waterproof garments were thus rendered cheap and available for the use of every class. description of garment, nevertheless, presented a notable fault which was not avoided until a later period, and which arose out of the properties inherent in the enoutchoue itself. This substance, which in ordinary circumstances possesses very great clasticity, such as to justify the name by which it is designated in France, gomes elastique (clastie gum), loses this elasticity when exposed to a temperature near the freezing point of water, and this suppleness, which might almost cause a sheet of enoutchoue to be mistaken for an animal membrane, gives place all at once to the rigidity exhibited by the same membrane when dried. This property, which is cold weather was a real defect, when applied to fabrics ren-dered waterproof by caontehoue, has been found very useful in the making of garders, braces, and other articles cold rendered them very inconvenient. However, Mr. in which the clusticity of the caontchingc has been brought [Goodyear at last succeeded in making abose of raw Indianous supersed that which had, notill then, been obtained by "mibber purified," and perfectly free from objection, thus

the employment of spiral metallic springs. In order to obtain the threads which are used for the manufacture of clastic tissues, either the flasks of caoutchoue in its natural state, out in half and flattened by pressure, or else those masses of purified enoutchone which are sold in continuous slicets, out by knives, wetted by a small jet of water, are employed. These sheets are divided into thongs; the latter are afterwards subdivided into very narrow bands, which serve in their turn to produce the threads employed for the manufacture of the tissues. If hy a slight elevation of temperature the natural elasticity of the caoutehous is increased, these narrow bands can then be stretched is increased, these marrow ands can then be stretched into threads of great length by drawing them out and rolling them upon bobbins. But it may be well conceived that the management and wearing of the threads would be very difficult if they retained their elasticity. Fortunately the partieles of the constitution eventually accommately the partieles. modate thenselves to the forced position which they have been made to assume, and the exposure to a low temperature materially hastens this result. The threads having thus lost their elasticity can then be introduced like common threads into the fabrication of stuffs; they can be covered with a different thread, by winding spirally round them cotton, silk, &c., and this compound thread may be in its turn introduced into the composition of new tissues. In all these operations the enoutehout has retained all its rigidity, but that clasticity of which it has been deprived by a long distension and a low temperature, can be restored to it by means of a proper degree of heat, The stuff thus woven is exposed to a temperature of from 140' to 160 Fahrenbeit by the passage of a bot iron, when each thread resumes with its primitive length the diameter which it first possessed. The fabric diminishes in length without increasing in width. The tissue is thus compressed, and the caouteboue, which has regained its elasticity, communicates it in a permanent manner to these tissues. The manufucture of these threads of caoutchouc constitutes at present a distinct branch of industry from that which, making use of them either in an uncovered state, or covered with silk and cotton, combines them with ardinary threads in the way of weaving; and, like the manufacturers of linen or cotton fabrics, the makers of the elastic tissues buy the threads of enontchance in bulking of different numbers. When the limited lengths of the narrow bands from which these threads are manufactured is borne in mind, the necessity is foreseen of being able to unite them end to end for the purpose of making continuous threads. A remarkable property of cooutchoic renders this easy. It unites with itself with the greatest readiness if it be the least warm; and two surfaces recently cut with a very sharp instrument, may be made to adhere together by means of pressure, with a cohesion equal to that which unites the other parts of the same thread. But although in this case this property is made meful, in other instances the limited elasticity, and the rigidity communicated to it hy a low temperature, are great drawbacks.

However, all these properties inimical to its use disappear in that combination of sulphur with caoutehous called vulcanized India-ruhber, which exhibits such special properties as to form in some degree a new sub-stance. This transformation of caoutehoue was first

while in England the employment of caontebone was being developed principally in regard to the rendering of eloths waterproof, and in France its elasticity was being made available for the manufacture of certain tissues, it was turned to account in America for waterproof shoes, by making use of the processes discovered by Mr. Charles Goodyear, who, since 1836, had been engaged in the discovery of means for making use of enoutehoue, with a skill and perseverance which have borne the most happy fruits. It is not that attempts at fashioning according to the European taste, and thus rendering useful the Indian shoe made of caoutchouc, had not been frequently made in Europe, but these attempts had bardly been successful in giving them acceptable forms, and the stiffening by

completing by the manufacture of waterproof shoes the service which Mackintosh had begun by the invention of the garments which bear his name. Since 1842, Mr. Goodvear has imported into Europe shoes which possess an unlimited and permanent elasticity, and which resist cold; two of their surfaces may be pressed against each other without the least adhesion taking place. These are precisely the remarkable qualities which characterize that enoutehoue which is called in the present day vulcanized Indin-rabber. Impressed, perhaps, with the idea, too often moreover a just one, that the specification of a patent is sometimes nothing more than the occasion of attracting the attention of imitators, Mr. Goodyear took no patent for this article, but he endesvoured in Europe to take advantage of his discovery, by communicating it as a process of which he nlone possessed the secret, which might be lost to mankind and disappear with its sole possessor, when Mr. Thomas Hancock, of Stoke Newing-ton, who had been engaged in Europe in the working of enoutehone with no less perseverance and success than Mr. Goodyear in America, discovered anew the process of the vulcanization of India-rubber, and secured it by a patent, which Mr. Goodyear afterwards demanded for the same subject. Mr. Thomas Hancock discovered that a band of caontekone dipped into melted sulphur, and im-pregnated with this substance, without losing any of its properties, only required to be afterwards exposed to a temperature of about 300° Fahrenheit, to acquire properties entirely novel, which were precisely those possessed by the material employed by Mr. Goodyear for the waterproof shoes.

This was, as may be even, a new discovery of a five strong barrier and the strong strong strong and a strong known as board on the strong and a This discovery must, however, have presented in diffisallers, and repulsed also the furnitus cooperation of strong and the strong strong strong and a strong have pointed out to Mr. Blancock the existence of subject in the predictions of Mr. Goodyers, and these also dislabal deemed indispensable, it could not it may manner than the strong strong strong strong and the strong properties as due to the discovery of the confident condition in given temperature which also or and able to imput to the attractor of careful condition of a given temperature which also or and subject the expression of the attractor of careful condition of the strong strong and the strong conditions and the strong strong and the strong of careful conditions a given temperature which also or and subject the expressions.

Whatever may be the other of merit assigned to Mr. Goodyver and to Mr. Hamocok is this important invention, the latter has not the less exclusive merit of lawing discovered that subject may be received that subject may be received. The subject may be received that subject may be received the transmission of India-rubber. On seeing Mr. Charles Goodgreer of the price which he subsequently food not, it is felt that he regarded their intervention as indisponable, while it is now demonstrated that subject a fool is sufficient; if often substances are employed in certain crass, it is not so much the subsequently law of the consideration
The vulcanization of India-rubber is an easy process. The India-rubber, softened by the heat evolved when it is being kneaded by strong machines, is mixed with the sulphur in the masticating apparatus already alluded to. is mixture retnins all the solubility of the caoutchoug in the different menstrun,-the property of becoming hard at a low temperature as well as that of uniting with itself; but as soon as it is exposed to a temperature of 3000 Fahrenheit,—a temperature which would have sufficed to change the pure exontebooe,—the matter acquires new properties. It is no longer soluble in the meastrax which dissolve enoutehoue, but is impregnated with them by contact, and swells out like an animal membrane that is moistened with water; resuming its primitive properties on being dried. It no longer becomes rigid when exposed to cold, nor does it unite with itself, and it resists without any alteration a temperature which would have sufficed to transform the ordinary eaoutchough iato n sticky matter; it is, in short, vulcanized Indiarubber. This absence of the tendency to adhesian is so decided, that in actual manufacture no use whatever can be made of the shavings of the enoutehone thus modified.

and the means of separating the sulphur and reproducing the pure consolutione presents at the present day an important problem to solve. If this action of heat which modifies the consolutions is exceeded upon a mixture enclosed and compressed in a mould, the material then acquires a form which the indebnite and permanent clasticity of the volcasized Iudia-rubber causes it tu

retains.
This sulphurization of the India-rubber, instead of being produced with free sulphur, may be obtained with sulphur in a state of combination, as with the chloride of sulphur. If articles of common constitutions are immersed for one of the common constitution of the common constitut

is designated by the name of concreted constrience. has already become.

1. Cusatas Macaisvou and Ca., 7a Aldermalusy (76, pp. 784, 785). The firm of Clarites Mackinston had Ca comprises the names of the men who in Europe have made the most useful discoveries in the art of apply. Mackinston, who gave his own names to the waterpoof garnets, and Mr. Thomas Hancock, whose have of merit in the theoryty of the vulcanization of India-subber we of articles exhibited by this firm, the importance of the uses in which the substance is capable of being applied, expectably since the discovery of the process of vulcanization.

tion, can be readily appreciated.

The kinds of fabries with which the garments called Mackintoobse are manufactured have always remained the same, but the garments themselves have acquired more lightness and less smell, and the substitution of vulcainated for common coottchone insures to them at the present day a permanent suppleness.

The other services which these fabrics are called upon to perform, have been greatly multiplied. Their price having become levis, they are capable of being applied in line of targashings for overing waggons, carriages, &s. which was also as the service of the services of the services water, and which had at first been made available for a water, and which had at first been made available for a water, and which had at first been made rain properties one, has allowed of their being made into portable baths, which can be robled up like an Mesers. Merkshoth and Co. are made with much carr, and with a degree of degance which shows that in Europe these articles are but tiltie used except by the more op-

It is not only in the making of shoes that Indiarnables has been called in to supersels teather; the articles exhibited by Messrs. Mackintosh and Co. show the use that nhe made of it to form pistons of pumps, and how substituted for leather or metal ones. Sheets of count-chouse of different colours, either month or worked in relief, are brought in to supersede moulted ornaments in the manifacture of fermiture, of ottomans, and in the hinding substitute of the properties of the colours of the state of the st

The use of vulcanized India-rubber to form the pittonvalvesis steam-enjases on the serve principle, has greatly contributed to the employment of these novel motive powers, which are destined in some degree to effect a change in mavigation by allowing steam to come in solely as an auxiliary to the wind. The exhibition of Messrs, blackintosh and Co. comprises a valve of this description, which after as months we have undergone 20 see alter594

ation that it may be foreseen that these articles possess an almost unlimited durability. The rendering available the impermeability of their fabrics to air and gas has likewise been extended. To the air-custions which have been long used are now added the air-mattresses, so well adapted as beds for travellers and invalids; boats inflated with air, at once portable and incapable of sinking, and which for life-boat uses and in inland voyages are capable of rendering great service. The collection of Messrs, Mackintosh presents some specimens of this kind of great interest. Licut, Halkett, of the Royal Navy, by making them in several closed compartments in such a manner that the stuff being pierced through at one point cannot lead as a necessary consequence to the sinking of the bent, has rendered more certain the services which these machines are called upon to perform. The applications of the elasticity of enoutchone have also been greatly in creased. The wheels of carriages bave been surrounded by it in such a manner as to prevent the disagreeable noise which they make upon the pavement. Hollers for inking printing types and lithographic stones have been made from it; it is employed for the making of cushions for hilliard tables, and to supersede the use of suckingcords in bedsteads. Advantage has been taken of the clasticity of an India-rubber band, which has a tendency to return to its primitive length when the action of opening a door has clongated it, for the purpose of forming door-springs, the use of which is beginning to spread widely

The force with which caoutchone untwists itself, when it has been twisted, has caused it to be employed in the mechanism of window-blinds.

A thin tube of India-rubber, of tolerably large diameter,

haft flattende at the hottom, to that it terminates in two date edges, which the elasticity keep in just position, flat edges, which the elasticity keep in just position, feetly supersels eviliancy laydranic values. The elegewish clare in constant below oney but personate of inty which are in constant below oney but personate of inty below. The chalcidge of full-in-labels is made as ring of it applicable for unifug con-tens or earther indees one below. The chalcidge of full-in-labels is made as ring of it applicable for unifug con-tens or earther indees one below. The chalcidge of full-in-labels is made as ring of it applicable for unifug con-tens or earther indees one which is the contract of the contract of the contract of the pipes to able one within another, presents a method of the conveyages of water in large towns.

A thin hollow sphere of India-rubber, terminating in an appendage in the form of a tube, introduced in a theceld state into an opening arcidentally made in gas or water-pipes, may by means of being expanded by indiation, be used to press upon the sides of these pipes, and thus present a method of occlasion of great simplicity, which will allow these pipes, which it has become necessary to replace, to be removed without inconvenience.

Mr. Isoland Extract Hodger has lately proposed to make use of cond of voluntation Higherather as a messo of reudering its elasticity servicesible in raising weights, and has offered by the use of different cords, which are to be stretched necessively, and then released all at once, with increased force. This invention is any yet to use for any one to be able to judge of it by experiments on a large seale. The source of power in this application of ladia-rubber presents a curious physical problem, as it is in videatly only in the property of the control of the con-

mechanical sorce. The substitution of valcanized India-rubher for metallic springs in the buffers of locomotive-engines, is one of great service. The masses of vulcanized India-rubber deaden the shocks with an ease which may cause this employment of canntchout to be considered as one of the nost useful to which it has been applied up to the present day.

A certain number of the novel applications are due to Messay, Charles Mackinotsh and Co. The ability which they have displayed in the manufacture of canethone has afforded to other inventors of these new applications the measus of patting their ideas into practice. Without the discovery of vulcanized India-rubber they could, moreover, never have been carried out. The Jury, therefore, in order to recompense the considerable services rendered in the employment of caoutehous by Messay. Mackintosh, Hancock, and their other partners, have awarded a Council Medal to the firm of Charles Mackintosh tools and Co.

 CHARLES GOODYEAR, Newhaven, Connecticut, United States (378, p. 1461). Mr. Charles Goodyear, of Newhaven, Connecticut, exhibits a very remarkable collection of productions in caoutchoue, manufactured in the United States in numerous manufactories by processes which are his own, and for which he has patents in his which are his own, and nor which he has percuise a moven country. The eighteen to twenty licenses granted by Mr. Goodyear for the use of his processes, and a capital of more than 2,000,000f, expended in the establishment of his manufactories, attest the importance which this branch of manufacture has attained in America. Mr. Goodyear exhibits in his collection a number of articles of the same kind as those nanufactured in Europe, whether with vulcanized India-rubber alone, as springs for waggons, elastic maps, balloons, sponge-bags, tobacco pouches, or with India-rubber covered upon one or both sides with stuffs of various natures, or uniting together two fabrics by a coating of waterproof material according to the processes originally employed by Mr. Mackintosh In the manufacture of air-cushious and mattresses, and especially in that of waterproof garments, more strength and greater thickness are to be remarked than in the articles manufactured in Europe, but with less finish in the workmanship and less elegance in the forms. It may be thus clearly seen that these articles, which are as yet only used in Europe as objects of luxury or of more refused comfort, have already in America entered into general consumption, and become, by their price, within the reach of the least opnient classes, to the tastes and wants of which the manufacturer has been compelled to accommodate himself. Providence has given us in caoutchoue a species of natural leather, plastic and imperme-ulde to water, and which is especially adapted to increase the well-being of that class of workmen, the nature of the well-being of that case of workmen, the nature of whose occupations compels them to encounter the incle-mency of the atmosphere. In the manufacture of these articles it is, therefore, of importance that the resources and requirements of individuals of this class should be kept in view. Besides these articles common to the mannfactures of America and of Europe, Mr. Charles Goodyear exhibits a series of productions which have interested the Jury in a high degree by their novelty, and which promise to become the object of numerous and novel applications.

The ordinary deuts overed with India-rubber present as great resistance when they are pulled in the direction of the flows, but they have vith great fieldity if they are mainted by the waving. This is an inconvenience which might stand in the way of mose of their uses, and against the waving. This is an inconvenience which might stand in the way of mose of their uses, and against fidentiation of a species of said of feel; which he mann-festure by machines of his own invention. This staff, therefore the said of the said consistency as prefer of regard felt obtained by mechanical means, which can written the said direction.

By covering these stuffs, formed of three, four, and even for and at costs of catagode threes, this a thin term for an at costs of catagode threes, while a thin to the interview of the filters, will further increase to the contract of the filters, will further increase tracellar starties of a species of retaining and waterpoord paper—a real vegetable purchasent of which he has been completely associated to the contract of the contract of the same analysis and the contract of the contract of the contract to serve up very well adapted for primary and the contract to the contract of the contract of the same analysis and contract of the contract of the contract of the place and calculate sphere of darge distantance of the contract of the contract of the contract property. By covering with this waterpoor folices a species of weeken woulding in the new canaded in profor their learness of prices, and expectably for their lights, tool. By covering this name matter, described eithering with corons fibries, he has been after to expelye it in the contract of
With this kind of complex stuff are made, at the present day in the United States, the apparatas for life-boats, the insubmerable boats, as well as those postocoss inflated with air, which were first constructed by Mr. Armstrong, of New York, and which, by simplifying certain equipage which the armies were compelled to carry with them, have already readered service to the United States in their

war with Menico.

It is well known that the application of India-rabber to the manufacture of above was in a more expected to the manufacture of above was in a more expected property of the state of the st

Mr. Goodyne has, in addition to those, exhibited a feeperiment of a lith species of also, or entirely new periment of a lith species of also, or entirely new periment through with an infainty of very small below. In the multiplicity of objects to which constituous has been intely applied, it was proper that childhood should have its sfare. Mr. Charles Goodysar has conserved the constitution of the constitution of the constitution of the constitution of the constitution valuation of inclinabler, by heating it in moulds. He is thus enabled to produce of the constitution of the constitution of the constitution of shocks, and moisture, and which, while contribution to the piccauses of childhood, only deprive it of that

It has been alreedy seen how Mr. Charles Goodynes had in America, since the year 1844, worked is canochouse, to which the addition of enlightur nod carbonate of lead had imported the generate clasticity. By combate office contribute with nightur and majoravia he has latterly would be a supported by the support of the su

differently coloured masses, he has been able to produce shaded specimens, which are beginning to be substituted for horn in the manufacture of buttons, and of handles for penknives and table-knives, and which rolled out into thin sheets are adapted to take the place of wood in the venecring of furniture. Although this invention is as yet a recent one, there is good reason to suppose that it will very soon bear its fruits. By varying the preparations of sulphur and magnesin combined with the enoutchooe, it has already been made to attain different degrees of consistence; and probably in a short time industry will be able to discover in this substance, so indestructible, all the degrees of cobesion that solid matter exhibits in its most varied states. This enumeration of the articles shown by Mr. Goodyear at the Great Exhibition, incomplete though it is, nevertheless suffices to indicate the extent of the services which he has rendered to the art of applying India-rubber to the most diversified uses, and justifies the high distinction he has obtained, as well as the award which the Jury make to him of a Council Medal.

invention with a Prize Medal, 3. S. C. MOULTON, New York (534). Mr. Monlton exhibits some articles in India-rubber prepared in England, principally by Mr. Goodyear's processes, and which bave appeared to the Jury to be well made. They have particularly noticed some waterproof fabrics which Mr. Moulton exhibits as having been produced by machinery and without dissolving the esoutchout, a method, the result of which is to obtain waterproof fabrics entirely free from the disagreeable smell which they often pos Amongst the very numerons objects comprised in Mr. Moulton's collection, the Jury bave especially noticed some balf elogs, the same as those shown in the American Exhibition, but made with greater eleganor, and which, being easy to put on with a common shoe, easy to take off, and of a tolerably low price, seem to exhibit the form in which these articles (the utility of which is every day better appreciated) may be best eatended in Europe, and more generally employed there. The Jury have also noticed some articles of saddlery which exhibit a new application of valcanized India-rubber, in superseding the leather usually employed in their manufacture. The Jury award a Prize Medal to the exemble of Mr. Moniton's manufactures.

succeeded in impuring to it the rigidity and handless of wood, but of a plant wood, and therefore succeptified Sustrum, Paris (France, St.6), p. 1221). India-subbles, Sustrum, Paris (France, St.6),

therefore, what great advantage would arise in uniting together two substances, the qualities which should in some degree complete each other. Amongst the different articles of Messrs, Grossmann and Wagner's manufacture which have attracted the notice of the Jury, they have remarked some shoes to which these manufacturers have realized this union. These shoes, the soles of which are of leather, possess greater durability than those which are entirely made of India-rubber, and have not the defect of slipping upon the payement. The Jury have rewarded the manufacture of Messrs. Gressmann and Wagner, and pecially the perfection to which they have brought India-rubber shoes, with a Prize Medal,

5. THOMAS FORSTER, Strentham, Surrey (178, p. 787). Mr. Forster exhibits some waterproof garments of good make. These garments, in which the especial object has been to render them more accessible to the less opulent classes, are produced by means of the combination of ordinary enoutchone with certain resignant substances, which are moreover added to saitable quantities so as not to interfere with the suppleness or the flexibility of the fabric. Mr. Forster produces articles in the coloured paste of India-rubber, which he was the first to bring into use. The good quality of these fabrics made by Mr. Forster has been proved by long use. The Jury award him a Prize Medal

Jury award from a prize accusa, 6. Christopher Nickels and Co., 13 Goldsmith Street, Cheapside, Loudon (78, p. 783). The manufacture of clastic tissues constitutes one of the most important uses of India-rubber. Messrs. C, Nickels and Co, devote themselves with much success to this special numn-They exhibit a collection of articles of this description proceeding from their factories, which show of how great a variety this species of weaving is sus-ecptible. The clastic tissue serves oo longer solely eeptine. The cluster tissue serven do longer solety for the manufacture of garters, braces, and beha; it is applied to the maoufacture of gloves, sandals, elastic cords, and other articles of the same kind, of which Messra. C. Nickels and Co.'s exhibition contains a complete collection. The Jury award them a Prize Medal.
7. M. LEUNENSCHLOSS, Rouen (313, p. 1192). The manufacture of clastic tissues, which had its hirth in

France, has received in that country a great degree of development. It comprises the ouncrous fabrics of this description of productions, a few of which are represented at the Great Exhibition. The Jury have especially noticed the productions of this nature which are exhibited by M. Leunenschloss, and which are worthy of the reputation which this manufacturer has described obtained. He is moreover the author of several ingenions inventions, which have rendered this manufacture more easy and regular. The productions which he exhibits in braces and laces for tailors' and ladies' use, are remarkable for their good quality and their elegance. The Jury award a Prize Medal to M. Lennenschloss.

8. Messes. Holtraing and Höffken, Barmeo (1 Zellv. 652, p. 1086). The collection of braces exhibited by this firm presents a series of articles, jo which the threads of elastic tissue are employed for one of their most useful applications. The workmanship and appearance of these articles also entitle them to commendation.

§ 4. Honourable Mention,

I. Messrs. Bunn and Co. (77, p. 783). A very extensive and interesting collection of specimens of the various descriptions of India-rubber, more especially from Para. Also specimens of gutta perelia, and examples of the processes to which these substances are submitted in their preparation for application in the arts.

2. W. H. Beake (Class IV., 115, p. 204*). Speci-

mens of India-rubber weh manufactures of various kinds. These consist of tissues of alpaca, mohair, and Genappe hraids, covered with caoutehoue on one side, and having a peculiarly light and elegant character. and naving a peculiarry light and elegant ensineer. The exhibition comprises also specimens of "mineralized India-rubber," having the same properties as vulcanized India-rubber, and prepared with the object of avoiding the smell of the sulphur used in its preparation,

rubber, in a style which enabled the makers to sell them at a low cost. This is one of the establishments in America registered under Mr. Goodyear's patent.

4. J. C. Cosurso, United Kingdom (82, p. 783).

A variety of articles of dress made of various fabrics, and rendered waterproof by eaoutehous. The articles included coats which might be worn with either side outwards, also ladies' capes and hoods,

R. E. Hoisers, United Kingdom (72, p. 782).
 Various applications of the elastic property of vulcimized India-rubber, as in mechanical purchases, guns,

The Reporter would also call attention to the caoatchoic minufactures exhibited by Mr. J. Honsey, of

London, 188, p. 787, which cootnined several very elegant specimens of goods manufactured from vulcanized Indiarubber, as also fabries coated with enoutehoue of various colours, in which the coloors were mixed with the eaoutchone and not subsequently applied, so as to pre-veot their being removed by wear or the application of The ladies' and children's boots and shoes exhibited by

Mrs. TALLEAMAN (70, p. 782) afford an instance of a new and useful application of caoutchouc.

§ 5. Remaining Exhibitors, Under this head the Reporter has endeavoured to give a

list of the names of exhibitors of various articles made of eaontehone, or into which it enters, whether exhibited in Class XXVIII., or belonging to some other, J. SANDERS, 11 Fore Street, Cripplegate (73, p. 782).

India-rubber waterproof umbrella ten J. L. HANCOCK, Goswell Mews, Goswell Road (83, p. 783). Portable India-rubber shower-bath, hose-reel.

and infinted air-tight bed chair. S. MATTHEWS, 58 Charing Cross (81, p. 783). Large-

sized Iodia-rubber portable boat, and India-rubber cloak boat, designed by Licut. Halkett, R.N. Iodia-rubber portoble bath. C. JOUGERY, 8 Maddox Street, Hanover Square (Class XX., 40, p. 579). Self-adjusting white watered corset, Elastic corset belt for invalids. India-rabber tissue, of

French mannfacture J. S. Hall, 308 Regent Street (Class XXVIII., 184,

p. 787). Improved elastic over-shoes, with leather soles and plush heels, to prevent slipping. TURNER, Orehard Place, East India Docks (223, p. 142). Coal and its products. Products from caout-

chone and wood J. OUTRIDGE (29, p. 980). Choutchone from River Demerara, near the Falls. Milk from the cow-tree, from

River Demerara, . HUET, Rouch (Seine-Inférieure), and 12 and 14 Rue du Cimetière, St. Nicholas, Paris (270, p. 1189). Indiarubber articles, braces, and twists,

J. D. Leblond, Carver, 5 Rue St. Louis (an Marais) Paris (1301, p. 1239). Patent India-rubber male and female figures for artists. C. L. DUCCUURTIONS, Caontchoue Stocking Manufac-turer, 4 Rue Fontaine au Roi, Paris (1199, p. 1235).

Machine-made enoutchone stockings and belts.

BRIQUET and PERRIER, Tissue Manufacturers, 22 Roe Jeno Robert, Paris (1116, p. 1232). Elastic caontehone tissues for braces, garters, &c., and specimens of that manufacture.

in India-rubber, for ladies and geotlemen. Waterproof morocco pillow. H. H. Dav, New York (308, p. 1453), Iodia-rubber

J. J. ROMPLES, Erfurt (781, p. 1094). India-rubber elastic braces and watch-guards. Silk and half-silk shoe stuffs, mixed with India-rubber: shoes made of the same material.

ROOYACKERS and Son, Rotterdam, Makers (52, p. 1145). 3. Messrs, Church and Chitteness, United States Boots; varnished boots, the leg without scam, A Chinese (392, p. 1461). A collection of shoes made of India-boot. Boots of vulcanized caoutchoug. Louisa Piece, Goneva (233, p. 1281). Caontchoue kait stockings for invalids. J. Vis. (Louischoux Maonfacturer, 161 Rue St. Jacques, paris (729, p. 1213). Caontchoue tissues abstire stock.

J. Vir., Caoutehous Maonfacturer, 161 Rue St. Jacques, Paris (726, p. 1213). Caoutehous tissues, clastic stockings, belts, knee-caps, &c.

SECTION B.—MANUFACTURES FROM GUTTA PERCHA.

The substance designated by the same of gutts periods promounced periods, is the constitutes, actioners of representative periods, is the constitutes, actioners of a great master of the properties which characteries foliates are also as the constitute of the being spelled as provided as seen before its soil adopted. Gutts percha process as great an independent of the constitutes and wood; it is explicit of level profitted by best and of feather and wood; it is explicit of level profitted by best and wood; it is explicit of level profitted by best and wood; it is explicit of level profitted and wood; it is explicit the large and the constitution of the level profitted and wood; it is the shaped beautiful. The profitted is much level profitted than total level profitted in much level quantities than total levels and the profitted in much level quantities than total levels and the profitted in much level quantities than total levels and the profitted in much level quantities than total levels and the profitted in much level quantities than total levels and the profitted in the profitt

Whilst the plants which farmish caontchouc abound in the whole of the territorial zone which extends between the tropics, the Isonandra outta, belonging to the natural order Sapotaces, is the only tree which yields gutta It grows scarcely anywhere except in certain parts of the Malayan Archipelago, and up to the present time has been almost exclusively obtained from Singapore. It was brought for the first time into Eugland, in the days of Tradescant, as a curious product, under the name of Mazer wood, and subsequently it was frequently brought from China and other parts of the East, under the name of India-rubber, in the form of elastic whips, sticks, &c. In 1843, Doctors D'Almeida and W. Montgomery drew particular attention to it, together with its various singular properties, its easy munipulation, and the ases for which the Malays employed it. The most common employment of it was for whips: and it was by the intro-duction of a horse-whip made of this substance that its existence was for the first time known in Europe. The exhibition of the products of the East Iodies, shown by the Honourable East India Company, proves that the natives of the conotry in which the Isosandra gutta grows, knew also how to appropriate it to the maunfacture of different kinds of vases, and that Enropean industry has little more to do than to imitate their processes.

The importation of gatts percha into England, where the employment of this substance first drew attention, the employment of this substance first drew attention, the employment of the substance for the hore A,000,000 lks; and during the last three years the importation has assemented to a much larger quantity, and one which begins to cause some apprehension as to offer the end of the core of the property of the core of the

During the first few years of the employment of guts percha, it was the ensuine to end toom the tree for the purpose of chaining the pulse, which, left to itself, very off its own acrost. There is reason to hope that European industry will soon be embarked in the entitivation of this product, and that the Value (which is the name that the product, and that the Value (which is the name that the multiplied by means of a regular culture, naturalized in other countries that those to which it is indigenous, and worked by regular incisions, which will only take from volved by regular incisions, which will only take from volved by the terms of a regular culture, as the protor of the control of the control of the control of the volved by the terms of a regular culture, naturalized in volved by regular incisions, which will only take from volved by the terms of the relation of the control of the volved products of the means of furnishing at a low price of the means of the regular culture of the control of the control of the volved products of the means of furnishing at a low price of the means of the control of the control of the control of the control of the volved products of the control of t

a substance which is destined to render notable services to industrial and domestic economy.

The gutta percha, which arrives in Europe in the form of Innips of some pounds weight, is far from being pure. The natives of the Malayan Archipelage ninke no scruple of introducing into it stones, earth, &c.; the presence of which in the interior of these blocks renders a purification is dispensable, which purification, however, is capable of being attained without much manipulation.

Ever since its first introduction into Enrope, gutta per cha has, in fact, found everything provided for the purpose of elemsing it, and has been found expanle of being worked by the processes and instruments which are employed in the purification of India-rubber. At the present day the block of gutta pereba, ent ioto slices by a strong machine, is softened by means of bot water, divided and torn into shreds by the same machine that is used for India-rubber, which serves to kaead the gutta percha in such a manner that the crushed stones and earth may be separated from it on being diluted in the water; it is then dried, and submitted, by means of a owerful machine, to a mustication similar to that which ludia-rubber is made to undergo; and when, after some hours of kneading, the mass has become homogeneous and sufficiently softened, it is drawn by the drawing-mill into cylindrical cords, into tubes of various diameters, or it is spread out by means of the flattening muchine (as is done with lead) into sheets of various thicknesses, which are finally divided into bands, from which are cut out with a upping tool the pieces which are required to be employed in different uses.

Whatever difficulty monotherarer may have had in generating paths produced in the he make of they have presenting paths predicted in the he make of they have present paths and the second control and the second discovery of sec to which it is adapted; and in the space of a few years have delicerted masterias and imperioal and principal used of paths predix as to insperiod; he and principal used points predix as to insperiod; he and principal used points predix as to insperiod; he of non-manter. This is very nearly the only use to which or flower than the prediction of the prediction of the control of the prediction of the been flund to result from this employment of grant and control of the prediction of the correct produced the prediction of the prediction of the prediction of the correct prediction of the pred

Indestructible by water, and at the same time a bad conductor of electricity, gutta pereha has been found available for enclosing the metallic wirse employed is the electric telegraph; and the use of this substance may certainly claim its share in the saccess of the subnarine telegraph, which has just brought London and Paris within a few minnes of each other.

It may be conceived to what a variety of forms a substance can be turned which, becoming not five without adhering at the temperature of boiling water, regains at the ordinary temperature the slight clasticity and the consistence of bether. Thus agriculturities and manities that the slight classifier is a substantial of the inchests of all listed, light, inclustrativithe, and capable of being mended by a slight degree of heat and pressure when they are won cost.

It is especially in the mountercure of articles for maritime me that gutta percha, resisting as it does the action of water, and especially of sail water, appears to action of water, and especially of sail water, appears to the sail of the special percha as useful part in a waterpool gratrates. If India-rabber has been advantageously combined with leather, it may be consciented that the combination of gutta percha with wood, of which Mr. Forster has offer perchair arthraptes.

The decorative art has also taken advantage of the plastic properties of gutta pereha. All those different articles of furniture, the prices of which are so much enhanced by enrying, are capable of being reproduced by means of presance, and thus multiplied at a low price. Writing-tables, work-baskets, &c., can be produced in gutta percha, and thus be made to combine the threefold advantage of lowness of price, elegance of form, and absence of fragility. In the large manufactory which is more especially devoted to the employment of gutta percha, are made every day a great quantity of mouldings, friezes, panels, leaves, &c., and of articles of every de-scription. These, combined by the decorator, covered with gilding (which gutta percha takes in perfection), are, in the manufacture of picture-frames, and in the decoration of furniture, capable of superseding the carving upon wood, which is so costly, nr papier-maché and carton-pierre, which present the defect of great fragility. On going through the Exhibition of Messrs. Thom and Co., as well as that of the Gutta Percha Company, we may judge of the extent which the employment of this substance promises to the decorative art by the imitation of carving upon oak, rosewood, &c. Bronze articles have also been reproduced in a felicitous manner; and the elearness of the edges and the purity of the forms make it easy to understand how gutta percha has been found capable of being used for making galvano-plastic moulds, and how some experiments have begun to be tried for the purpose of substituting this material in the process of stereotyping, for the metal with which at the present day the pages of our illustrated books are multiplied. This employment of mutta percha for the reproduction, by oyment of gutta percha for the reproduction, by pressure, of objects for interior decoration cannot but be widely extended, enabling the many toenjoy those graceful and elegant forms which, as long as they could not be reproduced in a material indestructible by water and free from fragility, could only be brought within the reach of the few.

Quite recently, by the exertions of Mr. Truman, a lump of coloured gutta percha, moulded into the form of a juw-bone, has been found engable of holding together artificial teeth, and thus advantageously super-citing those settings in gold, which were so costly, and the absolute rigidity of which, moreover, presented much inconvenience. The alight but sensible elasticity possessed by gutta percha renders it, on the courtary, very well adapted

to this use.

There is another use to which the excritions of II. Mapple have rendered ratin percha applicable. Solve of this abstraces, flated on this upper benthers by memor of are not affected by water, which will last a long time, are very simple and commonical in their make, the roles of the property of the solvent of the solvent of the they conse oft, and can be made to serve mer by memor of a freak hesseling up when they have become unit for which cannot full to become extended in such a present manner as to resder nonlable service to health. SECTION C .- MANUPACTURE FROM IVORY, TORTOISESHEAL, SHELLS, BONE, WHALEBONE, HORN, BRISTLIN, &C., CORE, COTOA-NET FIRBE, VEGETABLE IVORY, &C.,

The articles manufactured from the above substances, and not included in other sections, are not numerous, but are of a very miscellaneous character; it is therefore, almost impossible to give any connected account of them, Many of these materials were exhibited us raw products in Class IV., as ivery, whalebone, curk, &c., and to the Report on this section the reader is referred for their natural history. Such substances as ivory, bone, and horn enter into the manufacture of many articles of use which have been referred to in the Reports on previous sections. The articles exhibited in this section will be referred to under each separate substance mentioned, and as near as possible under the heads before employed,

I. Animal Substances included in Section C. 1. Ivory.

This substance, obtained chiefly from the tusks of the elephant, of which a great variety were exhibited in Class IV., formed a conspicuous object in many parts of the Exhibition. Many of the articles farmed of ivory which were exhibited displayed those qualities of taste and design which, although some were intended for use, removed them from the class which contemplated objects of utility, and placed them for examination under the Jury of the Fine Arts. Such were many of the specimens of ivory carving exhibited by the Hon. East India Company. grote-que carvings of the Chinese, as well as busts and statues in ivory, were all thus placed beyond the jurisdle-tion of the Jury of Class XXVIII. The principal appli-cations in ivory brought before this Class were delicate veneers, combs, and work inlaid with ivory.

Prize Medals.

THOMAS STAIGHT, 12 Walbrook, Manufacturer (Class 1V., 109, p. 203*). Specimens of turning and carving in ivory. Many of the objects exhibited were beautifully executed. A set of ivory chessmen, representing Crusuders, was especially deserving of notice. There were also specimens of carving in pearl deserving of commen-

STAIGHT, D. and Sons (Class XXIX., 252, p. 802). Specimens of ivory veneering and other manufactures in

ivory of a useful kind

J. PRATT and Co., Meriden, Connecticut, United States, Inventor (567, p. 1469). This Company exhibited speci-mens of ivery veneer cut by machinery. These veneers were exceedingly delicate, une piece alone, 12 inches in width and 40 feet in length, having been sawn from a single tusk. The machine by which this veneer was produced was an invention of the exhibitors

Jonn Fenn, New York, United States, Manufacturer 111, p. 1440). An exhibition of several articles nanufactured from ivory. The workmanship was very superior. The cumb exhibited cantained 150 teeth in the

Noel, sen., 33 Rue de Lanery, Mannfacturer (France 666, p. 1210). A large collection of well-manufactured ivory combs with hollow round teeth,

August Hanenicht (Victor, 376, p. 1029), Amongst Accept Harencert (Venua, 376, p. 1029). Amongst a number of articles for fitting pr dessing-cases and for the toilet-table were some beautiful ivery cond. Leuwin Gersana and Co., Weishadcen, Nassan (13, p. 1132). A cup in ivory, with figures in alto and lesso relieva, the subject being Christ blessing the Children;

also brooches and bracelets in ivory, carved with much taste LOUIS JOSEPH MASSUE, 3 Ruo Aumaire, Paris, Manu-

facturer (615, p. 1207). A large assortment of well-manufactured ivory combs

— Wolf, 2 Rue St. Appoline, Paris (744, p. 1216).
Specimens of ivory curved in various forms. HOLTZAPIFEL and Co., 64 Charing Cross, and 127 Long

Aere, Manufacturers (Class VI., 232, p. 295). The Jury had their attention called to the beautiful specimens of lvory turning exhibited by this Company in the department devoted to the exhibition of machinery, where they were exhibiting their turning apparatus. They were specimens of plain and ornamental turning, but some of a very superior kind, H. WILLIAMS, Dublin, Inventor (163, p. 787). Eccentric

ivory turning without eccentric chuck. C. Shaw, Mount Street, Dublin, Producer (164, p. 787).

Specimens of mechanical sculpture in ivory, JOHN MAUNDER, Launceston, Cornwall (28, p. 780). A miniature dessert set turned in ivory.

In determining on the prizes in ivory work the Jury had some difficulty in ascertaining whether particular sp eimens belonged to their department, especially in the case of carving, in which case so many of the objects came under the Class of Fine Arts. Other exhibitors in ivory in Class XXVIII., to whom prizes were not awarded, were as follows :-Peter Jourson, Wigan, Manufacturer (15, p. 779).

collection of funcy articles, many of which are turned in

E. CRUNDACK, York, Proprietor and Manufacturer (18, 779). A collection of ivory combs made by hand, Walter Trueffer, 1 New Bond Street (65, p. 782). Carved ivory brushes and combs.

OSCAR SMITH, 21 King Street, Covent Garden, Manufacturer (95, p. 784). Specimens of ivory turning and carsing. G. GARRETT, 1 Victoria Terrace, Woodhridge Road,

Ipswich, Manufacturer (141, p. 786). Ornamental snuff-boxes turned in ivory. W. D. HEMPHILL, Clonmel, Ireland, Designer and Ma-

nafacturer (158, p. 786). A variety of specimens of turned and carved ivory Joun Francis Kain, 27 Brownlow Road, Dalston, Inventor and Manufacturer (45, p. 780). A full-sized hird cage made principally of ivory.

2. British Ivoru.

This substance was exhibited by Mr. HENRY BROWN, of 187 Whitechapel Road (49, p. 780), and on account of its being likely to turn out an important and valuable discavery, and in many cases calculated to supersede real ivory, the Jury awarded a Prize Medal to the inventor.

3, Tortoiseshell and Horn,

Tortoiseshell, which is abtained from several species of the reptilian order Testudinata, but the best specimens more especially from the hawkbill turtle (Testudo imbricuta), cuters into the composition of many articles found in other classes of the Exhibition. It is employed in the manufacture of workboxes, clock-cases, tea-caddies, cabinets, card-cases, spectacle-frames, and other things, It in also employed in the manufacture of combs, and these articles of use were exhibited in Class XXVIII. For whatever purposes employed, the tortoiseshell is prepared The part of the tortoise called the shell in the same way. exists as a layer of cellular gelatinous matter on the surface of the external skeleton. This substance is separated from the osseous foundation on which it rests, by the application of heat. For this purpose the whole shell of the tortoise is exposed to the action of heat till the epi dermal plates start from the bone beneath, and the final separation is effected by a long knife. The tortoiseshell, which is represented by the epidermis in other animals, is mainly composed of a substance resembling gelatine in its chemical character, and a small quantity of inorganio matter. On examination under the microscope it is found to consist of cells, which are naturally compressed, but may be made to assume a spherical form under the inflaence of a solution of potash and heat. On the application of heat the tortoisesbell becomes softened, and in this state may be compressed into any form required for manufacture. Sheets are thus prepared which, when cooled and cleansed, are submitted to machinery, by which they are ent into combs or other articles of use. No new or remarkable application of this substance came under the natice of the Jury. The collection of objects, however, exhibited by RICHARD PETERS and Son, of Birmingham (131, p. 786), and referred to another class, afforded several instances of the uses of tortoiseshell,

Hore is employed for all the purposes of tortoiseshell, and its much greater elempness gives it a more extended application. Knife-handles, buttons, nubrella-handles, whiptops, bell-pulls, drawer-knubs, sides of lanterns, besides all kinds of combs, are some of the purposes to which this useful substance is applied. In manufactures from horn that substance is chiefly obtained from the ox, although the tips, and even the whole horns of other naimals, as of the ram, the antelope, the buffalo, the deer, are employed for special purposes. Among the imports into Liverpool for special purposes. Among in 1850 were the following:-

Deer horns	_	_	250	
Buffalo horns -	-	-	200	
Butfido tips	-	-	120	
Ox and cow horns	-	-	700	

The latter were brought principally from South America, where they are obtained from the wild oxen of the Pampas Horn, like tortoiseshell, is composed of a gelatinous matter with inorganic salts. Under the microscope it is seen to he composed of cells, which indicate its epidermal character, in common with the matter of which the nails, claws, hoofs, and hair of animals is composed. The hurn which is used is developed around a vascular substance, which projects into the interior of the horn, and which is removed by steeping in water. In its preparation for manufacture, horu is exposed first to the action of boiling water, then of heat, under which it becomes softened, and may in proper moulds be made to assume almost any form. One of the best collections of articles in horn-work exhihited in the Crystal Pulace was that sent by the Sultan

or TCRKET, and the Jury accordingly awarded to his Highness a Prize Medal.

The following Prize Medals were also awarded for combs and articles of ornament manufactured in both tortoise-

shell and horn. E. CRUNNACK, York, Proprietor and Manufacturer (18, p. 779). Turtoiseshell and horn dressing-combs. FAUVELLE-DELABARE, 10 Boulevard Bonne Nonvelle. Paris (France, 202, p. 1183). Tortoiseshell and huffalo-

PHILLY, Passage Choiseul, Paris (France, 680, p. 1211). Bracelets, brooches, and ornaments in tortoiseshel

Poinsionon, --, 23 Rue Neuve St. Martin, Paris (France, Polisticoso, "23 net centre of control state of polistics
4. Mother-of-Pearl.

An extensive assortment of mother-of-pearl ornaments, An extensive assortment of mother-of-pearl ornaments, consisting of medallions, pen-holders, needle-cases, thim-hles, &c., exhibited by J. Schwarz, of Vieuns (684, p. 1042), and a collection of black and white pearl buttom by J. Charwis and Soxs (Class XXII., 256, pp. 625, 625), of Birmingbara, were the only articles brought under the notice of the Jury of this Class, and Prize Medals were awarded to each for the superior workmanship they exhibited,

5. Shells.

But few examples of the use of shells for cameos were seen in the Exhibition. A Prize was awarded to a collection exhibited by N. JULIN, of Belgium (383, p. 1163). Shells are frequently worked into the form of baskets, vases, &c., and are made to imitate flowers. This kind of work forms a considerable branch of industry in the West India Islands, in the Channel Islands, and in the Mauritius. Prizes were awarded for this kind of industry to

the following:-Mesers. Balketeld and Co. (Mauritius, 5, p. 956) The Misses Grieto (Bahannas, p. 976). Griet, The Countess of (Marritius, 1, p. 956). Miss Nicolla (Bahannas, p. 976).

In the collection of the Honourable East India Comny were interesting specimens of bracelets and necklaces from Dacea. The construction of these ornamental objects employs a large number of persons. They are made from transvene slices of the Turbinellus scolinus, and are often ornamented with metallic studs, or carved with various

6. Whalebone.

This substance is extensively employed in the arts, and was exhibited in its raw state in Class IV., and in various other Classes. Its manufacture for the purpose of covering whips, telescopes, and other instruments, and in thin strips for plait used in making bunnets and other articles of dress and use, came before the Jury of Class XXVIII. and the fullowing Exhibitors were awarded Prize Me-

II. Horan (Class IV., 103, pp. 201*, 202*). Westall and Co. (Class IV., 104, p. 202*).

7. Bristles.

Brushes of all kinds made from bristles were rewarded in the collections by the following Exhibitors:-

Prize Medals.

H. M. ENGELER and Son (Prussia, 242, p. 1061). Painting brushes Frso (Sardinia, 77, p. 1305)

G, Forse (Prussia, 813, p. 1095). Hall brushes instead F. A. FRINNEBY (181, p. 787).

E. LAUBENCOT (France, 1296, p. 1238). C. L. LONGRE-HAEZE (Belgium, 430, p. 1164).

K. G. PATTA (Austria, 350, p. 1024). A. SMITH (55A, p. 784). Pareting brushes. IL Sonzi (Belgium, 265, p. 1159).

Honograble Mention.

A, Dow (29, p. 780). L. F. FAUQUIER (France, 502, p. 1201). J. G. HINDE (196, p. 788). P. PAILLETTE (France, 1377, p. 1242).

8. Hair.

Besides the uses to which the hair of animals is applied, and which are noticed by other Classes, the Jury have had hrought before them a collection of bowls, dishes, plates, &c., formed of the hair of the rabbit, hare, and other animals, which are felted, and afterwards varnished. These utensils have the appearance of papier maché, or varnished leather, and possess the properties of being strong, durable, and very light. This manufacture is carried on principally in Russia, and a Prize Medal has been awarded to T. Bardoffsey (Russia, 265, p. 1375) for a collection of those articles.

9. Porcapine Quille.

Allied in their production to bristles and hair are the quills of the poreupine. In the Canadian collection were several examples of articles of clothing and furniture or namented with these quills, obtained from the North American por-cupine. The quills are dyed, and the colours appear to be durable; and this use of them seems to be new and worthy of imitation in Europe. A chair and other articles, this ornamented, were exhibited by Mr. W. Duxn, of Quebec (Cauda, 119, p. 965), and by Mr. R. Marshall, to whom Prize Medals were awarded. Several articles of dress, ornamented in this manner, were exhibited.

10. Quills of Birds

Goose and other hirds' quills are found in other Classes, but two applications of this material came before the Jury. In the first instance, E. R. Riony (58, p. 782) exhibited a collection of brushes made from split quills, which seemed to possess the qualities of cheapness and durability. The next instance was the application of the split quill to the making of children's caps and bonnets, and other articles p. 1229). Both these exhibitors were deemed worthy of a Prize Medal.

11. Silk-worm Gut.

This substance, used by the angler, and generally sup-sesed to come from China, is manufactured in Spain, and the specimens exibited from the province of Mureia, in the Spanish collection (199, p. 1342) were deemed worthy a rize Medal, (Awarded a Prize Medal by the Jury of Class 1V.)

11. VEGETABLE SUBSTANCES INCLUDED IN SECTION C.

Specimens of this substance in a raw condition, the produce of the cork oak (Quercus suber), were exhibited in Class IV. Many of the applications of eark found a place in this Class. The most interesting of these was that exhibited by Messrs. Espaines and Manghave (125, p. 785), in which various uses were made of eark which had been verseas. ad been veneered or cut into fibres. The following is the description of the specimens of this article exhibited, which the Jury have deemed worthy a Prize Medal:-

Case No. 1,-1, Specimens of finished hats, made of cork, with the vendors' names, and the respective weights, 2. Specimens of cork-hat bodies, or foundations, made

solely of cork. 3. Specimen of a cork-hat body, or foundation, strengthened by muslin, as generally made and used by the trade. 4. Specimens of cork plates, cut by steam machinery, varying from 50 to 120 plates in the inch, in the state in

which they are supplied to the hat-body makers.

5. Specimens of cork-tip pieces, of the like nature, in the state in which they are supplied to the hat-body makers.

6. Specimens of cork-hat cylinders, partly prepared and nade up, in the state in which they are supplied to the last manufacturers.

Specimens of cork-hat hrim plates, in the state in which they are supplied to the hat-body makers.

8. Specimens of cork-hat brims, jurily prepared and made up, as supplied to the hat manufacturers.

 Specimens of printing on eark plates, with type and engraved blocks, exhibited by Mr. A. J. Mayer, inventor of the steam machinery employed at the City Saw Mills in this trade, Case No. 2 .- Fibre cut from cork by steam machinery,

in its prepared condition, for the stuffing of ships' mat-tresses and beat cushions, to be used at sea for the preservation of life,

Case No. 3,-1. Specimen of a sea mattress, partially

stuffed with cork fibre. 2. Specimes of the same, finished.

3. Specimen of a circular bolster, similarly stuffed. 4. Specimen of the application of cork fibre, applied as n packing to the stuffing-boxes of steam-engine pistonrods, and which is said to require no Inbricating material. Case No. 4 .- Floating models, illustrative of the mode

of using the eork fibre mattresses and bolsters as lifepreservers at sea. To the following exhibitors Prize Medals were awarded

for general manufactures in cork, as well as the excellence of the manufacture of cork for the ordinary use of stopping bottles, casks, and other vessels:-

DUPRAT and Co. (France, 492, p. 1201). GEBONA, THE PROVINCE OF (Spain, 189, p. 1341). J. GUINART (Spain, 188, p. 1341).

2. Vegetable Ivory.

This substance is the albumen (perisperm) of the seed of a small species of palsa growing in the valleys of the Audes, whence it is now imported in very considerable quantities into this country. Hamboldt first drew atten-tion to its hardness and whiteness, and the uses to which it is employed by the natives of the districts in which it awarded to the grows. It is called the "niggers'-head tree," on account 235, p. 1344.)

of dress, also baskets, by J. C. F. Hadix (France, 1963, of the form and size of the large black drupaceous fruit in which the seeds are contained. The fruit coasists of several cells, in each of which is contained four seeds. The seeds are covered by a tough fibrous testa, which, on being removed, exposes the albumen, which represents the soft meat of the cocoa-nut and the seeds of other palms. At one end of the seed is a little cell, in which is enclosed the embryo, which seems to germinate without effecting any change in the condition of the hard mass by which it is surrounded. This is not the only palm whose seeds are hard enough for the uses of the turner, although the only one which is employed extensively for this purpose. The botanical name of the plant yielding these seeds is Phytelephas macrocorpa, and the order to which it belongs is that of Palmer. It is a good substitute for it belongs is that of Palmer. It is a good substitute for ivory, where appearance and dursbility are not principal objects. Its whiteness soon becomes tarnished, and it wears when used for articles where much friction is required. The only urticles made from this substance, required. The only princips made from this measures, exhibited in Class XVIII., were those of Mr. BENJANIN TAYLOR (47, p. 780), which consisted of a variety of objects turned with great skill, and for which in Prize Medal was awarded.

3. Cocoa-nat Fibres.

The seeds of the cocon-nut palm (Cocos sweifera), so well known by the name of " cocoa-nuts," are contained in a large fruit or busk, which is composed of long solid woody fibres. The natives of Ceylon and India have long made use of these fibres for weaving various coarse fabrics; hat although cocon-nuts were brought to this country enclosed in this shell, it has not been till recently that they have been manufactured in Great Britain. They are now used for cordage, matting, brushes, and other parposes, to which the woody fibres of other plants, and even the bristles of unimals, have been applied. Prize Medals were awarded to the two following ex-

T. TRELOAR (39, p. 780). Samples of matting made

T. TRELOAR (192, p. 199). Campies of insuring many of eccon-nut fibre (patterns provisionally registered). The same, with an admixture of Manilla hemp. Door-mats of cocon-nut fibre. Hearth-rug of the same. Mattress of patent curied cocon-nut fibre. Brushes and brooms, various, all filled with the fibre. Specimens of cocountifibre plait. Bounet and hat made of the plait. Specimens of senting, or fine cloth of cocoa-nut fibre.

WILDEY and Co. (40, p. 780). Specimen of manufactures from the fibre of the outer husk of the coconnut, consisting of floor-mattings, plain and coloured; door-mats; netting for sheep-folds and other uses; hansocks; nose-bags for horses. Cocon-nut husk; fibre from the same; fibre prepared for brushes, substitute for bristles; fibre curled, substitute for horse-hair mattresses; fibre dyed; yarn span from fibre; cordage, from fibre; curling and spinning by machinery, and patent preparation of fibre from the husk.

The use of cocos-out fibre for bedding presents many advantages; it does not become knotty or hard, it does not harbour vermin, and it is not affected by variation of climate; it is also recommended by the great chenpness at which it can be produced,

4, Pulm Leaves.

In their uses to the inhabitants of the tropics the family of palms represents almost all other families of plants. No part of these princes of the vegetable kingdom seems to be useless; and at every stage of their growth some new use appears to be developed. In the Mauritius collection, the Countess Gazy exhibited a basket and wreath of flowers formed out of the leaves of the double coconnut palm (Lodvicca Seychellarum), which were considered worthy a Prize Medal,

In the Spanish collection were exhibited some most beautiful specimens of plait, made from the fibres of a species of palm; also some elegant eigar-cases from the Island of Luron, and for which a Prize Medal was awarded to the Economical Society of Manilla. (Spain, D. GENERAL MANUFACTURES FROM WOOD, NOT BEING

FURNITURE, Under this head is included turnery in its various branches; carving, not having a special application, and not producing a work of art; all kinds of coopers' work,

1. Turnery

as well as basket and wieker work.

Many of the articles exhibited in this Class illustrative of turnery have been already referred to under the head of the materials employed in this art, more especially ander Ivory and Vegetable Ivory. The following exbihitors displayed objects presenting many points of interest in the art of turnery, though not regarded by the Jury as of sufficient importance to be rewarded with Prizes

B. Mitroup (167, p. 787). Concentrie balls, made of solid spheres of box-wood. This eurious art was first introduced by the Chinese. - GARRETT (141, p. 786), Ornamental turned souff-

boxes in ivory and fancy foreign woods.

J. Peri (175, p. 787). Turning apparatus for entiting in relief in the lathe. Fac-similes of medals, coins,

flowers, &c. OSCAR SMITH (95, p. 784). Specimen of ivury turning and carring, forming a pedestal, vase, and flowers, Unique specimes of ivory turning; a solid piece, the form of an egg, hollowed out to the thickness of the natural shell from a perforation of the twelfth part of an Turned by George A. Smith, 22 May's Buildings,

St. Martin's Lane. W. D. HENPHILL (158, p. 786). Plain and ornamental lvory turning.

2. Carving and Working in Wood,

The more beautiful specimens of this art were referred to the Class of Fine Arts. The following collections, however, presenting many objects of interest, and good instances of the application of carving to utility and the improvement of the form of articles of ordinary use, were Middled Prize Medals by the Jury:

N. Schröder (Grand Daeby of Hesse, 77, p. 1129).
A collection of geometrical models, (Awarded a Prize

Medal by Jury of Class X.)

N. P. Tresen (Sweden and Norway, 44, p. 1352).

A collection of wooden vessels for various purposes, ornamented with carvings. These articles are made by the peasantry, and the present collection came from

Christiana Captain Seea (China, p. 1420). A collection of objects brought by the exhibitor from China, and consisting of carvings in various kinds of hard coal and in pearl. KEHRLI BROTHERS, Meyringen (Switzerland, 242, p.

1282). A collection of articles of various kinds carved in wood The HEIRS of G. LANG (Bavaria, 77, p. 1101), Principally toys carved in wood. J. Wiatz (Switzerland, 259, p. 1283). Various articles

of wood carving. Spa, in Belgium, has long been celebrated for its work in wood; and a collection of boxes, exhibited by J. E. Marin (Belgium, 414, p. 1164), was regarded as worthy

a Prize Medal. The Jury also wish Honouruble Mention to be made of the beautiful collection of workboxes of the same kind exhibited by E, and L. Misson (Belgium, 412, p. 1164).

3. Coopers' Work of all kinds The collection of articles rewarded with Prize Medals

in this department are regarded by the Jury as worthy of that distinction, both on account of the neatness and Straw work.

durability of the workmanship, and the cheap price at difficulty of the workingship, and the views price of which they are sold. The American and Canadian pails are a very superior article, and calculated for extensive use in Europe. The tube and casks from Switzerland and Portugal iodicated admirable workmanship:

County Count

J. BAILET (Canada, 86, p. 965), Water-pail J. A. FAESSLER (Switzerland, 229, p. 1281). Milktubs, &c.

G. Loaing (United States, 424, p. 1462). A large collection of water-pails. J. W. Macoregon (146, Class XXVII., p. 786). Casks

for ships.

A. P. RANGEL (Portugal, 1120, p. 1317). Wine-casks. 4. Basket and Wicker-work.

Several collections of articles in this division were exhihited, some deserving mach credit, as those in the collection of the School for the Indigent Blind; but the Jury did not observe any qualities in them that would eall for more than the expression of their satisfaction at finding this brunch of art represented in the Exhibition. A basket made of willow wood, worked in a peculiar manner, called the Sussex truck-basket, was exhibited by Mr. T. SMITH, of Hurstmonceaux (172, p. 787), to which the Jury awarded a Prize Medal,

E. MANUFACTURES FROM STRAW, GRASS, AND OTHER MATERIALS.

The objects exhibited in this department were not numerous.

1. Indian-Corn Straw. This substance is manufactured into brooms in the

South of Enrope and in North America, and several col-South of Enrope and in North America, and several con-lections of these articles were exhibited. The following were considered as deserving of Honourable Mention:—,

D. PASTORELLI (Tuscany, 35, p. 1294).
R. Warner and Co. (United States, 431, p. 1463). la the Cauadian and American Departments several

exhibitors contributed brooms of this material, 2. Straw Hork.

In various parts of the Exhibition collections of straw, plaited and made into flowers, baskets, &e., were exhibited. In some instances willow shavings were plaited and made into articles of dress. The following rewards comprise various collections in this department which the Jury considered worthy of reward or distinction :-

Prize Medals.

ART BROTHERS, Wohlen (Switzerland, 227, p. 1281). Straw work. (Awarded a Prize Medal by Jury of Class

AMBROISE CLARAZ, Fribourg (Switzerland, 228, p. 1281). Straw work.
C. D'HEUBEUSE (Prussin, 244, p. 1061). Straw work.
F. P. Haas (Wurtemburg, 79, p. 1119). Various forms

of straw plaiting. J. RENDALL (144, p. 786). Straw work. SCIEDERGER and AREMANN (Switzerland, 234, p. 1281). Straw work. (Awarded a Prize Medal by Jury of Class XX.)

S. TANDLES (Austria, 657, p. 1041). Straw flowers. L. Tomassia (Austria, 97, p. 1012). Willow plait.

Honourable Mention. Islan and Orro, Wildegg (Switzerland, 213, p. 1280).

EDWIN LANKESTER, REPORTER.

London, February 1852,

CLASS XXIX.

REPORT ON MISCELLANEOUS MANUFACTURES AND SMALL WARES.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFECIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

Jury.

Viscount Cannino, Chairman, 10 Grosvenor Square.

Viercent Cavarro, Chairone, 10 Groveror Square.

**Producent, Papel Columne, France, Producent Spie Producent S

W. K. SMITH, Virginis, United States; Mineralogist,

D. W. MITCHELL, II Hanover Square; Secretary to the Zoological Society,
Richand Dawn, F.R.S. (Jamer Class IV.); Professor to the College of Surgeons, Lincoln's Inn Fields; President of the College of Surgeons,
NATALIS HONDOY, France (Juner Class XXVI.); late of the Embassy to China; Member of the Central Jury;
Delegate of the Cambers of Commerce of Lyous and Faria.

Members of other Juries, who by request attended some of the meetings of the Jury, and furnished information on the Chemical Arts.

M. BALARD, France (Juror Class XXVIII.); Member of the Institute; Professor of Chemistry at the College

A. PATER, France (Auror Chas IV.); Member of the Institute; Member of the Central Jury; Professor to the Central School, and to the Conservatory of Arts and Manufactures, at Paris.

THE number of Exhibitors of all nations in this Class is seven hundred and forty-two According to the list furnished under the title of Head Juries, this Class was intended to comprise the following

artieles A. Perfamery and Sonp.
B. Articles for Personal Use, as Writing-desks, Dressing-cases, Work-bones, when not exhibited in connexion with precious metals (XXIII.), and Travelling-gear gene-

rally

C. Artificial Flowers. D. Candles and other means of giving light.

E. Confectionary of all kinds. . Bends and Toys, when not of hardware; Fans, &c. . Umbrellas, Parasols, Walking-sticks, &c.

H. Fishing-tackle of all kinds, archery, &c. I. Games of all kinds.

Other Miscellaneous manufactures,

The latter title is very comprehensive, and might have been made to include all objects not specially enumerated in the lists of other classes. Practically, however, little difficulty was experienced in arranging with the Juries of other Classes for their adjudication of those manufactures with which they were most conversant; consequently to the above list there will have to be added only Artificial Essences, Blacking, Lacifer Matches, Artificial Ivory, Tasidermy, Ethnographical Models, Educational Models, Pipes and Amber-manufactures, and Spuff-bones. Candles were the only "means of giving light" brought before the notice of this Jury; and of beads those of amber only were taken into their consideration. The term "Miscellaneous" nevertheless was retained in order to enable the Jury to review a few objects not admitting of classifica-

elected their Deputy Chairman and Reporters. From this date antil the 23rd of July inclusive, the Jury continned their meetings for the most part three times a and having, on the latter day, sent in their final List of Awards, they adjourned.

Owing to the vary various character of the mannfac-tures brought before the notice of the Jury, it was quite evident, as its members could not be equally conversant with all, that it would be expedient to divide the Jury into Sub-committees, of which four were formed, whose duty it was to make a preliminary examination of certain allied classes of manufacture, and to report thereon before the discussion of the awards took place. In those pre-liminary caminations the Committees availed themselves freely of their privilege of calling in the aid of persons intimately acquainted than themselves with the

more intunted y acquainted than tenseries with the chimical merits of particular branches of art. to be made a list of objects belonging to their various sections, a labour strended with no little difficulty on account of the necessarily imperfect state of the Catalogue at that time, and also from the elassification which was adopted in the British Department, being impossible in the colonial and force of the control of th did not include all the articles ultimately submitted to the judgment of the Jury, and the Committees had often to search for them in other Classes.

The examination of the goods was usually commenced

before eight o'clock in the morning, and continued for six or eight hours during each day, the earlier hours being occupied by the entire Jury in visiting the various stands and discussing the Awards; whilst soon after the admission of the public the Jury for convenience again divided into Committees. It is quite possible that with Jury to Preter a few objects on summing or commonstices. It is quite possible that with The English Jurors held a preliminary meeting on the July of May, 1833, and on the 17th, the foreign Jurors having been appointed, the full Jury assembled and by more than one Jury, elicited on comparison of the award books at the close of our labours, amply to tifies the anxiety on the part of the Jurors generally not to pass any object of ment, even though they might feel doubtful as to its belonging to their respective closses

In recommending subjects for the award of the Council Medal, the Jury of Class XXIX, adhered strictly to the spirit of the instructions of the Council of Chairmen, and of the explanation given in the "Minute of the Royal Commission on the award of the Conneil Medal," and in no ease have they made any application for its grant, except for a new and useful investion in important arts. The recommendations were three in number, namely, in favour of L. A. Dr. Milly (France, No. 644, p. 1209), for the invention of practical methods of using line in the manufacture of stearie candles, and the me of boracie acid in the preparation of their wicks; Prick's Candac Company (Class IV., No. 83, p. 201*), for the invention of improved methods of treating and distilling fatty bodies, and the appliention of the products obtained thereby to the manufacture of candles; J. Mangues Con-STANTIS (France, No. 94, p. 1175), and (Portugal, No. 1299, p. 1318), for the invention of an elastic dressing to the materials used in the manufacture of artificial flowers. whereby they are not permanently injured if crampled in packing, but regain their form on being slightly shaken; also for the adaptation of textile fabrics to the imitation These recommendaof flowers for botanical museums. Juries; but the Council of Chairmen, whilst confirming the award of the Council Medal to L. A. De Milly and J. M. Constantin, negatived that in favour of Price's Candle Company. The Jury feeling that they had not made the recommendation until after a laborious investigation on the part of the Chemical Committee, Messrs. De La Rue, Hoffman, and Suith, and after ample discussion on their parts, protested on the 23rd of July against the decision of the Council of Chairmen in the

following terms :-"The Jury of Class XXIX, ananimously and respect-fully protest against the decision which the Council of Chairmen have come to respecting the recommendation of a Great Medal for Price and Company, and feeling that their decision is based upon insufficient information regarding the merits of the case, they hope that the Council of Chairmen will not refuse to reconsider the

In consequence of this protest, the Chemical Committee were invited to attend the meeting of the Council of Chairmen; two of their number, the Reporters, did so, and fully explained the grounds on which the recom-mendation had been made; but (as they were informed) it was subsequently found on reference to the minutes of a preceding meeting, that in consequence of a decision with regard to awards generally which had once been taken into consideration, the protest could not be enter-tained by the Council of Chairmen. The Reporters, however, cannot but regret that there should have existed any impediment to the correction of a decision which, from a careful scrutiny of the merits of the case, they emsider

The Prize Medal has been awarded for excellence of workmanship, navelty of construction, beauty of design, ar goodness of manufacture, combined. At first sight it may appear strange that the same reward has been given to a child's toy and to the botanical models in wax of flowers; to the important chemical art of stearie candlemaking, and to the apparently insignificant sugar-confectionary. On reflection, however, it must become evident that the only method of making the Awards was to discard for the moment the consideration of all Arts except the one immediately under discussion, and to reward excellence in that one, irrespective of its value as compared with any other. The estimation of the amount of merit recognized by a Medal must, therefore, mainly depend on the unture and difficulties of the maunfacture for which it is given, and marks only that an individual Exhibitor has attained a degree of perfection in no case inferior to that to be expected from the exist-ing state of the art as evinced by the examples in the

Building, or known to have been produced elsewhere. In the same branch of industry questions of relative merit were only so far gone into as not to reward mediocre or bad productions; and consequently it will be seen that the Medal is in most cases a mark of positive, and not of relative merit, the Jury not having pretended to select the best only, but also the very good. This will be best illus-trated by quoting an example, and for that purpose one of the most important arts is selected, namely, that of soapmaking. In this no extraordinary superiority of any one manufacturer was evinced above all the rest, but a great number had attained a high degree of perfection, in which only differences of degree might be traced. It is evident that the Jary could not have selected any one, are even two or three, for reward without doing an injustice to many others; and it became necessary either to give no Medals at all, or to give one in all cases of decided merit. The Jury chose the latter alternative. The distinction of Honourable Mention has been

accorded in those cases where the merit of the Exhibitor was far alove medicerity, yet still below that of the recipients of the Prize Medal.

The detailed Report is arranged in an order slightly

differing from that set forth at the enumencement of thi introduction, the following being the arrangement which was decided on:-

A. Monufactures depending upon Chemical principles, Soap and Perfumery. Candles.

Protean Stone, or Artificial Ivory. Blacking, Chemical Matches

Confectionary, and Fruits preserved in Sugar. B. Manufactures relating to Notural History, Artificial Flowers.

C. Articles connected with Education, Educational Models.

Ethnographical Models, Collections of Produce. D. Manufactures for Personal use.

Dressing-cases, Writing-desks, Work-boxes, Umbrellas and Parasols. Walking-sticks.

Fans. Pipes and Amber-manufactures. Sauff-boxes.

E. Monafactures relating to Amusements. Apparatus for Manly Games, viz., Cricket, Archery, Raekets. Fishing-tackle.

Toys. F. Miscellaneous

Including all articles not sufficiently numero or important to be classified under distinct

The plan followed has, in most cases, been to give a short historical sketch of the progress of an art, to discuss the scientific principles on which it is based, and to add such a description of the process employed as to enable the general reader to comprehend its chief details. The productions of each country, in alphabetical order, are then stated, and, lastly, the chief contributions of the successful exhibitors are specially noticed. The Report, however, is necessarily unequal in its details, some notices being much more complete than others. The Reporters are quite aware of these and other defects, and can only plead the very great difficulty of obtaining cor-rect information on such a variety of subjects as the Report contains, and the very diversified nature of the goods exhibited.

The Reporters have great pleasure in thanking their colleagues, Viscount Canning and Mr. Arthur Henfrey, for Reporta on special subjects; M. Natalis Rondot, for information respecting the arts in France and in China;

and Mr. J. J. Mechi, for the communication of statistics in some branches of trade; and, lastly, in acknowledging the assistance of their friends, Mr. Richard Thomson, Librarian of the London Institution, and Dr. Anthony, in supplying much historical unatter. The Commissioners of Her Majesty's Customs, and John Wood, Esq., the Chairman of the Board of Inland Revenue, have also contained in the Board of Indian Revenue, gave uso obligingly furnished the Reporters with statistical in-formation respecting the Imports into, the Manufactures of, and the Exports from, the United Kingdom, for which they take this opportunity of publicly expressing their best thanks. They have also made free use of those valuable French and Belgian Reports, entitled respectively " Rapport du Jury Central sur les Produits de l'Agricul Jury et Documents de l'Exposition de l'Agricul-ture et de l'Industrie Exposition 1849," aud "Rapport da Jury et Documents de l'Exposition de l'Industrie Belge en 1847,"

A MANUPACTURES DEPENDING UPON CHE-MICAL PRINCIPLES

I,-SOAP AND PERFUNERY.

The first of the two branches of industry now to be considered is probably of greater interest than any which will be discussed in the succeeding sections. The magnitude of the manufacture of soap, the importance of the trude, and the enormous capital embarked in it, as well as the wonderful relation which it bears with regard to the most important links in the chain of chemical industry, is not often sufficiently estimated. A distinguished chemist* of the present day says-

"The quantity of soap consumed by a nation would be no inaccurate measure whereby to estimate its wealth and civilization. Political economists, indeed, will not give it this rank; but whether we regard it as joke or carnest, it is not the less true, that, of two countries with an equal amount of population, we may declare with positive certainty that the wealthiest and most highly civilized is that which consumes the greatest weight of soap. This consumption does not subserve sensual gratification, nor depend upon fashion but upon the feeling, of the beauty, comfurt, and welfare attendant upon cleanliness; and a regard to this feeling is coincident with wealth and eivilization. The rich in the middle ages, persons under a profusion of costly scents and essences, were more luxurious than we are in eating and drinking, in apparel and horses; but bow great is the difference between their days and our own, when a want of eleanliness is equivalent to insupportable misery and misfortune!

It is interesting to east a glanec upon the early history of this important braneb of trade. No mention of soap is to be found in the works of authors prior to the Christian ers. The term soap occurs repeatedly in the Old Testament,† but the learned Beckmann! has proved, in his Treatise ou Soap, that the Hebrew word " Borith," which has been rendered soap, rather means alkali. One of the most ascient descriptions of batbing and washing is to be most abovent descriptions of battoug and washing as to be found in Homes's parrantive of the preparations made by the mother of the lovely Nausiena for the washing expe-dition to the river. Life-sunstaining meats and refreshing wines, softening oil in golden vessels for anoisting the skin, are carefully enumerated; hat soap formed no skin, are carefully enumerated; hat soap formed no part of the inventory. The Homeric virgins were igno-rant of this invaluable oleo-alkaline compound. Pliny is the first writer who gives us an authentic account of soap. He states that it is made from tallow and ashes,

- * Liebig's Familiar Letters on Chemistry, Letter xl., p. 129
- † Jeremiah, e. ll., v. 22; Malachi, c. iii., v. 2. † Beckmann's History of Inventions, translated by John-ston, fourth edition (Bohn). § Odyss. vi.

ij Pliny, Nat. Hist., xxvlii. (vol. ii., page 328 of Holland's translation), and in speaking of soap ointment, xxiii., o. 2,

the best materials being goats' tallow and beech-ash. He was also acquainted with the hard and suft varieties of soap; he calls it a Gallie invention, but states that it was particularly well prepared in Germany, where the men were more in the habit of using it than the women. It served to colour the hair yellow. From the description of Pliny, it is evident that he really means soap, although the purpose for which it was employed creates some difficulty; and it would appear that the soap of the ancients contained some colouring agent, and served chiefly as a hair-dye, and likewise as a remedial agent. It does not seem that it was used for the purposes for which it is now almost exclusively employed. Besides several kinds of fullers' earth," and plants with saponaceons juices (struthing), the nucieuts availed themselves of solutions of soda and potash, which continue in use for washing in the present day. Strabo speaks of an alkaline water (soda) in Armenia which was used by the scourers for washing clothes, and we find express mention of the emsasting erosics, and we mai express mention of the employment of a lye made with the ables of plants (pot-ashes), in cleansing oil and wine jars, and the images of the gods in the temples,† The metbod of strengthening the lye by means of quick-lime was known, undoubtedly, the type by sheard of queek-time was known, unconsecury, in the time of Panius Ægineta. The agent most commonly used for washing garments, however, was paired orine, which is still employed in the cloth-districts for washing wool. The fullers were literally and metaphorically in bad odoors, and were required to exercise their trade outside the town, or in unfrequented streets; but they were permitted to place tubs at the corners of the streets for the convenience of passengers and their own profit. Regarding urine in the light of soap, the Emperor Vespasian may be said to have originated the sosp-duty, as this soarce of revenue was not lost sight of by him, though, as Beckmann remarks, it does not appear very clear how the tax was collected,

After Pliny, soap is mentioned by Geber, in the second eentury of the Christian era, and at a later period frequently by the Arab writers; but although undoubtedly used for washing, it is spoken of chiefly as a remedial agent for external application. It would be a difficult matter to truce the onward progress of sosp-making, step by step, but it is certain that the boiling of soap flourishe in the seventeenth century, as we possess extensive directions of that date for its preparation

It is only in the most modern times that the soapannifacture has attained that extraordinary development which distinguishes this branch of trade; various cir-cumstances have contributed to produce it. The valuable researches of Chevreul, although they explain the nature of saponification, have contributed less to the advance of the soap-manufacture than to that of candle-making, bereafter to be described. On the other hand, the development of the manufacture of soda has proved a most powerful stimulus to that of soap, which when freed from its dependence on the uncertain and limited supply of has the personner on the uncertain and morred supply of barilla and keep, made such strides ac could not have been anticipated. Mr. James Manpratt, who was the first in England to carry out successfully, and on a large scale, Leblane's method of preparing sola from chloride of soldum (sea-salt), informa as that he was compelled to give away soda by tons to the soup-boilers before he suceeeded in convincing them of the extraordinary advantages to be derived from the adoption of this material. As soon, however, as he had effected this, and when the soup-boilers discovered how much time and money they saved by using artificial soda, orders came in so rapidly that Mr. Mospratt, to satisfy the demand, had his soda

* Several varieties of fullers' earth are exhibited in the Greeian section, Nos. 13 and 16, which, in all probability, are identical with those formerly used by the classical ancients; the reader is referred for the defaults to the *Ulust*, Cat., vol. Ili., pages 1492-3. There is also a specimen of fullers' earth-contributed to the South African Department by J. Calf (No. 55). See vol. ii., p. 952.

+ Egypt has sent some very interesting specimens of

Natros, or native sesquienrhonate of soda: this salt is the America, or matter resignate rot some this said is the tense of mineralogists. This has also contributed a specimen. See Egypt, Nos. 11, 16, 17 (Itlast. Cat., vol. iii., p. 1408), and This, No. 149, (p. 1416.) discharged red-hot into iron earts and thus conveyed to the sonp-manufactories. From that period a coostant race was kept up between soap-making and the artificial production of soda; every improvement in Lebiane's process was followed by an extension of the soap trace, and it is a carious fact that the single sea-port of Liverpool exports annually more soap at present than did all those of Great Britain previous to the conversion of chloride of sodium into carbonate of sods. The manufacture of soap has, on the other hand, been a powerful stimulus to the preparation of soda and of the important secondary product, hypochlorite of lime (bleaching powder), which are so intimately allied with almost all branches of chemical trades; thus soap occupies one of the most important pages in the history of applied elemistry. The increase in the consumption of this article has led, moreover, to the discovery of new materials for its production; it has opened new channels to commerce, and thus it has become the means as well as the mark of civilization. Almost the means as well as the mark of civilization. Atmost the cocon-not and the palm have been introduced into the manufacture of soap. The following statistics respecting manufacture of soap. The following statistics respecting demonstrate the increasing consumption of these oils:-

The development of the trade in palm-oil has contribated largely to the abolition of the iniquitous slave trade on the west coast of Africa, and in many parts of the coast has entirely suspended it.

Theory of the Formation of Soap.

Before we proceed to the examination of the separate specimens of soaps exhibited, a few words may be said respecting the materials employed in their manufacture. They are, on the one hand, alkalies, and on the other, fatty and resinous substances derived from the organism of animals and plants, especially tallow, lard, palm-oil, cocon-nut oil, olive-oil, linseed-oil, fish-oil, and common rosin. Although physically and chemically widely dis-tinguished from one another, fats and oils present unme-rous analogies. None of these substances is a pure chemical compound; the majority are mixtures in vary-ing proportions of different chemical bodies, which may be isolated by mechanical or chemical processes. When this separation has been effected, the isolated substances which are the proximate principles of the fatty or oily bodies, though again differing much from one another, exhibit one common chemical character; when exposed to the influence of powerful decomposing agents, they are broken up in a similar manner, yielding on the one hand an acid, and on the other a nentral body.

All fats may be resolved into two proximate fatty substances, one of which is fluid at the common temperature -- it is termed olein; the other is solid, and is called stearin. The prepondemnce of one or the other of these its property of dissolving in salt water readers it proportionate constituents determine the state of aggregation linky adapted to the formation of a Marine soap. One of the fat. The body usually designated atteries is generically a mixtor of the stearin of the details into an individual of the desire of the stearing that of the desire is under the desire of the stearing the stearing that of the desired that the stearing with a must hazer quantity of water than

analogous body, margarin, the two substances differing in their relative proportion according to the source from which the fat is obtained. Thus, the solid fat from sheep (tallow) contains chiefly stearin, that of the pig (lard) and of clive-oil, chiefly margarin; the solid fat of palm-

Stearin, margarin, olein, palmitin, and cocin are all compounds of certain fatty acids with oxide of glyceryl, and may be viewed as substances resembling neutral salts, or rather compound-ethers. The changes which all these substances undergo when submitted to the action of powerful bases is well illustrated by the deportment of olcin with oxide of lead (litharge). When boiled with this base, the olein is decomposed into oleic acid and oxide of glyceryl. The former combines with the base forming an insoluble soap, called olente of oxide of lead (dischylon plaster), and the oxide of glyceryl, separating in combination with water, forms glycerin (hydrated oxide of glyceryl), a substance bring a certain analogy with the group of bodies termed alcohols. It remains dissolved in the water employed. If olein is boiled with a solution of potash or soda, oleates of potash or soda are ohtained; but being soluble in water, they remain dissolved together with the glycerin.

The oleates of potash or soda, when separated from the water by processes immediately to be discussed, are what we call in common life Some. Similar some are formed by the remainder of the fatty seids, for example, stearie and margarie acids. Palmitate of seda, obtained by boiling palm-oil with soda, likewise forms a chief ingre-dient of many soaps,

Potash and soda, as they occur in commerce, are com hinations of the alkaline bases thus denominated by the chemist, with earbonic acid; and though, by long boiling, they could decompose (saponify) fats, yet the operation is tedious and the saponification generally incomplete. It is better to deprive the alkalies of their carbonic acid, which is done by mixing them with quick-lime and water; the quick-lime combines with the carbonic seid, forming an insoluble carbonate of lime (chalk), and the water retains the potash or sola in solution, contaminated still with such impurities as the alkalies contained (sul-phates and chlorides, for example), and a minute quantity of Caustic lime

Common rosin (colophony) is the residue of the distillation of natural turpentines, and consists principally of pinic acid, together with a little sylvic and colopbonic acids. When rosin is boiled with alkalies, carbonated nr not, a compound is readily obtained, but of course no lycerin. Thus, when it is boiled with soda, a pinate of oda is chiefly produced. This compound exists in conglycerin. siderable quantity in yellow-soap, and gives to it its distinctive character

The character of soap is not only affected by the nature of the neids which it contains, but also by that of the alkali which has served for its preparation; the scapa containing potash are generally soft and pasty, those prepared with sods are hard and solid.

The compounds of stearic, margaric, oleic, palmitic, cocinic, pinic, and sylvic acids with potash nr soda are all readily soluble in alcohol and hot water, but more so in the former, which, on evaporation, leaves the soap in a translucent state; hence its application in the preparation of "Transparent soaps." Soaps, however, are insoluble in n solution of many neutral salts, particularly when concentrated; this property is of great use to the sonp-boiler, who employs it for the separation of the soap from its solution to water, generally adding common salt to set the soap at liberty. As soaps are likewise insoluble in strong alkaline lyes, the same end is sometimes attained hy boiling down the sosp to a certain consistence, when it separates from the excess of lye.

The soap made with cocoa-unt oil is, however, soluble in very strong brine, and the same plan of separation does not succeed with it; but as it is more generally employed together with other fats, this difficulty is then overcume, most other roaps, thus giving a larger yield, but, of course, being of proportionally less value. This property is, however, unfurtunately often turned to profitable account by the seap-maker. As an instance, may be quoted an analysis of Dr. Ure, who found a London coccount of a scap to entain 75 per cent, of water, whereas 25 per cent. of water is a large quantity for any but potable-scaps to contain, and these generally contain less than 50 per

The greater part of our knowledge concerning the chemical constitution of flats, and the changes which aceumpany their decomposition under influence of allakies, is due to the materity researches of Chevreal, prosecuted with wonderful acuteness and perseverance in a collected form, under the title of "Reterrish Chimiques now let Corps Grass of Origine Asimula," a work which will over remain a model of philosophical inquiry,

Processes.

There are two processes theirly employed in the privation of respect, he must implied of this is that called the Cold-process (from the combination long national at the Cold-process (from the combination long national and their process (as it is generally effected in comparatively small vessels). water. The combination of the alkali with some part of the dirt cannot be denied. Several constituents of this very indefinite admixture of many substances are of an essentially acid character, especially those derived from perspiration: others become acid when exposed on a large surface to the action of the air, in consequence of a sort of spantaurous saponification. This action cannot, howof spontaurous saponification. This action cannot, how-ever, be the sole modus operandi of scap, the valuable properties of which without doubt arise, in a great measure, com its power of dissolving substances which are insoluble in water. We know that certain mineral salts exert a solvent power upon substances which are entirely insoluble in water: thus it is well known that borax causes shellhe to dissolve with great facility, and the chemist will at once call to mind the remarkable solvent property pos-sessed by a soapy-compound ready formed to the minual organism; hile is essentially a combination of an alkali with fatty acids (giveoclotic and tanrocholic), and it dissolves with great facility the neutral body cholesterin, which, like fats, is insoluble in water. In addition to these two modes of operation, soap doubtless also produces a mechanical effect. The property which it has of increasing the cohesion of water so as to enable it to form a lather or froth is most valuable in the removal of solid insoluble particles of dirt, which are carried away by the frictional action of the suds when forced into and out of the minute interstices of the substances subjected to the operation of washing, and are kept suspended by the froth and thus prevented from again soiling them.

So may be suffered to the state of the state

When we consider that there are some perappreciate the strong smelling musk more highly than any other, and another who would "die of a rose in aromatic pain," the definition of a perfume becomes a matter of some difficulty. Nowithstanding, however, the various impressions that volatile substances make upon different constitutions, a few general principles may be determined by which perfumery may be judged. In the first place, it is necessary to distinguish whether the substance is a themical compound, or whether it is a mechanical combiuntion of various chemicals. In the former case, if care-fully prepared, it is independent of the perfinne, and its odour, whether agreeable or repulsive, has a determined character of its own. In the latter case, that is, if the scent depends upon a mixture of substances, an opportunity is offered to the manufacturer of exhibiting his skill. Perfumes, on evaporation, should yield no resinous residue, and the various essential oils of which they are made ought to be combined so harmonionsly that none of the components is perceptible, not only at first, but even during the progress of evaporation. The less the ingre-dients differ from one another in odour and volatility the less difficult it becomes to achieve this desideratum. Hence well-prepared Eau-de-Cologne is generally con-sidered to be the perfection of perfumery. The constituents of this scent are, so far as is known, the essential oils of the lemon, the citron, and orange, prepared from the fruit indifferent stages of maturity, and they approximate so closely to one another as to produce a single aromatic impression. Other oils are added to Eau-de-Cologno, but in so mirate a proportion that they scarcely demand any notice in comparison with those mentioned Eau-de-Cologne that leaves a residuary odour either of otto-of-roses, oil-of-cloves, or oil-of-cinuamon, after volutilization, however agreeable these oils may be to individuals, must be designated as of inferior quality.

Still much practice is necessary to ascertain differences in the quality of the perfumes, and the task is rendered more difficult if numerous specimens have to be compared; for this reason the Chemical Committee returned repeatedly to the examination of the various specimens before reporting to the Jury, by whom the Awards were only fixed after a farther investigation.

Several of the perfames, or ruther essence scabilities, are of particular interest, and deserve an especial notice. We alliade to a series of artificial organic composade power of the contract of the contract value of the contract value (oils and essences. Artificial Oil of Bitter-Almonds.—As early as 1834, Professor Mitscherlich, of Berlin, pointed out a peculiar liquid formed by the action of fuming intrie used upon benzole, and possessing the odour of natural oil of hitter-aimonds in a high degree. It was called nitro-benzide or hitro-benzole. The preparation of this compound was, however, too expensive to admit of its substitution for

natural oil of bitter-almonds, as the sole sources of bengole, at that period, were the compression of oil gas and the distillation of benzoic acid. In 1844, one of the Reporters* succeeded in demonstrating the presence of this substance in common light coal-tar-oil; and in 1849, C. B. Mansfield† showed by a careful investigation that beasole may be easily obtained in large quantities from tar-oil. French Department, under the funciful title of " Essence de mirbane. the Reporters met with several specimens of oils, which on examination proved to be nitro-beuzole of more or less purity; they were, however, unable to obtain any positive information as to the extent of this obtain any positive information as to the extent of this manifacture; but it does not appear to be very considerable. The method employed in England for its preparation was devised by Mr, Mansfield, and is very simple; his apparatus consists of a large glass tube in the form of a cold, which at the upper end divides into two tubes, each of which is provided what has fanned. A stream of concentrated nairie and flows slowly into one of this funnels, and benzole, which for this purpose need not be perfectly pure, into the other. The two substances meet at the point of union of the two tubes, and chemical comhinstion ensues with the evolution of much heat; but as the newly-formed compound flows down through the coil. it becomes cool, and is collected at the lower extremity. It then merely requires to be washed with water, and, If then inferely requires to be washed with where, name lastly, with a dilute solution of carbonate of soda, to render it fit for use. Nitro-bezole is closely allied to oil of hitter-almonds in its physical characters, yet it preents a slight difference of odour which may be easily detected as the control of the control by an experienced person. It is very useful for perfuming soap, and is probably capable of application in confectionary and cookery, as its flavour resembles that of hitteralmonds, without containing any hydrocyanic (prussie)

sanction of the Excentive, examined, subsequently, a fresh sample, which was taken from a cask of Ean-de-Cologne which had remained under the care of the Customs, and which had been overlooked by the attendant. This sample was found to be equal in quality to the Eau-de-Cologne rewarded with Honourable Mention.

BELGIUM.

It is very remarkable that Belgium has sent to the Exhibition on green onf-song forast-song), for which it has been flumous from a very early period, and which, at one time, was an important article of exportation. Even now it is preduced to a far greater extent than the hard sods-song, the manifecture of which was commenced but Theory Joves, there, the preparation of districtions, Theory Joves and the programment of districtions, and he sends tollett-song outly,

BRITISH COLONIES.

The British colonies have not yet progressed sufficiently in the art of soap-making to compete successfully with the world, as regards quality; at the same time it must be stated that their productions are, in most cases, ere-The yellow-soap from Canada possesses a most disagreeable odour; the fancy soaps are likewise badly made, giving no lather whatever. The Cape of Good Hope sends a specimen of wall-made yellow-soap from J. Suttricms. India has contributed soap from Malabar, composed of cocos-nut-oil and sods, and made up into irregular bulls and long bars; this soap contains an execus of alkali, which effloresces at the surface, and is in general of alkan, which emoresces as the surface, alkan a greatest a very crude production. From Madras there is a speci-men of well-made marine-soap manufactured by F. Ker (p. 922); and from Cevion ornamented soap, called olassoap, manufactured at Kandy, from cocos-nut-oil. New South Wales sends very creditable specimens manufactured at Bathurst, 140 miles from Sydney; the collection courributes very good yellow-soap, manufactured by Comprises yellow, eard, and toilet soaps. Nova Scotia courributes very good yellow-soap, manufactured by Clanke, of Halifax (p. 970, Central Committee). New Zealand,—J. A. SNITR (No. 6, p. 1001), exhibits good soap made in Aucklaud. South Australia,-The good soap made in Aucklaud. South Australia.—The specimens from this colouy are all of yellow-suap, which was made by W. H. Buaronn (Class XXIX., Award Lists, p. 613), who is noticed in the List of Awards. Some Diemen's Land sends samples of good household song, made by H. CLEMBURN, of Hobart Town (Xu. 144, p. 595). The West Coast of Africa sends specimens, which are interesting, as having been manufactured on the Oil-coast they consist of soap made with a mixture of palm-oil and palm-kernel-oil, some made entirely with palm-kernel-oil, and soap made with ground-unt-oil, their production are likewise exhibited, The oils used in

Естрт.

A few interesting and excellent specimens of perfumery have been sent from Egypt, comprising Rose-water of Fayoum, Orange-flower-water, and Mint-water of Rosetta.

FRANCE.

Although modera discoveries in chemical science, by framishing a cheep substitute for barilla, have deprived flammilles of some of its local advantages, this town is still the chief centre of the sop-manufacture in France, and from its position in the moder of the oil-producing countries, it is likely for a long period to retain the high reputation which for ages it has enjoyed for the oil-ve-calsoap to which it has given its name.

At one period Marseilles supplied the whole of France At one period Marseilles supplied the whole of France supplied to a supplied the period of the control of the ally entailed by the establishment, good brouning gendiality entailed by the establishment, good brouning gendlarge towns, of soap-manufactories, in which tailor, planci, and other fasts, are employed in lieu of city-ceil besides which nearly all the steuric candle-makers convert their oelee sed into scorning and household sons."

^a M. E. Peligot has proposed to use the oleic acid of the stearic works for the scouring of wool, because it may be readily removed by carbonate of soid. This valuable plan does not appear to have mat with the encouragement it deserves, more especially out of France. The Parisian perfamers produce excellent toilet-soaps by the "large-boilet-process," remarkable for the fragency of the perfame, and giving a good lather. In many cases toilet-soap is manufactured by the "cold-process," and is generally of an inferior quality, giving only a disagreeable sline when used in washing; there are, however, ampoles in the Exhibition free from this defect.

Many French people never use soap to their faces, employing as a substitute aromatic vinegap, a few drops of which are added to the water used in washing. Hence the "vinaigred-ed-tollette," is an important manufacture, which is chiefly monopolized by Paris, whence it is sent to all parts of France. There are Three Exhibitors of

this aromatic vinegar.

many is generally very good.

with the muriatic acid, and forming muriate of potash with the marante need, and rormang naturates of polassis (chloride of potassium), the soda combining with the fatty acids, and forming a soda-soap. At one time this plan was of great value to a coustry like Germany, removed from the source of barilla, and producing little or sone herself. Modern chemistry, by furnishing an abundant supply of cheap soda, however, readers this circuitous chairs of much hear value, and it must herefore give was n of much less value, and it must therefure give way

to the enward march of science. The Zollverein States of Germany are represented by Four Exhibitors of soap; Three manufacture household and scouring soap of excellent quality; the other, toilat-soaps. Hamburg is represented by One Exhibitor of floating and other toilet-soaps,

The perfumers of Germany are in great force, being Eight in number, and reckoning two John Maria Farinas in their ranks, making no less than four Farinas in the Exhibition, all claiming to be the original. It appears that speculation is carried to so high a pitch in Cologne, that any child, entitled to the surname of Farioa, is bargained for as soon as born, and christened Jean Maria; at times this event is aven anticipated. The perfumery of Ger-

is represented by Oue soap-maker, who exhibits olive-oil-

soap, and toilet-soap of fair quality. PORTUGAL.

sends the produce of the Royal Seap and Tobacco Con-tractor. The collection comprises olive-oil-soda-soap tractor. The collection comprises (Marseilles); rosin-and-tallow-soap (yellow-soap) and toilet-soaps, all of which are creditable.

There are only Two Exhibitors of soap in the Russian

Section, one from St. Petersburg, the other from Warsaw, The latter sends very excellent toilet-soaps. Russin possessed, in 1842, Sixty-four soap-manuf tories, which produced soap valued at 205,8001.; and, in the government of Moscow, Three manufactories of per-fumery, employing Fifteen workmen, which produced

goods valued at 5,080%.

The quantity of soap manufactured in Spain is very large, and exceeds that required for her home consum; tion, a considerable portion being annually exported to the Spanish colonies. The common hard-soans are those principally produced, and they are made by the "cold-process." The following is a list of the towns and provinces in which the manufacture is chiefly carried on, the figures indicating the number of manufactories, wherever it was indicating the manner or manusciories, wavever is no accertainable :—Badajos (Zoeres; Cadis, 3; Burgos, 4; Gerous; Guadalajara, 2; Guipaneoa; Huelva, 2; Hueses, Jaen, more than 10; Legrono; Malaga, 7; Madrid; Navarre, 7; Oreuse; Port St. Maria, 1; Tarragous, Talada : Valenaire, Saville, 19; Societ, Samoraca 16; Jeen, siove than 10; Logrono, Mainga, r; Rasara, Navarra, r; Owene; Port St. Maria, 1; Tarragona; Avarra, r; Couse; Port St. Main, 1; Tarragona; Course of the Prostern, I. Madrid is represented by Owene; which is noble at hoots a persoy per proud less than the state of the product of the product of the maria factories; constaining of the ordinary mottled Castile-scap, made with hardin and the collection of the confinery mottled Castile-scap, made with hardin and the walchate of from. This scop is very perfect, and is by sulphate of irou. This soap is very perfect, and is sold at the rate of 5l. 11r. 3d. per cwt., or almost exactly In 1843, Malaga produced 19,700,000 lbs. ls. per pound. see pourse. In 1843, Managa produced 19,700,000 lbs. of soap; and in 1844, according to information collected on the spot hy M. Natalis Roadot, Cadiz, Xeres, and Port St. Maria yielded 450,000 lbs.

SWITZERLAND.

The contributions from Switzerland consist merely of a small quantity of tooth-powder and hair-oil. It is stated that the tooth-powder is in general use, and is prepared from an indigenous stone, which is calcined and pulverized.

TUNES.

The Tunisian scops are composed of clive-oil and sods,

and are made in every part of the Regency, generally in copper vessels, holding from 40 to 50 cwt. each. The soda-lye is prepared by mixing the crude soda with the necessary quantity of lime, and putting the mixture into a reservoir, when water is added; under the reservoir is a well which catches the caustic lye as it flows from u hole in the bottom; from the well it is transferred to a copper vessel, and mixed with a proportionate quantity of oil, and boiled until it is made either into a hard-soap, or into one of a softer sort. The price of the hard-soap is from 30s, to 32s, per cwt., according to that of the olive-oil; the soft-soap is about 25s, per cwt. Soap is a very important article of commerce in Tunis, and is generally used by the lowest classes, whose habits of cleanliuess are remarkable. There are five specimens of soaps made into bars; a toilet-sosp, moulded by putting it into a small brase cup; and a jar of soft-soap; all of which are of a very primitive make.

The Tunisian collection of perfumery consists of scented waters, without any admixture of alcohol; they are prepared by distilling the flowers with water in a copper still. The ottos of Tunis, which are obtained by repeated distillations, are prized as being more fragrant, and are consequently more costly, than those made in Eastern countries, the usual price being from 3l. 15s. to 5l. per ounce, according to the description of flower from which they are obtained. Perfumery constitutes a most im-portant branch of commerce in Tunis, a great quantity of scented waters being annually exported to France, Genoa, There are also specimens of Swak, which is and Malta. There are also specimens of Swak, which is used by the Moorish women for whitening their teeth; and perfumed necklaces, noticed in the List of Awards.

Turkey has sent u great variety of soaps, many of which are perfumed with mask, and ornamented with inscriptions; one kind, from Adrianople, is made up into hollow balls, containing a small bell, similar to those sometimes attached to the collars of horses; the Reporters sometimes attacked to the counts of norses; the Reporters oould not, however, ascertain the purpose of the bell. The collection comprises soap from Adama, Adrianople, Candia, Jerusalem, Damascus, and Tripoli, benides a soft-soap called Alicant soap. None of these soaps afford a good lather

The perfumery consists of :- orange-flower water and The perfumery consists of:—ornage-flower water and rose-water, both very firgarant; Texsooh or musk-pasts; Kouderma or pastilles, for hurning in the Seraglio; Tensouh, or musk-pasts medallions, purses, and and uccklace; and amber Tesbihs or chaplets, made of a paste composed of various perfumer. As the names of the Exhibitors of these various articles are not given, and as it. appears that the specimens were bought at the bazaars,

TESCANY.

Tuscany sends the produce of One Exhibitor, comprising olive-oil-soap, tallow-soap, and yellow-soap; the two for-mer may vie with any in the Exhibition, but the yellowsoap is not equal to that of English manufacture. In 1848, Tuscany possessed Sixty manufactories of soap and candles. In no country in the world is the manufacture of soan

UNITED KINGDOM.

carried on to so large an extent as in the United Kingdom, in which there are Three hundred and twenty-nine dom, in which there are a mre numered man eventy-more makers, besides Sixty-eight soap-remelters (perfuners). Ireland not being subject to a duty on soap, there are no ready means of ascertaining the quantity which is there manufactured; but in Great Britain alone the production amounted in the year 1850 to 201,410,826 lbs, and yielded an Excise-duty of 1,299,232l. 10s. 2d. Of this quantity 12,555,493 lbs. were exported to foreign parts, the draw-back on it being 82,308l. 18s. 9d. The total quantity

• Io documents published from time to time by the French Minister of Commerce, it is stated that the common otto-of-rose is sold in the banars at 5 plastres the miks!: reckonlog the mithal at 4.75 grammes, er 73-774 troy gralus, the avoirdupois ounce of 537-5 genios would cost

consumed in Great Britain, therefore, amounted to 191,855,333 lbs. Of this quantity 22,858,382 lbs. were used by manufacturers, on which the duty, amounting to 97,342, us. 11d., was remitted. This leaves the net revenue derived from the soap-duty at 1,119,581l, 10s. 6d., after deducting the drawback and the remission to mannfacturers. Deducting the quantity exported, and that used by manufacturers, it appears that 168,996,951 lbs., or, in round numbers, 75,445 tons, were consumed in 1850 for domestic use in Great Britaiu (making 8 lbs. 1 oz. each person); besides that manufactured and consumed in Ire-land, of which there are no retures. The Excise-duty was first imposed in Great Britain in 1711, the rate being 1d. per pound. In 1713 it was raised to 14d, per pound, and in 1782 the duty on hard-soap was fixed at 21d., and that on soft-soap at 11d, per pound. In 1816 the duty on hard-soap was raised to 3d, per pound, at which rate it was levied until May 31, 1833, when the duty was reduced tu 14d, per pound on hard-soap and 1d, per pound on soft-sonp. The present duty is according to rates, with an addition of 5 per cent. The collection of this duty (notwiths) anding the great improvement in the Excise regulations of late years) places the British mannfacturer under certain restrictious as to his operations, which prevent him from conveniently making toilet-soap In order to obtain toilet-soap the ordinary soap has to uudergon second process of clarification, and, after having been perfumed, has to be made up in some presentable form; it is this which has given rise to the business of the soap-remelter, who buys his soap of the maker, remelts, perfumes, and then makes it into tablets. Exhibitors, however, of tuilet-soap carry on all the operations in their works. In Ireland the perfumer generally makes his own soap by the "cold-process," and One

porticles, but it is easily detected on dissolving the scap

in water.

At present very little soap is made in this country from olive-oil, partly because, since the alternation in the duty on foreign soap, its manufacture does not reay the coapmaker, and partly on account of the "London New "Cattlie-ong," as it is found to be better adapted for the retextion of a proper degree of moisture in pharmsceutical preparations.

Out of the 329 soap-makers of the United Kingdom, only Seven come forward to represent the soap-irade. On comparing the productions of other nations with theirs, it is evident that as regards tallow, palm-oil, and rosin-soaps, the British soaps are generally better manufactured, notwithstanding the Excise restrictions under which the English mannfacturer labour.

English mannfacturer labours.

The English toilet-soaps are in no respect inferior to those of other countries, and are generally far superior in their detergest qualities, on account of their being made from soap manufactured exclusively by the "large-boilerprocess. The high reputation of the so-called Windsor-soap in all civilised States is an ample testimony of the estimation in which English toilet-soap is held by the makers of other countries, who adopt its name for any sort they wish particularly to recommend. The preparation of toilet-soaps is generally confined to the remelter. whu perfumes and ornaments them in various ways. The marbling is effected by rubbing up the colours, such as vermilion or altramarine, with a little olive-oil or soap, and taking a small portion on a palate-knife, which is pushed through the melted mass, and moved about according to the fancy of the operstor. Many soaps are coloured throughout their mass with mineral colonrs. Vermilion is used to produce the pink colonr of rose-soap, artificial ultramarine to produce hlue, and various ochres to prosoap into a mould, fixed in a lever-press, and composed of a top and bottom die, which fit into a loose ring; hy n rapid pressure the shapeless mass takes the form of the ring, and is at the same time embossed on the top and bottom of the cake. The urnamenting by means of coloured cameos is effected in a similar manner, but requires two presses, one of which forms the cake, and makes depressions for the reception of a different coloured soap, which is filled in by hand, and the cake is then placed in the second press, which embosses the coloured portion

No less than Twelve out of the Sixty-eight sospremeters of frost lifetinia cabilit. Most of them send solo perfunercy; and Eight manufacturers, besides the Twelve English of the Sixty of the Sixty of the Sixty of the Gaussy and Found in many cases to be very fragrant and agreeable, but in others the employment of an access of some strong-smelling essential oil remedered the compound consumption of perfunercy into the United Kingdom in the year 1550 were substituted in 1907, and adapt was paid of 1917, but in all probability some spirituous perfuners are consumed, "of which 172,139 [98, were insported, and

which yielded a duty of 12,772!.

Two Exhibitors have contributed specimens to which alinsion has been made in the preceding pages, and to which a great degree of interest attaches, as being among the first attempts at the application of harmless chemical

95

compounds for the imitation of the flavours of fruits and compounds for the initiation of the involves of reals and liqueurs, namely, Oil-of-Pears, Oil-of-Apples, Oil-of-Pine-apples, Oil-of-Cognac, Oil-of-Grapes, and Onion-Sauce. There are Ninety-five Exhibitors of soap and perfu-

mery; of this number Sixty-two are solely ur chiefly manufacturers of soap, and Thirty-three solely or chiefly manuncturers or soap, and Thirty-three solely or chiefly makers of perfumery, though many of the perfumers send both soap and perfumery. Of those who exhibit soap, Seren (kuglish) are merely remelters and perfumers of the goods they purchase of the roap-boilers; Five are makers of a floating of foam-soap; and Four exhibit soap made by the "cold-process."

Among the perfumers there are Two who exhibit savory sances, and Five the artificial essences before described.

Of the Ninety-five Exhibitors there are—

31 Holders of a Prize Medal. 18 Who obtained Honourable Mention. 46 Unrewarded.

Besides this number, Eight stearie-candle makers have also sent soap made with the olcic acid, derived as a secondary product from their mannfacture; these eight raise the number to One handred and three, but no special notice will be given of their productions in this portion of the Report.

LIST OF AWARDS.

ALLARD and CLAYE, Paris (France, No. 750, p. 1216). Prize Medal. A collection of fancy Toilet-soaps, in large blocks, marbled and otherwise ornamented; soap in cakes and balls; Potash-shaving-soap. These soaps are made in the ordinary manner, in the large boiler, and afterwards perfumed; they are most agreeable in use, giving very readily an abundant lather, and are free from an excess of alkali. Their perfumery is of various kinds, and very good.

and very good.

Armarus, H., Marseilles (France, No. 402, p. 1197).

Prize Medal. A very large collection of Marseilles
mottled (Casilie-scap), Yellow pain—oil, and Blesched
palm-oil-scaps. The yellow soaps are not so sightly as
those masunifectured in England, but are good. The

toose manumetureu in Enguado, ont are good, The motted Marseilles soap is, however, excellents, No. 36, p. 1434). Prize Medal. A very large collection of fancy soaps; Transparent-soaps, made up into eakes and balls; Transparent-shaving-paste; Hazel-unt-olsoop; husts of American savants. The soaps are well manufactured, fragrant and agreeable.

Besides the above, various spirituous perfumes are exhibited, which are not included in the award. BLEURE, H., Paris (France, No. 1091, p. 1230). Ho-

nonrable Mention. Soaps and perfumery. The soaps are manufactured by the "cold-process," and they give a tolerable lather, BURFORD, W. H. (Sonth Australia, p. 1061). Honour-

able Mention for well-mada Yellow-soap Bescu, P. A. (Frankfort, 5 Zellv., No. 2, p. 1121). Honourable Mention for Rectified Cognac-oil.

CADWELL, PAYSON, and Co. (United States, No. 510, p. 1467). Prize Medal. A soap called Excelsior-soap, not very sightly, but possessed of remarkable detergent properties, especially in very strong brine. In the trial made with this soap, it was found to possess the valuable property of readily removing tar even in salt water, which renders it peculiarly well adapted for a Marine-sonn. A comparative trial was made at the same time with scouring-scaps, selected from the best in the Exhibition; they

all answered as well as the Excelsior-soap, except in the removal of tar when washing with a solution of salt.

Much stress was laid on the low price (30s, per cwt.) at which this soap may be produced; but as on examination

it was found to contain earthy matters, with which any soap may be much reduced in cost, the lowness of the

soap may be much reflered in cost, the lowness of this price did not influence the Jarry in their Aurard. No. 43, Chriotza, C. L., and Sox, Frieste (Austria, No. 43, Chriotza, C. L., and Sox, Frieste (Austria, No. 43, Christian, P. 1998). Superfine Marcelles; Illne-amparated Flusting white Genes; Hard imitation English copy; white Card soap, for toilet purpose, also filter and Ret-markled; Cocco-aut-oil toilet-soap; besides various screted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited in the secreted soap; all of which affird an excedited soap and the secreted s and are, in every respect, carefully manufactured, and free from an excess of alkali

CLEAVER, F. S., 18, Red Lion Square (Class XXIX., 20, p. 790). Prize Medal, Mr. Cleaver is a soap perfumer and remelter; his large and varied collection comprises the following descriptions:—Honey-toilet-sonp; this soap contains no honey; it is perfumed with the essence of citronelle, and is a very agreeable toilet-sonp. May-hlossom-soap is a honey-soap containing cream of tartar. Peach-hlossom-soap is a composition flavoured tartar. Procurement of the composition of the composition with oil of bitter almonds, and made up into balls, which derives a peculiar peach-like partial stain from the addition solely of cream of tartar. Sonps marked by Dunn's process of lettering, which consists in stamping recesses of the shape of the letters, and filling them with sonp of a different colonr.

different colour.
All the scaps are of most excellent quality, very fragrant, and afford a copions inther.
grant, and afford a copions inther.
Homosarbie Mention. (The same, No. 101, p. 1219.)
Class II.) Artificial essence of Bitter-almonds; artificial
essence of Pine-apple. (See pages 1347 and 1348.)
Coxyst and Sox, Leghorn, (Tuucany, No. 23, p. 1293.)
Prize Modal. Olive-oli-song (white Marreilles); Olivedirections of the price of the same price of the oil-mottled-soap (Castile-soap); Tallow-curd-soap-most

excellent in quality. Cowan and Sors, 139 New Gravel Lanc, Shadwell, (Class XXIX., No. 19, p. 790). Prize Medal, Pale-yellnw-soap of very excellent quality; Curd-soap, most carefully prepared; Marine-soap, for washing in salt water. This collection, though comprising few varieties, is valu-able from its showing the degree of excellence attainable

able from its showing the aggree of executive missing in the art of sog-making.

Dr. Leon v. Rico, E., Madrid (Spain, No. 243, p. 1344), P. 1344, P. 1640, P. 1600 availab (Mexition. A very hard Office-oll-snap, made in twenty-frant hours, by the "cold-process." It affords a lather with some difficulty at first, but by the second day's use acquires a little moisture and then gives one more readily. This plan of making does not yield a soap equal to that of the "large-boiler-process," but the specimen is very good of its kind, and free from excess of alkali,

Doto Las, J. S., and Sons (Hamburg, No. 92, p. 1139), Prize Medal for toilet-soaps, under from cocon-nut-oil and soda, (probably by the "cold-process"); Marbled-soap, made from tallow; likewise the Floating or froth-soap; all of which are of good quality. This latter, in the true spirit of puffing, is alleged to be made according to a re-eipe which a friend transmitted from China, and which

erpe when a freed transmissed from Camas, and when the obtained by bribery, on peacerating into the Imperial Scap-Mannfactory of Canton. Eon and Co., 47 Lodgest Hill (Class XXIX., No. 18, p. 790). Honourable Mestion. For a case containing Perfuncty of various kinds. The imitation of the secat of flowers was found in many cases to be successful, FARINA, JOHN MARIA, 23 Rhein Strasse, Cologne, and 1 Salter's Hall, Cannon Street, London (Ciass XXIX., No.

21, p. 790). Honourable Mention. For a long period after the opening of the Exhibition, M. Farina distributed his fragrant Fau-de-Cologue, with great liberality, by means of a fountain. The specimens exhibited in bottles were of excellent

quality, evaporating perfectly without resinous residue.

Fastna, John Masta, Cologne (Prussia, No. 426, p. 1074). Honourable Mention. Very fragrant and agree able Ean-de-Cologne, evaporating perfectly without resinous residue.

FARINA, JOHN MARIA, opposite the Juliehs Place, Cologue (Prussia, No. 858, p. 1096). Prize Medal. Eaude-Cologne of most excellent quality, possessing in a high degree that fragrance and freedom from unpleasant resi dnary odour, for which this article of toilet is esteemed. dnary odour, for which this article of foolet is esterement.
Farina, Join Mania, opposite the New Market,
Cologne, and 62 Mark Lans, Loudon (Anstria, No. 748,
p. 1044). Ean-de-Cologne. Honourable Hention.—See
Introductory matter, Austria, p. 609.
FISHER, I.W., and CO., King's Head Court, Barblean
(Class XXIX., No. 22, p. 790). Honourable Mestion.
Three cases of perfumes, and a sauce known as Harrey's

sauce. The Jury accord an Hosourable Mention of the perfomery, which is fragrant and leaves no residuary unpleasant odour after evaporation.

GELE and Co., Paris (France, No. 845, p. 1220).

Prize Medal. For a very large collection of fancy Toiletsonps, made by the small boiler, or cold-process, and free from the defect of not giving a lather, which is usually the case with soaps made in this way. And also, for an

assortment of very agreeable performery.

Gings, D. and W., Milton Street (Class XXIX., No. 305a, p. 818). Prine Medal. These exhibitors are among the few British soap-boilers who also performe among the few British soan-bollers who also perfuse their samp for toll-epuryses. Their shape for mana-their samp for toll-epuryses. Their shape for mana-employed by woollen and silk mannfacturers for the more delicate goods; soap used by silk dyers to give bril-linary to their goods; and a Black-soft-soap made from the strick on Candles, page 619, it is chiefly used for scouring course wools and carpets, and is sold wholesale at 25 per lb. The bloosabelds aspect computer White-card of excellent quality; Mottled equally good; and very fine Pale-yellow-scaps. The Toilet-scaps exhibited are chiefly those ornamented with inlaid, embossed, and co-They are well perfumed, and give a good loured cameos. They are well perfumed, and give a good lather. The Shaving-tablet, contained in a gutta-percha case with a movemble bottom, is one of the vary best possible contrivances for that purpose.

Giro, Juan, Malaga (Spain, No. 344, p. 1344). Ho-nourable Mentiou. Three bars of Olive-oil-mottled or Castile-soap, made in the ordinary manner, in the large boiler. The alkali used in its formation is barilla, which, as before stated, was at one time the only source of carbo

as begive stated, was as one time the only source of carro-mate of softs, but it is almost entirely superseded in other parts of Europe by that prepared from sea-sult. Gnosestring, Johns, 99 Friday Street (Class XXIX., No. 13, p. 790). Prize Medal. The Jury award a Prize Medal to this Exhibitor of his Perfemecy and the mannafacture of Artificial-essences applicable to the flavouring of confectionary and other purposes; for instance Pine-apple, Jargonelle, Onion, Oil of-cognan; these artificial essential oils are generally used in the proportion of 1 os. to a gallon of spirit .- See pages 608, 609

HAUEL, JULES, Philadelphia (United States, No. 4, p. 1433). Prize Medal. Olive-oil-soap, Transparent toilet-soaps, very agreeable and well-manufactured. They afford a good lather.

The perfumery which is exhibited, is not included in the Award. the Award. HENDRIF, ROBERT, Tichborns Street (Class XXIX., No. 10, p. 780). Prize Medal. A collection of soaps amongst which are some curious matters. Brown-Windsorwoop; Amber-soap containing amber-oil; Wax-soap and to mix with colours for distemper-painting; Petroline-scap prepared with a mixture of 30 per cent. of Bar-badoes tar, and 70 per cent. of scap; this scap is intended

to be used as a remedy in cutaneous affections. Benzo-amygdalize-soap, which is a soap prepared with a mixture of almond-meal and gum-benzoin. M. Hendric exhibits likewise a large collection of very good Perfumery.

The Jury have not pretended to discuss the merits of the unusual compounds; but make their Award on the general excellence of Mr. Hendrie's Perfumery and Toilet-soaps.

Tolici-coaps.

KENDALL and Co., Dublin (Class XXIX., No. 25, p. 790). Prize Medal. These manufacturers have exhibited two cases containing twelve very large blocks of Marbled-soaps, besides skryt boxes of various Fancy-coaps. All the scops are made by the "cold-process," and consequently contain the glycerin resulting from the saponifi-cation of the fat. The materials used in their formation are lard, and a very pure soda-lye. Great cure has been bestowed by Messrs. Kendall and Co., in the manufacture of these sosps.

of these sospa. Kxtorr, Jork, 9 Old Gravel Lane, 8t. George's (Class XXIX., No. 8, p. 790). Prize Medal. Most excellent Primors or Paley-Plow-sosp, made with tallow, American rosin, and soda; Mottled tallow-sosp for household purposes, equally good; 50 of Possah-sosp, having the fig-lika appearance, which is much esteemed as an indication of careful manufacture.

Landon and Co., Paris (France, No. 1290, p. 1238). Honourable Mention for Aromatic-vinegar for toilet-purposes, very refreshing, and free from adhesive residue on cyaporation.

LANGDALE, EDWARD F., 83 Upper Thames Street (Class XXIX., No. 55, p. 792). Honourable Mention. A collection of Artificial-essences, now much used for A collection of Artificial-seacces, now much used for finevaring confectionary and beverages, consisting of the following:—Chi-of-Cogne, Chi-of-Cappels, Chi-of-Cappels, Chi-of-Cappels, Chi-of-Cappels, Humanumble Mestides to this Exhibiter; for the successful preparation of these various ethers applicable as a sub-stitute for natural rulus.—See pages 608, 609, Lxurvers, G. L., Paris (France, No. 908, p. 1223). Prize Medal. Excellent Arousaties or Tollet vinegar;

Creosote: Ean-de-Paris, a fragrant and agreeable perfume, resembling Ean-de-Cologue, but possessing a character-istic odont of its own.

LIPP, FREDERICK VAN. Düsseldorf (Prussis, No. 658, p. 1086). Honourable Mention. For an agreeable per-fume, called Düsseldorf water.

rame, cancel Disseldort water.

Martin, Maria Clerkeritz, Nun at Cologne (Prusia, No. 425, p. 1074). Prize Medal. Ean-de-Cologne of very superior quality, being that which was considered the most fragmant and agreeable in the Exhibition. The same odour was found to be persistent throughout the evaporation of a small portion, none of the essential oils becoming distinguishable, which is frequently the case with the inferior descriptions. Also Melisse Carmelite

spirit, or holy water (alcohol).

MELEZE, D., Hermannstadt (Austria, No. 44, p. 1009).

Hendourable Mention. The Jury accord an Honourable Mention to the Olive-oil-scop, Fancy-scops and Floatingsosp, which are of fair quality.

soap, which are of fair quality.

Millian, jun, Marseilles (France, No. 928, p. 1224),

Prize Medal. White Marseilles or Olive-oil soan. This
is a good specimen of the kind to which Marseilles gives
its name, and for which it is celebrated.

OGUR, J. L. M. (France, No. 139, p. 1225). Prize
Medal. Collection of Household and Tollet-soaps in barn

and cakes. The bousehold-sosps are excellent, and the soap, has a very peculiar jasper-like mottling, not seen in English soaps. The collection also comprises Plontingsoap; white Marseilles or olive-oil-soap; tallow or Curdsoap; rosin or Yellow-soap. This collection is very important, and highly interesting, and cousists entirely of

scaps of the very highest class. Palis, A., Berlin (Prussin, No. 263, p. 1063). Prize Medal. Palm-oil-scap and tallow Mottled-scap (with a peculiar wavy mottling), of excellent manufacture and great detergent power. Both the soaps are free from any efflorescence of peutral salts, although they have become

very dry. PEARS, A. and F., 91 Great Russell Street, Bloomsbury (Class XXIX., No. 24, p. 790). Honourable Mention, The Jury accord an Honourable Mention to Messrs, Pears for a small collection of Transparent-soaps, the mannfacture o; which they allege their father invented upwards The Jury tried one ball of the soan of forty years since. of forty years since. The Jury tried one out of the soap which was stated to be twenty-five years old, and found it, though much darker in colour, to be very good. The price of spirit of wine in this country has prevented Messrs, Pears from obtaining a very large sale for this sonn, but in America its manufacture is carried on to a

considerable extent. Pives, L. T., Paris (France, No. 1678, p. 1257). Prize Medal. Various kinds of Toilet-soap; spiritnous Per-fumery; perfumed Hair-oil and Pomatum; Transparentpotash-soap or Shaving-paste. Two soaps are especially deserving of notice, that called Lettuce-soap, and the Orange-flower-soap, as being perhaps even more agreeable than the others. All M. Piver's perfumes and soaps are

of the very highest class. RINNEL, E., 39 Gerrard Street, Soho, and Paris (Class XXIX., No. 3, p. 789). Honourable Mention, The Jury accord an Honourable Mention for the Perfumery exhibited, which is of good quality: Besides these there are Hair-dye, Perfumed-bouquets, Poma-

Sarre, H., jun., Berlin (Prussia, No. 255, p. 1063). Prize Medal, A block of Palm-oil-soap, and Tallow-curdsoan, well manufactured, of great detergent power, and

free from any efforescence.
STERR, H., Warsaw (Russia, No. 364, p. 1383). Prize
Medal for Brown Windsor-soap, Floating, and other Toilet-soaps, well manufactured and very agreeable.

It is curious to find that the name "brown Windsor."

It is carrous to find that the name "brown Windsor," should have been adopted even in so distant a locality as Warsaw. The soap, moreover, has a great resemblance to that manufactured in this country.

TATLON, H. P. and W. C., Pbiladelphia (United States, No. 392, p. 1453). Prize Medal. A very large collection of Transporent-soaps, some of which are quality arranged to form a window, in imitation of stained glass. They are very agreeable, and afford an excellent lather.

Taylon and Son, King's Road, Chelsen (Class XXIX., No. 5, p. 790). Prize Medal. These Exhibitors are perfumers of the soaps which they buy of the soap-boiler, and they have carried to great perfection the art of perfuming and mixing the various sorts of soap so as to running and mixing the various sorts at some so as to produce agreeable compounds for the toilet. The "Old Brown-Windsor-sonp" is particularly to be distinguished as one of great excellence. The other soaps are Almond, Otto-of-rose, Lavender, Honey, and Shaving. Besides scaps, Mesers. Taylor and Son exhibit spirituous and squeous Perfumes, of which they are the distillers, and which possess the fragrance of the respective flowers. The Rose-water, Elder-flower-water, and spiritnona Lavender-water, may be cited as examples of great execllence. The spirituous perfumes comprise "Pure Lavender-water," "Perfumed-lavender-water," Millefleurs and Water, "Permindent account water, Since are Rose-water, Honey-water, Peppermint-water, and Diliseed-water. Trollon, Grenoble (France, No. 1701, p. 1257). Ho-

nourable Mention. Concentrated essences for flavouring inquers: these are very numerous: some resemble the flavours of the fruits which they are intended to imitate, whilst others require a little imagination on the part of the epicure.

TOUCHE-GILLÉS, E., St. Laurent, Antwerp (Belgium, No. 434, p. 1164). Prize Medal, Excellent Toilet-soaps, affording a very shundant lather. The collection com-

scented Palm-oil-scap, which is most agreeable for the toilet; also a toilet scap called " Saron d'adoucissement"

emollient scap). BEY of TCAS (Tunis, Nos. 53 to 57, p. 1415). Prize Medal. A collection of a variety of Perfumed-waters (not spirituous). There are Ninety bottles of these perfumes, amongst which may be cited Rose-water, Quince-water, Apple-water, Musk-water, Jasmine-water, which is very fragrant; Millefleurs-water, composed of jasmine and other perfumes; White-rose-water, Aloe-water, Henzoin-water, Citron-water, Cinnamon-water, Carrawey-water, Orange-flower-water, water distilled with a mixture of benzoin and other perfumes, Cedar-wood water. Also perfumed tablets and necklaces worn by ladies: these are composed of a paste made of amber, musk, and aloe,

Likewise jasmine pomatum The greater portion of the perfumed waters are very fragrant; some few are peculiar, and to persons uneccus-

tomed to their use not agreeable WILLIAMS, JOHN, and Son, 28 Compton Street, Clerken-well (Class XXIX., No. 4, p. 790). Prize Medal. A collection of soups for manufacturing and household purposes, and also perfamed toilet soaps. These Exhibitors are soap-boilers, as well as soap-perfamers, a combination of two, generally, distinct branches. Their common soaps are exceedingly well manufactured, and are possessed of great detergent properties. The collection comprises, Olive-oil-soap, which is much used by the fine-cloth mannfacturers; White-curd (tallow) soap, used principally by the lace bleechers; Pale-yellow and Mottled-soap, for household purposes; Scouring-soap, containing designedly an excess of alkali, which effloresces on the surface: this soap is made chiefly for consumption at Leicester. It answered well for washing in a strong brine, and therefore

might be used on board ship.

The fancy-soaps are agreeably perfumed, and give readily an abundant lather. The principal description of toilet-soaps are Brown Windsor, Rose-soap, and the socalled Honey-soap

WUNDER, L., Liegnitz (Prussia, No. 250, p. 1063), Prize Medal, Tallow-soap, with a peculiar wavy mottling, very well mannfactured; Palm-oil-soap, of good quality, and excellent white Curd-scap; the Award is to the fore-Besides these, there is a toilet-soap called Ananas up, the perfume of which does not at all resemble that

soup, the pertume of which does not at all resemble that of the pine-apple, and is moreover very disagrecable. YARDLEY and STATHAM, Vine Street (Class XXIX, No. 2, p. 789). Honourable Mention. A soap called the "genuine Honey-soap," is very good, and gives an excellent lather, but it does not contain any honey. At one cellent lather, but it does not contain any honey. At one time honey was put into tollet-one, but was discontinued in consequence of the mais/bitly appearance it produced; the name, however, is still retained. The other soaps exhibited are, the "True Winter-soap," Heliotrope-soap, white and Brown Windsort-soap, which are equally good. Many of the Toilet-soaps are stated to have some culiar emollient and whitening effects on the skin; it is, however, to be hoped that the public will soon becom sufficiently enlightened to huy the soups for their real and not for their fabulous qualities,

II. CANDLES.

In tracing the little which is known respecting the early history of Candles, it is impossible to avoid the meution of Lamps also (although these were not amongst the articles submitted to the consideration of this Jury), as both are intimately connected not only in their history, hat also in their philosophical bearings; for however much candles and lamps may differ in other respects, they are identical in this, that both are contrivances in which, for the purposes of illimination, a wick of fibrous material is employed to effect the combustion of fatty bodies; which, for the most part, under ordinary circum-stances, could be ignited only with difficulty, and if ignited, would soon become catinguished. The chief the ejecute. Texturest, Autwerp (Beigium, Texturest), a planted, wouls soon necessarily make the first in the language of the client Texturest, planted, pla countries, especially in those where oil-yielding plants are not common, animal-fat is employed for feeding lamps; and it is even probable that the ancient Hebrews may likewise have used occasionally solid fats for the same purpose. The modern mortar night-light is also a lamp of this kind.

Frequent mention is made of the candle in the Old and New Testaments, in metaphorical as well as literal significations; but from the description of the candlestick of gold which Moses made by the command of God, it is more than probable that the Hebrew expression translated "canale" really means lamp, for in £zodas xxv., after the minute description of the form of the candlestick, with its six branches, it is said, at verse 37, " And thon shalt make the seven lamps thereof, that they may give light over against it." Again, in Leviticus xxiv., v. 4, the Lord directs that Aaron shall order the lamps noon the pure candlestick; and in verse 2 of the same chapter, the fuel used in the lamps is shown to bave been olive-oil

Torcbest may be regarded as a coarse description of Torebest may be regarded as a coarse description of candles, which indeed possibly originated from them. They are meutioned also in Holy Writ, in a passage, ermarkable as being the coly one in the New Testament where the lasters is spoken of 'John xviii, v. 3); " Judas then having received a band of men and officers from the chief priests and Pharisees, cometh there with lasterns

and terches and weapons.

The information respecting candles, mentioned in Pliny's Natural History, is very slight and ill-defined. That which is most to the present purpose is contained in book xiii, chap. 13, where in describing the books reported to have been found in a perfect state of preservation in the grave of Numa, 535 years after his interment, the anthor states that they lay near a quadrangular stone in a box which was bound all over with candles, and to that defence their preservation is ascribed. From this passage it would appear that candles were employed in the earliest ages of the Roman history; and, inferentially, that they resembled in some degree either our longest wax-tapers, or else match-lights made of pitched rope, for short candles could macon-ignus made of pitched rope, for short candles could not have been bound round any object. I not describing in book xvi., chap. 37, the "brittle rusbes" that grow in marshy districts, he says that they serve to thatch houses and make mats; and the pith of them, when the rind is peeled off, is used for making wicks for worto-candles and forment lights; to hore, by dead bodies while the pecete oft, is used for making wicks for isotro-consist and funeral-lights, to burn by dead bodies whilst they lie above ground. This description may be considered as referring to candles very similar to, if not identical with the modern rushlight; but as the fat used in their formation is not alluded to, nothing certain is known on the subject, 6 In book xix., chap, 1, when speaking of flax, Pliny remarks that the fibres nearest the rind are only fit for lamp and candle wicks; and in book xxxvii., chap. 3, that if the scrapings of amber are put into oil, they will burn and

* in Lane's Minners and Customs of the Modern Egyptisms there is a description of a folding lantern of waxed cloth, and tha lamp which is put into it. This, in Arabic, is called Chandee'l, with which our word candle may possibly have some connection; for it is more than likely that the same word was used to designate in former times either lamps or candles.

* British Gniana has contributed an interesting specimen of toreb-wood from the river Demorara, which, when beaten so as to separate the fibre, is used for torches by the indiana. It is supposed to be obtained from a species of Americ or

Icon.

The same story is also related by Livy, lib. xi., c. zo,
with the additional statesment that the books were bound
round in a package with hee candles, which seems to indicate that flux formed into torches with pitch or wax, were
made to hold the massucripts together. These employed, simply to hold the manuscripts together. These torches prohably somewhat resembled the tarred string used for the purposes of illumination in the present time by workmen engaged at night in laying down gas or water

of workamen engages as man is my to properly the property of the Irish candles in Feshrooke's 5 The description of the Irish candles in Feshrooke's Large, Ant., p. 240, however, throws much doubt upon this conclusion. It is there stated that they were formed, like those of other nations, of poetler trushes disped in butter or grosse, and placed in home of other nations, of poetler trushes disped in butter or grosse, and placed in home of oil. (Ledwich, Ireland, 1720, not). p. 225.)

maintain light both longer and more clear than wicks made of the best of flax: from which it would appear that, although the refuse flax was usually appropriated to lamp and candle wicks, the best flax was sometimes used for

As regards the fuel used in lamps, in addition to the mention of oil, Pliny, in book xxxvi., chap. 15, states farther that the inhabitants of Sicily barned a kind of bitumen, resembling an unctnous or oily liquor, in their lamps; and that they collected it from the surface of a spring in the territory of Agrigentum. Although in book xxi., cbap. 14, various kinds of bees wax are mentioned, and the method of wax-bleaching is miuntely described, which, it may be remarked, somewhat resembles the process employed in the present day,—no aliusion is made to the application of wax to the mannfacture of candles: nor in speaking of tallow and other animal fats, and their separation from the cellular tissue, is it stated that they

were employed for candles.

From Fosbrooke (Encyc. Antiq., p. 472, 4to Edit.), who copiously refers to most of the best authorities elucidating this subject, the principal of which have been carefully examined for this Report, we learn that wax was employed by the classical ancients for candles; the wick was made of rope and leaves of the papyrus, and such candles were carried by children at marriages, and were used at carried by cultures at marrages, and weve used it funerals. And the same authority (p. 403) adds that their illuminations were made not only with lamps, but also with links and wax-flambeaux." He states, moreover (p. 240), that the rich Romans naed lamps, and the poor employed candles. Beckmann has recorded a notice that employed candles. Beckmann has recorded a notice that the Emperor Coustantine, about the beginning of the fourth century, "caused the whole city of Constantinople to be filluminated with lamps and orax-candle on Christmas-Eve." (Hist. of Ise., Bohn's Edit, ii. p. 174.) Appleius distinguishes wax and tallow candles by the terms Cerei

and Sebacri In the middle-ages, continues Foshrooke, wax-candles were made of various sizes, some exceedingly small, and others weighing so much as 50 lbs.: they were made in moulds, the wicks being formed of twisted tow. He likewise states that they were made at home in gentle-men's houses. Whilst describing the architecture of the Britons, Anglo-Saxons, &c., be mentions that topera, ornamented with flowers, were used on high festivals to burn before particular images, and be borne in procession.

That wax-candles were not made in the Saxon period by That wax-candles were not made in the Saxon period by regular chandlers as now, appears from the description in Asser's Annala, translated for Bohn's Six Old English Chroacides, p. 84, of King Alfred's device for marking the hours of the day, by the consumption of wax-candles (six of which, lighted in succession, humed exactly twentyfour hours). It there appears that "he commanded his chaplains to supply wax in sufficient quantity, and he caused it to be weighed in such a manner that when there was so much of it in the scales as would equal the weight of seventy-two pence, he caused the chaplaius to make six candles thereof, each of equal length, so that each candle might have twelve divisious marked across it."

There can be no doubt, however, that the occupation of the wax-chandler existed in England at a very early period, as well for the mannfacture of tapers for religious rites, as for the preserving of the bodies of important personages in waxed cloths, which was called Cering Hence the nrt was probably practised chiefly, if them. Hence the net was probably practised chiefly, if non exclusively, in monasteries; the tenants of which paid several of the rents in kind, and one of these was delivered in wax, and called Cerage. The persons whose office it was to make this wax into paste and tapers were termed Ceragii and Ceraryi, and Decange shows them to have existed so early as a.n. 779. In 1397, John nf Gannt, have existed so early as a.n. 779. In 1397, John an Ganat,
Dake of Laneaster, directs by his will that bis body
should be carried direct to the Frian-Carmelites in Ficet Street, but that there should "be no cering or embalming of his corpse;" indicating that this operation was probably even then performed by ecclesiastics. In 1495, however,

Annal Tarit., iib. iii. e. 9. Edit. Lipr., p. 78, n. 21.
 Some examples of wax-candles, ornamented in this manner, are exhibited in the Russian Department.

a contemporaneous authority states that the Princess Elizabeth, daughter of Henry VII., "was cered by the Ducange shows that Casdelarii, or perwax-chandler." sons who made and sold candles, were known in the

middle of the thirteenth century.

By the sixteenth century the trade of wax-chandler was probably extensively established in England. In Brand's Popular Astiquities (vol. i. p. 29, Edit, Knight), is an extract from the chirchwarden's accounts of St. Martin Ontwich, London, under the year 1510:—"Paid to Randulf Merchaunt, wax-chandiler, for the Pascall, the Tapers affore the Rode, the Cross candelles, and Judas rapers arrore the Rode, the Cross candelles, ix, hijf. In the Memoirs of the last Theo Years of the Reign of Charles I., by Sir Thomas Herbert and others (p. 128), is described the night-light used in his chamber as "a cake of wax set in a silver basin, that then, as at other times, burned all night;" this description referring to the years 1646-1649 closely agrees with some of the forms of the modern mortar night-lights. Long coiled Wax-Tapers were manufactured in the 17th century in Venice, and the invention appears to have been brought to Paris about the middle of the same century by Pierre Blesimare, of that city,

In the year 1775, the Rev. Gilbert White, in his Natural History of Selbourne, pp. 198 and 199, 4to edit, describes the method of making Kushlights then practised by the cottagers of Hampshire, from which it might be by the cottagers of managainer, arom waters it might be inferred that they must have closely resembled those made by the nucleuts. A full abstract will be found in Tonalismon's Cyclopweita, p. 290, whence the following passage is taken:—"A pound of rushes (jacus), containing 1,600 individuals, was conted with 5 pounds. tallow, so that 228 lights weighed one pound, and cost a little over 5d. The rashes were peeled on three sides for the best lights, and on two only for watch lights, which were not required to give so much light, and which, Gilbert White says, 'it is true only shed a dismal one— 'darkness visible.'" Of the other kind he says, that "a good one, which measured 2 feet 44 inches in langth, hnrned 57 minntes;" and that he was assured by experienced old housekeeper that 11 lb. of rushes, after experienced on nonexeceper than 1 ½ in of transes, sitter having been coated with tallow, completely supplied his family for a year. The cost of lighting with rashes he estimated at one farthing for 5½ hours, whilst abalipenay candle in the "blowing" open rooms of the poorer cottagers only lasted 2 hours.

In the year 1799, William Bolts took out a patent in England for improving the form, quality, and use of the candle, the specification of which probably contains the first account of an attempt at the improvement of the quality of candles made from tallow and other animal fats, by subjecting the material to a considerable pressure during the act of cooling, and which, in effect, is the preparation of the so-called Stearine from fats. He likewise describes a solid candle with a short wick, which is placed in a bolder, and kept pressed on the end of the candle by a spring, or else the candle is placed in a tube and pressed against the wick by a spiral spring; as well as other contrivances, some of which have been revived

and successfully carried out in our own days.

The object of the preceding notices, incomplete as they are, is merely to enable the reader to form some idea of what may be gleaned relating to the various means of producing light at different periods, and especially regarding the construction and materials of the candle. Great interest, indeed, would be attached to a complete history of Domestic Illumination, tracing its gradual development from the solitary watch-lantern graven an the Pyramid, through the graceful hat very imperfect lamps of the Greek and Roman period, as exhibited in our museums, and the elumsy contrivances of the middleages, up to the productions of modern times, satisfying the demands both of taste and science. In such a narrative might be shown the progress of light, in the literal signification of the word, by a careful examination of the various forms in which it has been at different times employed, as lamp, lantern, torch, flambeau, faint or employed, as lamp, lantern, torch, flambeau, ramt or cresset, candle, and gas; whether for the celebration of religious ceremonies, for increasing domestic comfort,

adding to the scenrity of the streets of towns, or forming n beacon to guide the marine at night.* It would be, at in beacon to game the surror at night." A woman re, as the same time, a history glancing at the advancement which the improvements in illumination have given to the social condition of mankind; and at the advantages which science has derived from the study of this subject, Nor would entertainment or interest be wanting, in the recital of the many superstitions connected with the burning of lamps and candles; the shape of whose flame trembling in the moving air, and whose wick, bending or spreading under the influence of heat, has been suggestive to human imagination from the time of Pliny up to the enlightened days of our own century. Such an inquiry however, even were it possible with the time and the materials which are at the disposal of the Reporters, would far exceed the limits assigned to this Report. same restriction as to space prevents them from following step by step all the various mechanical contrivances which have been invented in recent times to facilitate both the manufacture and combination of candles. The Reporters cannot, however, refrain from entering into some details regarding the remarkable chemical improvements which have occurred within the last thirty years; especially since they possess the additional interest of being the result of investigations of a purely scientific character undertaken without any view to their ultimate practical application. In the present day it is too much the custom to require an instantaneous practical result, much to the detriment of the persevering prosecution of abstract science: the numerous, brilliant, and continually occurring oofs of that most important truth are too often overlooked, that all truly scientific studies tend to increase, sooner or later, not only the intellectual, but also the physical wealth of nations; and materially benefit the world at large.

(a.) Tallow-Candles.

The ordinary tallow-candle labours under many disadvantages, which are so well known that they scarcely require to be specified. It has an analessant odonr, which becomes more marked whilst burning; and the attempts at sapplying it with a self-consuming wick have been only partially successful on account of the law fusing-point of the tallow. The slightest draught, from the same reason, causes the tallow to melt in larger quantity than can be consumed by the burning wick, and it therefore gutters down; this renders the tallow-candle ill adapted for being carried about a house, as grease spots are apt to be pro-duced which are very difficult of removal; t to which we may add that it cannot be handled without soiling the

fingers.
The disagreeable smell of tallow-candles arises chiefly from the tallow being imperfectly purified; for if it contain a portion of the cellular tissue of the fat from which it is obtained, this putrifies and communicates the process of decomposition, like a ferment, to the fatty matter, which becomes rancid and evolves a most unpleasant odour. This is always the case with tallow as it occurs in commerce, which, although fit for the sospboiler, is too impare to be employed by the candle-maker without clarification. The first step towards the improve-ment of tallow-candles was made in the recognition of this fact; more attention was in consequence bestowed upon the manner of purifying or "Rendering" the tallow, as it is called. In England the "rendering" is effected by melting the tallow in an open copper pan exposed to the direct action of the fire. After it has remained in a fused urres account of the are. After it has remained in a fused state for some time, the water which the fleshy particles contain evaporates, and they then rise to the surface and are skimmed off and pressed. The pressed cake is called "greaves," or "eracklings," and is used for feeding dogs. Of the continues the surface of the pressed cake is a called On the Continent, however, D'Arcet's method is now naiversally employed, which has also been adopted in Ireland; it consists in treating the raw tallow melted by

* For a history of the "Lighting of Streets," the reader is referred to Beckman's Hist. Inc. (Bohn, vol. 11., p. 172.) † Common ether is one of the best vehicles for the dissolution and removal of oil or grease spots,

steam-heat with very diluted sulphurie acid, for the purpose of destroying the cellular tissue. This method, besides being much safer, yields three per cent, more tallow than the older process; and though it does not entirely remove the smell, essentially improves it. The purification of the tailow, at the same time, induces an melioration in the flame of the candle, more particularly in point of uniformity in the development of light; as the cause of the frequent obstruction of the wick during combustion by less combustible nitrogenous substances is

removed. Less success has attended the attempts to supersede sauffers, which still continue a necessary appendage to a candlestick with a tallow-candle. The plaited wick which, as we shall see farther on, followed in the wake of stearic candles, is not applicable to the tallow-candle without some special contrivance, as in carling over outside the flame (by which it becomes consumed) it causes the tallow to melt in such large quantities that a con-siderable guttering is the consequence. It is therefore necessary to protect the candle if a self-snuffing wick be employed; this is effected in Palmer's lamp. Here the candle is enclosed in a vertical metallic cylinder with a cap whose orifice is smaller than the candle; as the candle is consumed a spiral spring presses it upwards against the cap. This contrivance much resembles the plan prosave say. And contrivance much resemmes the plan pro-posed by W. Bolts in 1799, and to which allusion has already been made.

The next improvement in the tallow candle was effected by a reduction of the fusibility of the materials employed. This was first done by the same inventor, W. Bolts, but received farther development from Chevreul's researches. The observations of this celebrated chemist, to which we have already alluded in our article on soap, showed that all varieties of solid fats might be split into a solid ystalline fat (stearin and margarin) and an oily liquid erystatine intracectin mon imagazin; and an erystatine (olein); in his laboratory experiments this separation was effected by means of solvents; but subsequently it was found that by attending to the temperature of the fat, it might for all practical purposes be produced equally well by pressure. Common tallow melts at hetween 37"-40° C. (99"-104" F.) The melting-point of stearin is 62" C. (144" F.) By removing a considerable portion of the olein from the tallow, its fusing-point was conscof the orem town use taken, its manag-point was conse-quently raised, and thus a great evil removed. Candles have been repeatedly made of pressed tallow; they fairly deserve to be called stearin-candles, while those that now go by that mame actually do not merit the appellation.

To prepare stearin, tallow is melted and allowed to cool as gradually as possible, with constant agitation, so that

the stearin and margarin may erystallize; nt 35 to 38 °C, (95 to 100° F.) the mass becomes pasty, and is subjected to slow pressure in cloths. By repeating the operation, the stearin is obtained gradually of greater pority. Cocon-nat-stearin is very largely employed in England to mix with stearic acid, to form composite candles, the neutral fat appearing to be better adapted for this purpose than the fat acids which may be prepared from it; but on the Continent it is but little used

As regards the employment of tallow-stearin, many obstacles have stood in the way of its development which might, there is little doubt, have been removed by per-severing investigations, had not the more careful re-searches into the nature of the process of saponification of fats, and the separation of solid acids from the fatty bodies, the result of these researches, directed the inqui into a new channel. When it was found that stearie seid nato a new enament. When it was round that stearie assist fasing at 70° C. (138° F.) could be obtained from stearin fusing at 52° C. (144° F.), and margarie acid with a melt-ing-point of 60° C. (140° F.) from margarin fusing at 47° C. (107° F.), while the oleic acid remained as fluid as the olein from which it was derived, it became evident that the difference in the fusing-points of the solid and liquid acids being so much greater, the separation of the

* The American Section contains several specimens of olelo obtained by pressing lard, which, under the com-mercial name of lard-oil, is exhibited at Nos. 18, 19, 208, 562 former from the latter might be effected without difficulty. Thus the transition of the tallow-candle to the stearic candle was effected, Tallow-candles are of two kinds, "dips" and "moulds."

Dips are made by dipping the wick repeatedly in melted tallow; allowing a sufficient time to elapse between every operation, in order that each coat may consolidate.

Monid-candles are usually made in pewter moulds, although glass moulds have been lately introduced. The atthough glass moulds have been lately introduced. The mould cousies of two parts, a cylinder and a conical cap, which is perforated to allow a passage for the wick. Several of these moulds are fixed in a wooden frame, the upper part being formed like a trough in which the open end of the mould is inserted, the capped end pointing downwards. To insert the wick, the frame is lad on its side and a long wire with a book at one end is passed through the hole in the cap; the wick is then attached to the hook by means of a loop which is formed in it; on pulling back the hook the wick is drawn with it. A wire is now inserted across the top of the mould and through a loop at the other end of the wick; lastly, the wick is drawn tight through the cap, and a small wedge of wood is inserted to keep it in its place. The moulds are filled by running the melted tallow into the trough, sod are then allowed to cool until the next day.

There have been several improvements of late years in the mechanical arrangements for the manufacture of tallow-easiles, which it would be difficult to describe clearly without engravings; these have tended moch to lessen their cost, and consequently the consumption con-tinnes very considerable; still it may be expected, notwithstanding their moderate price, that they will be gradually superseded by the more elegant and harder candles of stearic acid, or of compounds of stearic acid with solid neutral fats, which have the advantage of being self-snuffing. As yet the general introduction of steario candles is impeded by their price, but we may confidently hope that the progress of science will soon afford us the ans of still farther reducing their cost of production and thus render the use of the tallow-candle less frequent in the dwellings of the poorer classes of society, as it has already disappeared from the homes of the middle

It is remarkable that the ordinary tallow-dip candle is not exhibited by any nation whatever, although there must exist far more makers of this kind than of any

ADSTRA

This is the only foreign country which has contributed tallow mould-candles. They are sold at 19 kreazers per Austrias, or 54d, per English pound; which is a half-penny more than far superior candles may be bought for in Ireland.

BRITISH COLONIES.

Two colonies, namely Nova Scotia and Van Diemen's Land, have sent monld-candles, in which there is, however, nothing remarkable.

UNITED KINGDOM.

The manufacture of tallow-candles in the United King-The manameture of fallow-candles in the United King-dom still continues to be a most extensive trade, not-withstanding the increasing consumption of gas, and the introduction of stearle and composite candles. Prior to 1831, when the day on candles was repealed, they yielded an important revenue in Great Bristian, as may be seen from the following statement (eep. p. 619). The day, It may be remarked, was first imposed in 1803, and continued at the same rates from that period until 1831, viz., 1d. per pound on tallow, and 3\frac{1}{2}d. per pound on wax or spermaceti candles. It did not extend to

In 1830 the number of candle-makers in Great Britain was 2,695, who paid 500,0481, 14s. 1d. duty; since the repeal of the duty no record has been kept of their number, but judging from the tallow imported, it cannot be less than in 1830.

the perfect parification of the stearo-margaric acid. If

we compare this proceeding with the present practice, we perceive that it had yet to pass through various ordeals, A formidable and unforeseco difficulty presented itself in the fact that the new stearic candles would not hurn with the ordinary wick; a long series of experiments were necessary in order to construct a wick which would not spatter the fat during its combastion. Chevreal and Gay-Lusuc succeeded in doing this in the course of 1825, and indeed the plan was specified in the English patent before spoken of; they endeavoured to seenre their invention in France by a rider to their patent, but this was not done until another inventor had taken out a patent for a

similar contrivance. A discovery like the separation of the fatty acids necessarily excited in many minds the desire for its practical npplication. Almost immediately after the publication of Chevreul's work, Cambacérès, an Ingriseur des Pouts et Chausses, appears to have directed his attention to the utilization of Chevreul's investigations; at all events he took out a bravet for the improvement of the wicks of stearic candles in February 1825, which was prior to the date of the rider to Chevreul and Gny-Lussac's patent in France, and that of Gay-Lussac's in England: the value of the patents of these chemists was therefore consider-ably reduced. Cambacérès' first plan was a hollow wick, but in Mny of the same year he patented the plaited and twisted wicks, hy which snuffers were rendered superfluons. The tension of the separate threads of the plaited wick caoses the portion which rises from the candle to euri outwards, so that its point projects beyond the flame, and is rapidly consumed in the air that plays freely around it.

Cambacérès had observed that the wicks soon becan elogged in the stearic candles, although this did not happen if they were used in ordinary tallow-candles; he ascribed this phenomenon to the formation of soaps produced by the action of the fatty acids on the carbonated alkali resulting from the combustion of the wick. Whatever may be the cause, he succeeded in removing the difficulty by treating the wick with dilute salphuric acid; he supposed that the presence of this acid prevented the formation of soaps by combining with the alkalics in the

Another essential improvement in this branch of indostry was brought about hy the introduction of the chesper material, lime, as a suponifying agent, followed np hy the decomposition of the lime-scap by dilute sulphurie neid. The merit of having successfully introduced pharie neid. The merit of having seccessfuty introunces, the saponification by Jime (asponification cellcuire) belongs to De Milly, who has carroed great praise by his contribu-tions to the stearic manufacture. His plan formed part of the original patent of Chevrenl and Gay-Lussee, and it redounds much to his credit that the brought a plan to bear which had failed in the hands of his illustrious pre decessors. The saponification by lime, in an industrial

sense, dates from 1831. scence, dates from 1831.

As the wicks were frequently corroded by the salphuric acid naed according to Cambacérés' preparation, De Milly, in 1836, took out a patent for employing the boxis, phosphate, or sulphate of anmonia, for the same perpose, These improvements, and the endeavours of De Milly to promote the introduction of the new branch of industry in other countries, gradually caused its extension.

Nevertheless numerous difficulties still remained to be

overcome. The limits of the present sketch will not permit us to do more than give the main features of the development of the stearie manufacture: we are unable consequently to trace year by year all the little improve-ments which have taken place; but we cannot avoid a short notice of the numerous experiments necessary to prevent the crystallization of the stearic acid during the monding of the candles. The first attempt made was to introduce another acid; and though successful in its immenuse ougest, the closese (areamona soci) was an anhappy | never worked.

Nearly faitness years later, on the 22nd August 1841, youthfol ast. It is true that this detections substance | Duberafinat lostation | a patient in England, and about the was added in very mininte quantities, yet it was entirely a sme time likewise one in France, for the particulation of incomposite with nearly, and as none prohibited in the first young and their desiribation. The plan groupes of the controlled by analomy, and in England you quality pore.

M. Duberafinat was to see the commone of the bullet. mediate object, the choice (arsenious acid) was an unhappy

erful public opinion. Here commenced all the manufacturer's troubles anew; in all directions he sought a substitute, and yet found none; at last, after innumerable experiments, and when almost driven to despair, he hit on two expedients—very simple when once found out— which answered as perfectly as the discarded plan. The means now employed are—the addition of a very minute quantity of wax to the stearic acid: a still more common plan is to allow the melted acid to cool down almost to the point of congelation before it is poured into the monlds, which are warmed to the same temperature as the fatty acids. The refrigeration and occasional stirring of the liquid fat produces a sort of liquid pulp, which congeals in the moulds without crystallization

Sulpharic suponification (Suponification sulfurique).—
While the steeric manufacture was gaining ground extensively, as we have indicated, a new art sprang np during the last ten years, having the same objects, and being based on the same foundations, but seeking the attainment of the goal by entirely different means—we speak of the saponification of fat by means of concentrated sulphurie acid, and subsequent distillation of the

resulting fatty acids. The urigin of this proceeding must undoubtedly be sought in Chevreul's work; still E. Frémy deserves the credit of having, in an important paper, perspicuously exhibited the relations of fats to sulphuric acid. He deexministed the reasons or tasts of suppliers cate. It ele-monstrated, in a treatise which he published in 1836, that the action of powerful acids on fatty substances has a close analogy to that of the alkalies. Both re-agents decompose the fat, but while the alkalies combine with the fats, and act the glycerin free, the sulphoric acid combines both with the acids and the glycerin; thus we combines both with the actos and the glycerin; lunk we obtain conjugate sulpho-acids, sulpho-tearin; sulpho-margaric, and sulpholeic acids, on the one hand, and on the other sulpho-glyceric acid. The first three are of a very ephemeral character; water decomposes them into slightly modified fatty acids insoluble in water, and sulphurfe acid, which, with the sulpho-glyceric acid, dissolves

in the water.

To George Gwynne is due the merit of having first described a method of obtaining fatty acids by the sulphinric saponification of neutral fats, and subsequent distillation of the resulting products. In a patent obtained in March 1840, he describes very fully his proposed plan for effecting this object, which consisted in distilling in ruces, by means of an apparatus similar to that employed in sngar refining; the difficulty of sustaining a good vacuum on the large scale was, however, found to present so many obstacles that the plan was subsequently abandoned. Mr. Gwynne proposed also to distil, in the same manner, fatty seeds obtained by means of lime-saponification, and even to obtain fatty acids by

in the water.

me distillation of neutral fats.

George Clark also directed his attention to the practical application of Frény's experiments. On the 5th November 1840, he took out a patent for nillining this property of sniphuric acid in decomposing fats, but without having recourse to their anhancement distillation. having recourse to their subsequent distillation: the difficulty in cost, however, of perifying the fat after decomposition rendered the attempt unsuccessful, ontwithstanding that the quantity of sulphonic acid proposed withstanding that the quantity of supports each proposed to be used was only one-fourth the weight of the fat, whilst Frémy employed, in his laboratory experiments, double this quantity. Farther experiments were still necessary to establish, on a firm footing, saponification by means of sulphoric acid, which ultimately again led to

the adoption of an improved system of distillation.

In the patent before mentioned, which Gay-Lussac took out in England, and which is distinguished by its comprehensive treatment of the question, the distillation of fatty matters is spoken of, and the remark incidentally made that the process is much accelerated by the presence of moisture; this part of the specification was, however, never worked.

temperature, and to pass steam through them, hy which means their disagreeable odorous principle was intended to be removed. The distillation of fatty bodies was also claimed by Dubrunfaut, but the chief object of his patent was evidently the purification of common oils. By decomposing the neutral fatty bodies in this way, acrolein is produced, the vapour of which is so pungent and irritat-ing, both to the eyes and the throat, that no workman can be found to endure it; hence this patent was not successfully worked, yet it contained a germ, which in the hands of Jones, Wilson, and Gwynne, was elaborated into the

of Jones, Wilson, and twynne, was emborance must use art now precision.

In an English patent, dated the 8th December 1842, and granted to William Coley Jones and George Wilson, we find the first application of the combined process of sulpburic saponification and aroma-distillation. They decompose fam with sulpburic sacid, sided by heat, and distillation of the compose fam with the process of the compose fam with the compose fam wi the fat thus decomposed by means of steam, which passes in minute streams out of a perforated coil fixed in the bottom of the still.

This combination of the sulphuric saponification and subsequent distillation solved the fundamental conditions of success; nevertheless a whole series of improvements followed, which essentially contributed to establish the present extension of this system of manufacture. Patents taken out by Gwynne and Wilson, on the 16th

November 1843, and on the 28th December of the same year, secured to them farther improvements in this process; in the latter a method is described of reducing the quantity of sulphuric acid employed for decomposing the fats to from 10 lbs. to 6 lbs. for every 112 lbs. of fat, that is, to one-sixth, and even to one-tenth of the quantity emplayed by Frémy in his investigations. This saving was effected by heating the fat to 177° C. (350° F.) Another improvement was the heating of the steam in a series of pipes after it had left the boiler, instead of depending on the temperature of the fat to effect it.

Their last patent on the subject is that of the 30th Oc-Their last patent on the subject is that of the 30th Oc-tober 1844, in which they propose to nee a jet of super-saturated steam* to heat the fats previous to sniphuric seponification. These patents embody all the plans which, since July 1844, have been in operation at the works of Price's Candde Company at Vauxhall and Battersea, of which Mr. Wilson is the managing director. Similar manufactories, though not of such magnitud

Summar manunctories, using not or such magnitude, here been established in other countries; the principal are those of Masse and Tribouillet, at Neallly, near Paris, Motard in Berlin, Bert at Gjoin (Spain), and of the Milly Candle Society in Vienna.

There can be that little doult, after inspection of the candles in the Exhibition, that the process just described in applicable to the production of the higher class of

candle, white, inodorous, and dry to the touch; but this is not the only part which it has filled up to the present time, it is in the treatment of palm-oil and chesp fatty bodies that it renders most valuable service. By its aid fats the most fortid and impure furnish candles of the finest quality; and thus it utilizes the waste of the ginemaker, and oily residues derived from the waste lyes of woollen and other manufactories, We now proceed to describe the practical processes of the workshop, the various stages of which will be followed

without difficulty after what has been said in the article on soap, and in the foregoing sketch respecting the constitution of fats and their decomposition.

(c.) Description of the Lime Process as practised at Messrs.
Ogloby and Co.'s Works at Lambeth.

Saponification.- Into a large wooden vat, containing a coil of steam-pipes, pierced with small holes, ten tons of when turned on, issues through the holes into the water, raises its temperature, and melts the tallow; as soon as the water has entered into brisk chullition, a quantity of lime, in the state of thin cream, is added, and the chullition continued for six hours, or until complete saponi

. Steam heated to a higher temperature, after it has left Team nearest to a more compensate, have it has re-the boiler, than it can soquire if kept in contact with the water from which it is generated at any given pressure.

fication is effected. From 10 to 15 parts of dry quick-lime are added for every 100 parts of tallow. The lime decomposes the tallow and combines with the resulting stearic, margaric, and oleic acids, forming a lime-scap (rock-soap), and sets the oxide of glyceryl at liberty in its hydrated state as glycerin, which dissolves in the water. The whole is allowed to cool in the vessel in which the boiling is effected, and the solution of glycerin run off.*

The rock-soap, when cold, is reduced to a coarse powder by a mill, consisting of a pair of finted rollers, over which an axis is placed, carrying tiger-like claws, which revolve between a series of horizontal prongs. The claws, by an axis is placed, carrying tiger-like claws, which revolve between a series of horizontal prongs. The claws, by passing between the prongs, tear the large lumps into small pieces, which are then crushed by the fluted rollets. Decomposition of the Line-scope by Acid.—The ground lime-scop is now placed in lead-lined vair, supplied with

a perforated copper steam-coil, each vat being capable of a permitted copper steam-con, each van teng capanie or holding from eight to ten tons. When the temperature has reached the boiling-point, sulphuric soid, previously diluted, is added in the proportion of about 25 parts to every 100 parts of railow employed. The sulphuric soid combines with the line, forming an insoluble sulphate of lime, and liberates the oily acids which float at the top, and are then termed "yellow matter," This yellow and are then termed "yenow minur. Ans yenow matter is run off by cocks, placed at the proper level, into large sponted vessels, called "lacks," and poured from these into flat tin-moulds, in which it is allowed to cool and crystallize.

The sulphate of lime, after being well washed with boiling acidulated water to remove the adhering fat, is sold as manure.

Pressing the Fatty Acids to resove the Oleic Acid.— The cakes of yellow matter are interleaved with cocon-nut mats (without being sliced and enlosed in bags, as was formerly the case), and subjected between iron-plates to a pressure of 600 tons in a vertical hydraulic press.
A great portion of the oleic acid is thus removed, and the mixture of steario and margaric acids rendered much Refining.-The cold-pressed acids are then melted by

steam in a lead-lined wooden vat, with a little dilute sulphuric acid, to remove any oxide of iron, or other impurity; poured into flat tin trays, and again allowed to cool and crystallize. Hot-pressing.-The cakes of stearic acid, when cold

re put separately into a linen-bag, interleaved with cocon-nut matting and iron-plates, previously heated by steam, placed in the trongh of a horizontal hydraulie press, which is likewise heated by steam, and then subjected to great pressure for some time. By this operation the remainder of the oleic acid, holding a little of the solid acid in solution, is removed. The pressed cakes retain a small quantity of oleic acid at the edges; these are seraped off, melted, and again pressed. Second Refising.—This process is simply a repetition

of the first process of refining. Monlding .- In the mann facture of the best description of stearic candles, the moulding is generally performed by hand. The moulds are of pewier, several being fixed in a wooden frame; these moulds are heated to a

temperature approaching the fusing-point of the steeric acid, and are rapidly wicked, in the manner already described in speaking of tallow mould candles, The wicks are all previously prepared by immersion in a solution of boracic acid, or the ammonia-salts of this and other acids, the preparation varying with the ex-perience of different manufacturers. This preparation, called flux, serves to fuse the ashes of the wick into

minote globules, which are frequently seen on the ex-tremity of the wick, and which are readily dispersed, and also prevents the formation of earthy and alkaline scaps.

The melted material having been allowed to congcal to

* Until within the last four years the glycerin was a vabuckets predont; its utilisation is due to Mr. Thomas Da La Rue, who, heing engaged in experimenta on its applica-tion in the arts, happened to observe its property of allevi-ating any irritation of the skin, and suggested to a medical friend its use in the treatment of cutaneous affections.

a great extent, is run into the moulds. After cooling, the candles sbrink sufficiently to be removed with a few light

taps on the frame.

The fusing-points of stearic candles are remarkably aniform, though manufactured by various makers in different countries; for example, those taken from Mesers Ogleby's case congested at \$5°*25 C. (131'.5 F.), and one from De Milly's at \$5'*50 C. (132' F.) This coincidence is very remarkable. Stearie acid fuses at 70 °C. (158 °F.) Margarie acid at 60 °C. (140 °F.) So that from the mixture of the two a compound is formed which fuses at a lower degree than either of the componeots, for it is almost impossible to assume that the solid acid should still contain a sufficient quantity of oleic acid to reduce its fusing-point to such an extent,

(d.) Description of the Sulphuric Saponification and Distillation Process employed at the Works of Price's Patent Cardle Company.

Sulphuric Suporification.—About 20 tons of fat, say aim oil, are placed in a large lead-liced vat, and fused by a steam-jet. The fluid mass, after being allowed to settle, has now to be exposed to the combined action of concentrated sulphuris acid and heat, and for this pur-pose is pumped up into the acidifying vessel, in which its temperature is raised to 177° C. (350° F.) The means of heating is a jet of low-pressure steam, which, in its course from the boiler, passes through a series of iron course from the bouter, passes through a seriest of iron pipes heated in a farance. The quantity of acid used is in the proportion of 6 lbs. for 112 lbs. of palm-oil. Ju this operation the palm-oil is decomposed and becomes much blackeued. Withdrawn at that period it is seen that an important change has been effected by the action of the acid, as the mass now readily crystallizes to a tolerably solid fat. The fat is now drawu off from the acid and transferred to the washing tank, where it is boiled up with water hy means of a steam-jet, Distillation,-Afer one or two washings the blackened

fat is withdrawn and pumped up to the supply tank, which commands the stills. The stills, which are made of copper, are heated by an open grate; each still is capable of holding five tons of fat. When charged, the temperature is raised to 293° 5 C. (500° F.), and low-pressore steam passed through the mass; this steam is

previously heated by passing through a system of iron pipes placed in a furnace.

The correct of steam carries with it the vapour of the fatty acids, and thus facilitates the process. vapours of fatty acids and water pass together to a series of vertical pipes, which retain a temperature abova 100° C. (212° F.), where the fats only condense while the steam passes to a second refrigerator, cooled by a corrent of water; here it is condensed along with the minute quantity of fat curried over hy it. A separating tank, from which the water escapes at the bottom, whilst the fats float on the top, serves to recover this small

quantity.

Distillation of the Residue—After continuing the distillation for a certain period, the residue in the still is transferred to another still formed of iron pipes, set in a furuace, and there submitted to a much higher tempera-ture, and a jet of steam more strongly heated. The residue left in these iron stills is a sort of pitch, and is applied to the same uses as ordinary pitch; by this means an additional quantity of fatty acids is obtained.

The fatty acids, as they run from the still, are used to a great extent for the manufacture of candles without pressing, and form what are called Composite candles. which possess all the advantages of being self-snuffing, hat are more fusible and softer than the pressed steuric

acid candles. A large proportino of the distilled fats, however, is pressed to make n better sort of candle, and for this pur-

Press to high a bresses are employed.

Cold-Pressing.—The fats are spread by logenous machinery on woven mats, and submitted to powerful cold pressure, between iron plates; the oleic, or metoleic acid, runs out, and is collected, and chiefly exported to ermany, where it is employed in soap-making distilling palm oil, if

subjected to hot pressure, in hydraulic presses, confined in a chamber heated by steam. The pressed cakes, after the removal of the edges, are melted in contact with a little diluted sulphuric acid, and run into blocks. When the Reporters visited the works, the Company were distilling at the rate of 130 tons of palm-oil per week.

Moulding.—The moulding of the cheaper descriptions of candles is effected by ingenious machinery invented by Mr. Morgan, of Manchester, and improved by the engineer of the Company. By this machine 18 candles are moulded at one time; the wicks, 60 yards long, are wound on 18 separate reels, one for each mould. As one set of candles is pushed out by a series of plungers, they draw with them into the moulds the wicks for the next lot; these wicks being held temporarily with one clip, whilst the candles are held with another, are cut of close to the candies by a traversing circular cutter. Compound forceps, having 18 bolders, now seize the wicks at the open end of the moulds, and hold them in their places; the plungers then return and draw the wick tight, moulds, which during the operation have remained in a horizontal position, are now turned in a vertical direction, the small end downwards, and are then passed on a railto the proper temperature by their transit through a bot closet. They are then passed to other parallel railways and left to cool: after remaining a sufficient time to allow of the solidification of the candles, the moulds are brought back in succession by means of turn-tables to their first position. The forceps (which during the moulding have remained in site) are now removed, and the frame of moulds again turned in a borizontal position, the trams or moulds again turied in a normontal position. Eighteen plangers or pistons are made to press forward the loose bottoms of the moulds which correspond to the small end of the candle, in pushing these forward the candles are pressed out, and thus the cycle of operations is completed. It must be added that the return-troke of the piston brings back the bottoms of the moulds against shoulders provided to keep them from falling out.

Pressed cocca-nut oil is largely employed to mix with the pressed acids of palm-oil to make the best composite

Price's Candle Company (Class IV., 83, p. 201*) is the most colossal establishment in the world in this branch of chemical manufacture; possessed of five distinct manufactories, besides plantations of eocoa-nut trees in Ceylon, of a capital but little short of half a million sterling. or a capital our uses hord or nair is mannes serrang, and employing, nowthist-anding the best arrangementa for economising labour, 800 weakpeople; it is not sur-prising that they divide annually in profits a sum equal to the gross returns of some of the largest continenal weeks (between 40,000, and 50,0001).

werss (tetween 40,0004, and 50,0004).
The finsing-point of Price's Candic Company's candles of pressed dataliled flats obtained by distilling palm-oil is 51°-3. C. (124° F.); those prepared from the pressed flat obtained by distilling Chinese tallow (derived from the Stillingia subjects), seconding to a patent taken out on the 20th of December 1845, by Wilson, Gwymne, and Wilson, fast or 57°-7 C. (1086).

In the Austrian Department there are Four Exhibitors In the Austrian Department there are real Exhibitions of stearic caselles, whose productions are generally of the highest character. The two principal are, firstly, the Arollo Corlarny (39, p. 1009), which is the largest establishment in that country; having two manufactories, and employing about 600 workmen. These works producing the control of the country is the country of the country is not only the country of the country is not only the country in the country of the country is not only the country of the co duce about 1,000 tons of stearie enodles, and 1,500 tons of duce anout i, out one of recent endesor this Company are soon, annually. The stearie candles of this Company are the whitest in the Austrian section. Secondly, the MILLY CANDLE SOCIETY (40, p. 1009), which was established in 1837, with the aid of M. de Milly, who instructed his brother in the cur, and sent him to Vienne for that pur-pose. They have two manufactories, giving work to pose. They have two manufactories, giving work to 200 people; they also employ machinery for moulding. In the one they produce, by the lime-process, 500 tons of candics, and 450 toes of soap, annually; in the other, they employ the distillation-process, and produce, by distilling palm oil, 300 tons of eandles: in all, 600 tons

According to Mr. Buschek, the total annual value of the stearie mannfactures in Austria is between 5,000,000 and 6,000,000 florins (428,572/, to 514,286/,); this inelindes the soap made as a secondary product from the oleie acid. Tallow costs 29a. per English ewt., and is reckoned to produce 45 per cent. of steario acid, and 45 per cent. of oleie acid. Stearic acid sells at 66a, 3d. per cwt., and the manufactured candles at 112s, per cwt., which is an extraordinary advance on the price of the acid. Oleic acid sells at 18s. per cwt., and oleic acidsoda soap at 25s. per ewt.

BELOTUM.

The manufacture of stearie candles was introduced into this country by De Milly, in 1833, and has since

attained a high state of excellence.

The mannfactory of C. and J. QUANONNE (431, p. 1164), (who exhibit) was established with his aid; and they have adopted his name, of Bospies de l'Eule, for their cardiar. They have a They have six hydraulie presses, and produce annually about 240 tons of stearic candles, 70 tons of

annually about 240 tons of stearic candles, 70 tons of which are exportable. Exhibitory of enable from Belginn, via: —Discretaric transfer and Exportable (1997), 1167), who compley 17 workness, and produce 80 tons of stearic candies, 50 tons of which are caported; and Cirazzov xx was only established in April 1809; they nevertheless have sent the finest speciment. At present they are producing at the rate of about 50 tons per names.

The wholesale price of stearic candles is from 10d, to le. per lb.

CANADA.

The stearie candle manufacture has extended to Canada; which contributes the productions of a single mannfactory: from what has been sent it is fair to anticipate that this art will soon be perfected.

There is only one exhibitor of stearic candles in the Danish Department; his productions are very high in price (1s. +)d. per lh.), a natural consequence of the high rotective duty of 27s. 6d, per ewt. on candles imported. At present Mr. Holmblad's works (27, p. 1357) are on a vary small scale, producing only 20 tons of candles per There are, however, two other manufactories established near Copenhagen.

As the steario manufacture was originated in this country, it was to be expected that there would be many Exhibitors representing this art, and that their produc-tions would be of the finest quality, an anticipation which is confirmed by the result, for there are six Exhibitors of stearic candles by the lime process, and one of stearie candles by the sulphuric process, most of whom have been rewarded. There is likewise one Exhibitor of ornamented candles, which are, however, unimportant. M. De Milly (644, p. 1209), who was the first to apply the lime pro-cess successfully, established his manufactory of stearic candles in Paris in 1831, and gave the same of Bosyies de l'Etoile to his products, because it was situated near the Barrière bearing that name; his manufactory now produces, on the average, 2 tons of candles per day. Since that period many other makers have sprung up in France; and there are now in Paris and its environs six makers besides De Milly, who collectively produce, at the least, 10 tons per day by the lime process. Besides the least, 10 tons per cay ny toe lime process. Denues which there are in the French provinces seventeen other manufacturers, who make collectively about 17 tons per day. These figures must only be taken as approximations; but they show, that in France alone, at least 7,400 tons of stearic candles are produced by the lime-asponishment of the process of the produced by the lime-asponishment of the produced by the produced by the lime-asponishment of the produced by the lime-asponishment of the produced by the produced by the lime-asponishment of the produced by the produced by the lime-asponishment of the produced by the produced by the produced by the lime-asponishment of the produced by the produc

costs or scarre cames are pronounced by the imme-saponing-cation process. Besides these, Masses and Trainoviller, who employ the processes of sulphurie saponification and distillation, are mounted to distil about four tons of fat per day. They have exhibited a series of most

interesting products, which are described in the List of

According to a statement furnished by Masse and TRIBOULLET (1346, p. 1240), the whulesale prices of the various stearie manufactures are as follow:-The best steario candles, 11d. per lh.; second quality, 10d.; third quality, 9d.; candles made from unpressed distilled fat quarty, 9d.; candles made from unpressed distilled fat acids (composite candles) 7da, 8d., and 8d. per lh., ac-cording to quality; grease recovered from waste sads, 2d. per lh.; and, satly, paraffin-candles, i.e. 8d. per lh.; hat it does not appear that they have yet been supplied in the way of trade. Candles exported from France in 1850:-

HOLLAND.

Mr. Brandon (70, p. 1145), who has sent very beau-tiful productions, established his works in 1839; he employs two steam-engines, five hydraulic presses, and about 100 workpeople.

Excellent steario candles are sent from Cossypore (p. 922). Ceylos (p. 937) has contributed specimens of cocoa-ant stearin and olein.

M. Motard (Zollverein, 262, p. 1063) was selected as the only exhibitor to represent Germany in stearie ma-nnfactures; and his articles fully justify the choice of the local authorities. M. Motard exhibits candles made the local authorities. M. Motard exhibits candles made by distillation as well as by lime saponification. The wholesale price of steario candles in Berlin is 1s, 04d, per pound avoirdupois: of stearie acid, 1t 4d, per lb.; of candles made from the napressed distilled acids of palmoil (composite candles) 8d, per lb.; and of the amenical callet. 3d over

the unpressed acids, 7d, per lh. In 1846 there were sixty-nine manufactories of scap eandles, and oils, giving employment to three hundred and fifty-five artizans; also five establishments for waxhleaching and wax-candle making, employing thirty-two

workmen.

Preses. There are Five Exhibitors of stearic candles in the Russian Department, whose productions are most ere-

Russia possessed, in 1842, sixty-two candle-manufac-tories, which produced annually goods valued at 142,800 L; and two hundred and sixty-six tallow-melting establish-

ments, which yielded tallow valued at 1,578,000/, The price of stearie candles in Russia varies from 10d. to 101d, per English pound.

SAUDINTA

There is One Exhibitor of sterrie candles from Sar-

SPAIN.

In 1839, while the effects of the civil war which paralysed Spain for some years were still severely felt, M Julian Bear (246, p. 1344), nided by M. de Milly, had the courage to establish a manufactory of steario caudles the corrage to extend a manta-cory of stearre custures in Spain. The difficulties of in ducing capitalists to join in forming a company being over crome, M. Bert had still to contend with formidable obstacles, from the discontinuance, at that time in Spain, of several collateral branches of industry. He was obliged to erect leaden chambers, and manufacture his sulphuric acid; also to establish a cooperage and a boils -making shop. In spite of these obstacles, his efforts were so successful, that, since that period, his Company have established still more extended works at Gijon, where saponification and distillation are both practised; as well as soap-making on a very large scale. The distillation furnishes 3,500 lbs. of vegetable futly acids per day. One hundred and fifteen workpeople are employed in the two establishments; they are all Spaniards, and were instructed at the works, There are two other manufactories of stearic candles, one at Barcelona, the other at Hernani. The wholesale prices of tallow and palm stenric candles are both 1s. 3d. per pound avoirdupois,

SWEDEN AND NORWAY.

Some of the finest stearic manufactures in the Exhihition are sent by J. Johansson, of Stockholm (98, p. 1354). The beauty of these productions arises chiefly from the employment of newly-invented machinery, which this Exhibitor obtained from J. and C. G. Boli der, engineers in the same town. Several candle-moulds exhibited which are remarkable for their internal polish. They are made by simply dipping a cold highly-polished steel-rod into a melted alloy, chiefly composed of tin. In this way two workmen can produce from 100 to 110 moulds per hour. M. Johansson enploys a steam-engine of twelve-horse power to work the hydranlic presses, slicing and mixing machines, and also a polishing machine, to which the great lustre of his candles is partly

TURKEY.

Moldavia contributed some very good specimens of stearic candles from its only manufactory, which pos-sesses a steam-boiler and two hydranlic presses; and produces about twenty tons of candles per annum,

UNITED KINGDOM. In 1832 a manufactory of stearic candles was esta-hlished in London, with the co-operation of M. de Milly;

nud in 1833, M. Burjot introduced them into the market under the name of moulded wax. In 1834, W. S. Hale (p. 796) commenced working, and has from this period gradually extended his works, until he has become one of the largest makers of stearie anti ne ma neconar one of the interprocess. His aim beiler the manufacture of a commercial article in large quantities, the productions which he contributes have not the whiteness and high degree of finish of those of some

other Exhibitors. It was likewise in 1834 that C. Outenv and Co. (p. 797) commenced working. They have since devoted them-selves almost exclusively to the highest articles, and their stearie acid and candles are the whitest in the World's Show.

Soon afterwards J. C. and J. FIELD (p. 205*) commenced the manufacture, and have likewise directed their attention successfully to the best class productions.

The manufactory of M. Burjot is no longer in existence, but has supplied the foremen employed in the first

instance in the works of the three Euglish exhibitors. instance in the works of the three English exhibitor. The wholesale price of stearic cashids in England is 10d. per th., and that of stearic said 3d. per the Besides those just named, PRICE'S CANDER COMPANY (p. 2017) exhibit interesting products obtained from the distillation of flus; and Mr. Hauwers, the flat scide reco-

vered from waste lyes. The wholesale price of palm steerie candles in 91d, per

th., and that of composite candles 54d, per lb.
Imports of palm oil into the United Kingdom in 1850;—

In 1850, 4,672 lbs. of stearie candles were imported into the United Kingdom, and paid 24l. duty. This quantity is very insignificant compared with the annual consumption, and arises in a great measure from the chespness of production in England: another cause, however, is the preference shown by the British public for candies coloured yellow to resemble wax, which descrip-

tion is not manufactured in other countries. It is much to be regretted that this tendency to imitate one material by another should prevail to the extent it does, as it un-doubtedly frequently retards the development of each in its own particular sphere. Many instances might be cited in illustration: the imitation of a caroct or marble payement by oil-cloth, and chintz and silk by paper-hangings, immediately occur; to which we may add, as more im-mediately connected with the subject under discussion, gas hurners made to imitate oil lamps and candles, as if a tube conveying gas could not be arranged in an orna-mental form. But to lower the beautiful white of the are stearic candle by any contamination appears absurd, pure stearic candle by any contamination appears anount, after bestowing so much skill in obtaining it free from colour. Our French neighbours, who, in matters of taste, are at least our equals, have long since discarded the less luminous wax candle, and invariably use those of pure white stearie acid for their grand fittes. The Jurors lately witnessed a brilliant illustration of this fact in the gorgeous illumination of the Hotel de Ville at

WURTENBURG.

Although the name of one manufacturer is given in the Illustrated Catalogue, no stearic candles are exhibited in the Wurtemburg department,

We now come to the consideration of candles made from wax and apermaceti, These substances, though differing from fats properly so called, present some analogy; they are even more closely allied than the fats themselves to the class of bodies called compound-ethers, inasmuch as they are actually combinations of certain fatty acids with the oxides of various alcohol-radicals; for, whilst oxide of glyceryl is common to all the fats and oils before spoken of, the waxes and spermaceti have their own peculiar bases, which, when liberated, are (nullke glyceria) insoluble in water; moreover, waxes are (nullke glycerin) insoluble in water; moreover, waxes are only partially acted upon by weak solutions of alka-lies, and spermaceti not at all under ordinary circum-stances; and although they may be split up into their proximate components by fusion with the solid hydrated slakalies, or boullition with their very concentrated solutions, they must be considered as non-suponifiable in the ordinary acceptation of the term. The individual differences of wax and spermaceti will be farther elucidated as we proceed.

(e.) Wax-Candles,

Under the name of wax are included substances of various origin and of very different composition. wax employed in the manufacture of caudles is secreted wax empoyed in the manufacture of calcules is secreted by the honey bee, which has the power of producing this substance from its food (angar). At one time it was thought that the bee collected the wax ready formed from plants, until Liebig advanced the contrary opinion, which was subsequently corroborated by the experiments of MM. Dumas and Milne Edwards.

A wax known as Chinese wax, and resembling s maceti in appearance, was formerly supposed to be a vegetable wax; but the researches of Sir George Stanatou and M. Stanislaus Julien, have demonstrated that it is the secretion of a male insect, the Cocus ceriferus. which deposits it on the trees on which it feeds, particularly the Rhus succedaneum. t Wc owe to Mr. Brodie, a knowledge of the true chemical composition of wax.

• The attention of the reader is directed to the following specimens of wax obtained from different sources, and which are hut little known. Two examples (275 and 295) of beer -wax from Tanmania, in the section of ion Dienare's Land; berry-wax and beer -wax from Sad Agries; vegetable wax from S. Domingo; and is the Chance section a so-called vegetable, wax produced in Sacchallen, and also white and yellow bees'-wax.

† For much valuable information respecting the so-called

1 common variance information respecting the so-tailed vegetable waxes of China, as well as the other products of that wast ampire, the reader is referred to the Etnak Pratique du Commerce d'Expertation de la Chine, by our colleague, M. Natalis Rondot, Paris, 1819. Guillaumin.

This clemint, by his recent claborate researches, how show that Chaines was in composed for peculiar farty scale (creative) and the oxide of an adoubte radical scale of the control of the control of the control of the control of the creative and the control of the control of the creative and the control of the control which is nearly insoluble in adoubt, and which has been usually called myrich, he has show to be a composal which is nearly insoluble in adoubt, and which has been usually called myrich, he has show to be a composal condision, the control of the control of the control of missipal, that is, pulmation of control on emissipal. He has like view been able to prepare from wax two new saids and insulate to pranting.

Paraffin would be much too costly to be converted into candles if made from wax, as its preparation entails a considerable loss of material; it is, nevertheless, desirable that it should be obtained cheaply from some source, as it is much better adapted than any other substance for illuminating purposes, from its containing no element besides carbon and hydrogen, which are united in equal equivalents; it is, therefore, exactly of the same com-position in a hundred parts as olefant gas, which gives to ordinary coal and oil-gases their illuminating power. Examples of paraffin-candles are exhibited by Masse and Tainouiller in the French Section, which were made from paraffin obtained by distilling hituminous schist: but far more interesting specimens are sent by JAMES YOUNG, Class II., No. 74, which seem to realize the great problem which the rare sugacity of Liebig* pointed out as far back as ten years ago. "It would certainly be as far back as ten years ago. esteemed one of the greatest discoveries of the age. says he, "if may one could succeed in condensing coalgas into a white, dry, solid, odourless sobstance, portable, gas into a winte, try, total, sucurress somastice, portaine, and capable of being placed upon a candlestick or burned in a lamp. Now this wery problem Mr. Young appears to have accomplished by distilling coal at a comparatively low temperature, whereby he obtains, instead of gas—the product of intense leat—a mixture of liquid and solid substances, the former capable of being harned in lamps like sperm-oil, or of being used for lubricating to tamps are spermen, or a comparation mould-candle as solid and white as any prepared from paralliu from other sources. The Reporters have not, as yet, been able to obtain a fuller account of the economical hearings of Mr. Young's process,† which will most likely be considered in the Report upon another Class, but they confidently hope that this truly beautiful discovery will not meet with similar difficulties as the plan prope some years ago for making paraffin-eardles out of If coal-paraffin can actually be obtained in sufficient quantity and at moderate cost, we may witness another revolution in the processes of illumination; and the brilliant discoveries of Chevreal, but Intely threatened by the spleadour of the electric light, may be celipsed by the general adoption of solidified coal-gas candles. In most countries wax intended to be made into enables

is periously blenched by a process personally to be decribed. That this, however, in and always the case, we reduced. That this, however, in the always the case, we reduced to the control of the control of the control Control. The enables in the latter, which we may late vax. "Jup", and have a very usually appearance. The remaining control of the control of the primitive method usually adopted for their material terms contains under the control of the control of the control of the deed in the province of Kirwan, and the primitive method usually adopted for their materials the primitive method usually adopted for their materials are control in the small mode, the wax is sometimes blenched, and of the usual mode, the wax is sometimes blenched, and of the manufacture of caselles, although sterie cannilles of Competing annual terms of the control of the deep control of the control Wax is more valuable when hleached, not only on account of the greater heauty, but also from the removal by this operation of impurities which would eliog the wick during combustion. It may be bleached by chlorine, but the process is of no value, because its constituents remin a portion in combination, and hence hydrochloric acid is given off in harming.

The method of bleaching employed is very simple, although tedious; the following, with some trilling varia-

tions, is the plan adopted in most countries.

War Blacching.—The war is cut up into numal pieces
and placed in a var, into which steam is made to pass

quires also frequent turning, so as to present every portion to the bleaching agency of santight.

The fusing-point of wax is raised by bleaching, for yellow wax fuses between 62° and 63° C. (144° and 146° F.), and bleached wax between 64° and 65° C. (147° and 149° F.).

(All most few as a condition of the cond

Notwithstanding the difficulty with which Gambia wax is blenched, and its linking to become of a rusty brown, that country furnishes the greater part of the wax which is imported into Great Britain. Large quantities are likewise imported from Megadore, the East Indies, particularly Ceylon and Singapore, and North America; the Mogadore wax is frequently largely adulterated with file.

been seen that it carious wax has been imported, the product of a black bee, which hives under ground. It is soft, and exceedingly remotious, and of a dark mahagan; and of the careful product of the careful

be imported, but no use has sey et been found for it.

The English wax is the most esteemed of all, but the small quantity produced is absorbed for various purposes without blenching, on account of its fine quality and its brightness and fragrancy.

In 1850 the quantity of bees'-wax imported for home consumption in Great Britain was 10,761 cwt., besides a small quantity of vegetable wax amounting to only 5 cwt. There is no duty on wax.

"The attempt to bleach war by meson of childrine, although meson fall in a practical point of view, has been very fertile in the state of the state of the war between the state of the state of the besiling views in chemistry, the so-called theory of substitution, derived its origin from Gay-Lusses' observation, that war, when exposed to the action of chiorian, also rised this element into its composition, relevaning an equivalent quantity of hydrogen in the form of hydrones are the state of the

^{*} Familiar Letters on Chemistry, 3rd edition; Letter XII.,

[†] According to a statement furnished to the Reporters, 100 parts of cannel-coal, from Bathgate, yielded 40 parts of oil, and 10 parts of paraffin.

1,067 lbs, of wax candles were also imported and paid 9l. duty.

Wax is not well adapted for monkling on account of its tendency to adhere to the mould, and its great contraction in cooling; and though these difficulties may be overcome, yet it is found more advantageous to make wax-candles in the manner about to be described, as they are found to hum much better.

The first process consists in warming the wicks in a stove, and then suspending them to a hoop placed over a vessel of melted wax. The workman pours the melted wax with a ladle on to each wick in succession, and at the same time causes the wick to revolve on its axis by the motion of the fiagers; when the candles are about one-third made, they are allowed to cool for a time, and the operation of pouriog repeated until the eandles are about half made, which is ascertained by the eye or by weighing. Whilst still warm, they are removed from the books and subjected to a process of rolling between two murble slabs, so as to render them uniform in thickness. The upper end of each candle is now formed by cutting down the wax to a metal tag which covered one end of the wick. The camiles are then again sespended to the hoops, the end which had previously hung downwards being now apwards; and the operations of basting and rolling repeated as often as necessary. Lastly, the lower ends of the candles are cut off to make them of

equal length.
The wicks of wax-candles are always made in twisted unbloached Turkey cotton, the fiftee of which appears better to resist the temperature of the highly beated wax during combustion. Platted wiels are not adapted for awax-candler, as the platting, by thininishing the equilibry and the platting of the pl

of soot. The large wax-endles, used in churelwe, are formed by laying the wick on to a slah of wax, which is there are large wax-endles, which is the Long wax supers are made by wisoling the wirk un a drum, and then leading it under a geinler-roller, placed in a trough of melded wax; from this it passes through a critic of holes, progressively mailler, that a drum are large with the state of
wax pliable enough to wiod,
Wax candles are coloured with the following ma-

Hlue - Artificial ultramarine.

Green - Mixture of verdigris and emerald green, or verdigris only.

Yellow - Chrome-yellow.

Red - - Vermilion.
Pink - - Madder-lake.

Wax mortar-lights, which are used as night-lights, have wicks of flax, as cotton is not found to be so well adapted to resist the long-continued action of the high temperature, and is not so noiferm in its capillary

nction.

The larger mortar-lights have plaited wicks, and are used principally for warming dishes.

CHINA-

The Chinese employ beed-wax, the insect-wax before reports of an disto vegetable tallow (chained from the property of the contract from the property of the contract from the contract from the contract from the manufecture of casalles. The insect-wax is particle by fitteration through moint free, and is then, for the propose of manifectuality, mixed with one-homborist part page of the contract from the Discourance of the Contract from the Bosourable East India Contract (p. 220), who called none cannot for the contract from the Bosourable East India Contract (p. 220), who called none cannot for wax-toper from the contract from the Bosourable East India Contract (p. 220), who called none cannot for wax-toper from the contract from the Bosourable East India Contract (p. 220), who called none cannot for wax-toper from the contract from the Bosourable East India Contract (p. 220), who called none cannot for the contract from the Bosourable East India Contract (p. 220), who called none cannot for the contract from the Bosourable East India Contract (p. 220), who called none cannot for the contract from the Contract fr

EGYPT

From Egypt are contributed a few specimens of waxcandles, some of unbleached and others of bleached wax, which must be characterised as crude manufactures.

INDIA.

The Indian Department contains some well-made short caudles of bleeched wax, six and nine inches in length, which are manufactured at Pstua. They are desiranted

eamphorated wax.

The most important contribution of that country in V, Sartzata's (200, p. 1307), which consists chiefy of wax lights, phin and ornamented, for the use of cluurches, though there are several for household use. Most of the other collections are small, and consist in some cases only of wax-twisted tapers. Two Exhibitors have seuf fancybaskets made of waxed wicks. In 1842 the wax produced in Itsusia was valued at 92,000!

Tunes.

This department contributes the most ungainly candles in the Exhibition.

TURKEY.

The Turkish Department contains specimens of very well-made and well-blenched wax-candles, and twisted tapers. The Jury have included these in their Award to Ilis Humanss the Suktan, as in common with most of the articles exhibited, they were bought in the bazzars, and no individual Exhibitor's name was given.

UNITED KINODOM.

The most remarkable collection of wax-candles, and specimens to illustrate wax-bleshing, is that of RascLav and Sox, wax-bleschers (Chen IV., 24, p. 194°, who cabilit in the Soxth-Wort Gibbert, The mundratures exhibit in the Soxth-Wort Gibbert, The mundratures the caselle, and especially the very careful attention between the wick, the value of which was only to be accertained by herning. The night-lights have the control of the control

f. Ornamented Candles

The collection of orasmented wax-enadles for weldings and fee days is in fair proportion. France, Portroat, * Russta, and Westersmund furnish specimens. Some decorated wax-enadles for Catholic churches are also contributed by Toxica and Co. to the Mediaval Court (Class XXVI., 356, p. 762).

The only three objects till to be noticed are candles made in the control of a greenih colour, and prohably from the way of the Mgrica cerifera. The others, from New Bureswicz, G.S., p. 603, are dark green. Lastly, there are hake candles made from hituminous shale of the Binney Quarry, Scottand, exhibited in the North Gallery (4), p. 793).

g. Spermaceti.

Spermaced is a white extualline body, fusing at 40° C. (190° Y.) In its chemical relation is in cheety allied to wax, and, according to the experiments of Mr. Laurence and the control of
DESCRIPTION OF THE PROCESS OF SPERMACETI REFINING AT MISSES. OGLERT AND CO.'S WORKS, LAMBETH.

Bagging.—To separate the crystallized sperasceti, the sperm-oil is filtered through long cylinders of bagging,

* There is a manufactory of stearie candles in Lisbon, but it has not contributed any of its productions. lined with linen, these are at one end tied on to the rozzles of a feed-pinc communicating with a tank elevated thout 6 feet, whilst the other end of the epithedr is feed up with a string. The oil being pressed upon by its own column, readily passes through the bugs, which retain the spermaceti. This operation is called bagging, and is performed on a very large scale in the atturnm and

winter.

The spermaceti is of a dingy-brownish colour; and is readily removed from the bags, which are open at both ends; in this state it is called "bagged sperm,"

Pressing.—The bagged sperm is then placed in hempen sacks, and subjected to a pressure of about 80 tons in an hydraulic press, which removes the greater portion of the adhering oil.

autering of princips.—The pressed sperm is now melted, and crystallized by slow cooling, and after being ground then subjected to the action of a much larger by drault pross, engable of exerting a force of six hundred tons. The oil which runs from this press contains a small quantity of spermaceti, and is, therefore, returned to the logs to be filter.

Application. The spermacett is next melted in a large frost record, and boiled for some time with a solution of curactic soda, which readily asposities the sperms-oil still adhering to the spermacetic, whilst it has scarcely any action on the spermaceti itself. By this means the sperms-oil is removed in the form of soap.

Hot-pressing.—The purified spermaceti is removed from the boiler, and run into flat tin-monids to crystalline. It is then ground again to powder, and placed in linen bags, interleaved with horse-lair mats, and previously-bented iron plates, and pressed in a borizontal hydraulic hot-press, heated by steam.

"Scood Reference," The hot-pressed spermaceti is then removed and boiled with a strong alkaline lye, the temperature reaching 113 °C (255 °F). By this fluid operation it becomes as colonrless as water, and has only to be cast into blocks for the coversione of storing.

The wholesale price of spermaceti at present is 1s. 16d, per pound in Fagland. Spermaceti-candles are moulded in the usual manner, about 3 per cent. of wax being added to prevent eysnalization. Spermaget-candles are often coloned vellow

with gamboge, and are then known by the name of transparent wax.

The wick of the spermaceti-candle is of plaited bleached cotton, and requires no previous preparation.

UNITED KINGDOM.

There are remarkably fine specimens of spermaceti and spermaceti-candles in the English Department, contribated by Four Exhibitors.

There are also specimens from the UNITEN STATES and Naw SOUTH WALES, of a less important character. It will be seen, from the subjoined account of Imports into the United Kingdom, that very little spermaceti is brought in as such, and that the major part is obtained by refining sperm-oil.

There are Sixty-four Exhibitors of candles of all nations; of these there are:-

The Sixty-four Exhibitions of cualles admit of classification according to the description of coulter they chiefly exhibit, for only two lave contribated in more than one of the clases into which they may be subdivided. Thus, there are Sexus hillow-sendle-makers, Twenty-one waxcoundle-makers and wax-dustrebers, From spermaceit, could be made and wax-dustrebers, From spermaceit, startize and mad steative-canalle manufacturers. Nine of the latter exhibit way, but only as a secondary product of their startie manufacture; it has not, therefore, been taken into consideration under the lead of soop and pertakes into consideration under the lead of soop and per-

Before specifying the contributions of each Exhibitor who has received the award either of a Council Medal, Prize Medal, or Honourable Mention, a few words may be said to illustrate the point of view from which their merits have been judged. From our introductory re-marks respecting the different varieties of caudles, it is evident that tallow, stearie acid, composite, wax, and sper-usceti candles cannot be judged by the same standard, as the various products serve different purposes, and on account of the difference in their cost can scarcely be said to compete one with the other. The physicist may determine their relative illuminating power by experi-ment, and can, by comparing the price of similar quantities of different materials, ascertain the relative illuminating value of each variety. If carefully executed, such experiments may yield very positive results as to the purely economic question of the money cost of a given quantity of light, but are of no avail in estimating tho advantages offered by the different articles in point of eleanliness, purity, or presentability: how, for example, can the relative purity of stearic seid, wax, or spermaceti be estimated? how can the blue white of stearic acid, the brightness of wax, the transparency of spermaceti, be measured by such means; and bow the convenience of the self-soutling candle?

If photometric experiments on the different illuminating powers of flames are to be of any value, they must be instituted with extreme care and accuracy, Hitherto the results obtained by different physicists buve been marked by great discrepancies; this is to be explained by the difficulties which present themselves in the method of We need scarcely determination at present pursued. We need scarcely remark that we have not instituted experiments of this kind for the purpose of comparing the different varieties of candles exhibited. The amount of material submitted to the Jurors was so extensive, as to compel them to confine themselves to judging of the quality of the produc-tions by their external appearance and the manner in which they burned. On account of the great difference in the fiscal relations of the countries contributing, and the great variation in the price of the raw material, it was not even possible to take into consideration the question of price which was given in some instances.

question of price which was given in some instances,
A little practice, however, soon enabled the Jurors to
separate the different articles into the three classes of
Excellent, Good, and Mediocre. The characters by

which these were fixed were -colour, density, and fusingpoint of the caudies, brilliancy and steadiness of the flame, continuous consumption of the wick, and less or greater tendency to gutter in a current of air.

LOT OF AWARDS.

Apollo Stearin Company, Vicina (Austria, 39, p. 1009). Prize Medal, for an interesting display of stearic neid in blocks, and stearic enodles; this is one of the largest, while, at the same time, it is one of the best in the Exhibition. The great excellence of these candles manufactured by the process of lime-saponification, their hardness and whiteness, are evidences of a thorough knowledge of this chemico-mechanical art, and of a minute nttention to all the details of the various processes, without which no such articles could be produced.

Banckav and Son, Regent Street, Londoo (Class IV. 24, p. 196°). Prize Medal. A very large collection, illustrative of the processes of wax-blesching and waxcandle-making. Also wax night-lights, and wax mortarlights for warming dishes on the dinner-table,

The Medal is awarded to these Exhibitors, chiefly on account of the excellence of the above-named products; but as they exhibit likewise remarkably good stearie and spermaceti enadles, these latter are included in the

Award.

Bauwens, L. F., Grease-Works, Wakefield (Class IV., No. 26, p. 197*), Prize Medal. The Award to this Exhibitor is for the recovery of fatty acids, applicable to soap-making and to the manufacture of candles, from the waste lyes and suds of the woollen, silk, and cotton manufactories. The quantity of soap used by the various branches of manufactures in favour of which the soap-doty is remitted, amounted in the year 1850 to 22,858,382 lbs., which may be estimated as containing on the average about 30 per cent, of fats, or 11,429,191 lbs., or in round numbers 5,000 tons. The importance, therefore, of econo-mining this otherwise waste product will be fully appre-ciated if it be taken into consideration, that the manufacture of wool cutails moreover the employment of a large quantity of oil, which is afterwards removed by washing, The quantity of oil employed for this purpose in Great Britain may be estimated at about 6,000 tras, contained in the sads in addition to the fat contained in the soap, making together about 11,000 tons. But supposing that from unavoidable sources of waste only 5,000 tous were annually recoverable, and estimating it to produce 15f.

per ton, the value would still amount to 75,0000.

Bear, J. J. and Co., Madrid sud Gijon (Spaio, 245 and 246, µ. 134). Prize Medal. The Jury award to M. Bert In Prize Medal for products of the highest class from the two manufactories he bas established in Spain. From that of Madrid, in which sapooification by lime only is practised, he sends beautiful steario acid and stearic candles; from that of Gijon, in which he has lately creeted a distilling apparatus to include the most recent improvements of England and France, he sends palmitic acid equal to any in the Exhibitino, together with candles made of it. These latter candles are allowed by the Catholic clergy of Spain to be used in the churches

Brandon, N. D., Amsterdam (Holland, 70, p. 1145), rize Medal. The candles exhibited by Mr. Brandon are Prize Medal. a proof that io Holland the stearie maonfacture has reached its highest state of perfection; his candles are all that can be desired in hardness and careful moulding. The long stearie candles, which in Holland are allowed by the clergy to be used to charebes, are very beautiful specimens of manufacture. The interest in the collection of this exhibitor is enhanced by the intermediate products which be has sent to illustrate the various stages of the

BRIES, C., Dublin (90, p. 794). Hononrable Mention.

In the year 1830, 278,022 bales of foreign wool, each containing on the average 220 lbs, were imported into London, Javerpool, Hull, and Leith, so that about 31,000 tous were imported in that year; and as about 20 lbs. of oil are consumed in "working" or scrubbing every 112 lbs. of wool, there must have been upwards of \$5.00 tous used for wool, there must have been upwards of \$5.00 tous used for the foreign wool only,

Mr. Brien exhibits very well-manufactured tallow mouldcandles, which are white and hard. CAMPENHOUDT, CHARLES VAN, and Co., Heusden, Flan

ders (Belgium, 436, p. 1164). Prize Medal. The productious of these makers, whilst they are the finest in the Belgian division, may vie with most to the Exhi-bition for whiteness and hardness. Their candles oamed "Bongies de l'Etoile" are beautifully moolded, and have

a high degree of polish

DELACRETAZ and FOURCADE, Vangirard, near Paris (France, 13s, p. 117s). Honourable Mentiou, Messrs, Delacretaz and Co, are extensive contributors to the Exhibition, having sent some very large blocks of stearie acid, which is hard, but not of the highest degree of whiteness; the Jury, therefore, though they cannot award a Prize Medal to them, accord an Honourable Mention for their productions, which are very good, and which it appears they manufacture on a very extensive

senle. Dixon, George, Dublin (91, p. 795). Honourable Benion. The Jury make Honourable Mention of the clarified tallow mould-chadles of great whiteness, hard-ness, and exterior polish, made of a mixture of purified tallow and stearic acid; also of the composite candles and the yellow scap exhibited by Mr. Dixon, which is likewise well manufactured.

DONNEAUO and Co., Paris (France, 478, p. 1200), Honourable Mention. The Jury accord an Honourable Mention to Messrs. Donneaud and Co. for their stearie scid, and stearic caudles, called "Bougies du Phare though not possessing that whiteness though not possessing that whiteness for which the stearie acid of many exhibitors is remarkable, still their products are very ereditable, the candles being well moulded.

DEMONTER and Co., Lyons (France, 1593, p. 1253). Prize Medal, for most excellent white and bard stearie andles, well polished and carefully moulded.

FIELD, J. C. and J., Wignsore Street (Class IV., 130, p. 205*). Prize Medal, for the very fine blocks of white and hord stearic acids which they exhibit, and which evince a thorough knowledge of the stearic manu-FREEMAN, E., Wigmore Street (Class IV., 25, p. 197*).

Prize Medal, for very excellent spermaceti candles, called "transparent wax." The spermaceti candle (containing "transparent was. The sperimeces cannot communicate a small quantity of wax, to prevent crystallization) is in many cases preferred to wax, on account of its greater transparency, and brilliancy of flame. The peculiar tint of the wax is imitated in these candles by the addition of gamboge

HALE, W. S., Queeo Street (99, p. 796). Honoorable ection. The productions which Mr. Hale exhibits Hopograble Mention though very creditable, are not of the highest class, and seem more especially confined to the cheaper description seem more especially confined to the cheaper description of stearic candle, and those very economical, though not so presentable, sources of light, the so-called "Composite candles," which possess the property of being self-snaffing, and are much cheaper than the cheapest stearic candle, though, from their low fasiing point, they are oot so well adapted for use is hot climates.

Holnielab, L. P., Copenhageo (Denmark, 27, p. 1357). Honourable Mention, for a small collection of stearing eandles, exhibited io connection with other articles by M. Holmblad. They are white and hard, but extremely high io price.

night to price.

Jaillon, Moinier, and Co., La Villette, near Paris (France, 273, p. 1199). Prize Medal. The stearic seid mannificutred by these exhibitors is ambae according to a recently patented plan, which coosiate in passing a rapid current of sulphineous seld into the line-stat during the process of saponification, by which they state that they are able to produce a much greater quantity of solid fars than if they operated without the introduction of sul-phurous ocid; besides which, that they are enabled to use the commonest tallow, and produce white inodorous candles. The Jury could not enter into ao experimental investigation of the merits of this new plan, and, there-

^{*} The chemist cannot halp thinking of the conversion of the liquid oleic acid into the solid claids acid.

fore, wish it to be understood that the novelty or the supposed or real advantage of the process did not in the least influence the award of the Prize Medal, which is given solely on the merits of the products exhibited. The stearie acid and candles are, without doubt, amongst the best in the Exhibition, whilst they are the whitest in the French department made by the process of limesaponification.

Johansson, J., Stockholm (Sweden and Norway, 17, p. 1350). Prize Medal. The stearic acid contributed by this exhibitor is eminently pure, white, and hard, and is, with one single exception, the whitest in the Exhibition. It is most creditable to M. Johansson to have stood the test of comparison with so many veterats in the art, and to have come off with such high honours. The candles exhibited are most beautifully polished, more highly so thau any others, and in other respects well moulded; the polish is due to a peculiar mould, which is exhibited, and which is produced by a peculiar method already

described in the introductory notice (p. 624).

Masse, Tainoriller, and Co., Neuilly (France, 1346, p. 1240). Prize Medal. Messrs. Masse, Tribouillet, and Co. are amongst the largest exhibitors in this department, having contributed no less than thirty-five samples, illustrative of several very important branches of are connected with the manufacture of candles. Seven samples relate to that important industry in an economical point of view, the recovery of fats from waste suds and other refuse matter; as, for example, the parings of skin, and animal intestines. The candles manufactured from the distilled and pressed fats are very beautiful, hard, and white. There are seven also which show the progress of the manufacture of palmitic candles by the process of distillation, and include candles made with the unpressed fat acids, likewise very hard and white pressed palmitic acid candles, also candles made with a thin shell of hard polamitic soid, the centre being filled with the unpressed futty acids.* Three are the products of the recovery of fats from the waste sads of the wool-washers, and are similar to the first uamed. Four relate to the mannfacture of candles from regetable wax. There are also three specimens of the products of distillation from hituminous schist, including paraffin-caudles and candles govered with lithographic transfers, which it appears are used in France, but they have a very common appears Besides these, there are specimens of oleic acid, olein, from pressed tallow, and oleic acid-sods soap. The Jury award the Prize Medal to Messrs. Masse and Tribouillet for their very beautiful candles, manufactured from various fatty acids produced by the process of distillation, and their extensive and interesting collection of products

MATISEN, A., and Co., St. Petershurg (Rassia, 305, 1376). Prize Medal, for very beautiful stearic acid, of which MN. Matisen have sent seven blocks, and stearie candles, of excellent manufacture. These productions candles, of execlient manufacture. have a great degree of hardness, and are very carefully moulded

relating thereto.

moulded,
MILLER, T. J., Dorset Wharf, Westminster (Class IV.,
29, p. 197*). Prize Medal. An interesting collection
in the South-West Gallery, showing the progress of
spermaceti-refining: also an enormous and beautifully
crystallized hollow block, or grotto of spermaceti, in the - Western Nave. The Jury award the Prize Medal to this manufacturer on account of the very high degree of excellence to which he has brought the process of spermaceti-refining, as evinced by the absence of colour and impurity in the large mass he has exhibited; to produce which, no less a quantity than 3 tons, or 6,720 lbs., were fused at one time. After being allowed to remain at rest for n week, the spermaceti had cooled sufficiently round the circumference of the cask to be tapped, when about one half was ran out; so that the shell which is exhibited.

at 1s. 10d. per lh., is worth 30sl. MILLY, LOUIS ADOLPHE DE, Paris (France, 644, p. 1259).
Council Medal. M. de Milly exhibits stearie candles, called hy him "Bougies de l'Etoile," a name which, with that of Milly (stearin), is applied all over Europe to

* See page 626, China,

similar products. He has sent, likewise, lime-soop, the mixture of far acids resulting from the decomposition of this soap, pressed stearie neid, and oleie neid, so as to illustrate the various steps in the process; and besides these, oleie neid, potash or soft, and soda or hard soaps, made with the oleic acid. In consideration of M. de Milly being the first to solve the manufacturing problem of applying M. Chevreul's beautiful theoretical discoveries tu the production of candles, the application of boracic acid for the preparation of caudle-wicks, and the aid he has always rendered in establishing this chemical art in other countries, the Jury recommended M. de Milly to the Council of Chairmen as worthy of the Medal in their

MILLY STEARIN-CANDLE COMPANY, Victor (Austrin, 40, p. 1000). Prize Medal, for a very splendid display of the stearic acid manufacture, both by the process of distillation and the older one of lime-sapanification. This society have, in compliment to the Exhibition, sent three large and well-executed stearic acid Medallions; one of ange and well-executed secure field menions; one of the Emperor of Austria, one of Her Majesty Queen Vic-toria, and one of Prince Albert. Their candles, made by the process of lime-supunification, are very hard, white, and well moulded, and their night-lights, or evillenses, carefully manufactured. They have also exhibited the so-called "Composite" candles made with the unpressed products of the distillation of palm-oil.

MOTARD, A., Berlin (Prussin, 262, p. 1063.) Prize Medal. Very excellent stearic earniles manufactured by the process of lime-suponification, exhibited in connecti with the stearo-margaric acid of which they are made; with the stearce-margaric acts of which they are more, ulso, stearce candles made of the napressed and pressed fatty acids derived from palm-oil, by the process of disti-lation. The stearce candles from the hot-pressed fatty acids of palm-oil are very beantiful; those made with the acids, as they run from the still, are an excellent and cheap substitute for the tallow candle. The collection is well arranged, and illustrates both processes very satis-

OGLERY, CHARLES, and Co., Lambeth (139, p. 797). Prize Medal. The stearie candles contributed by this firm are the whitest in the Exhibition, and were used by the Jury as a standard of excellence, with which the production of other exhibitors were compared. The so-called "Transparent wax" capdles, made with a mixture of stearic[noid and wax, are very beautiful, and harn with a remarkably dry cup. The spermeeti, in block, also ex-hibited, is of the greatest whiteness, and most beautifully The spermaceti-capdles, and those made of erystallized. a mixture of spermaceti and wax, are exceedingly well manufactured. The Prize Medal is awarded by the Jury for the spermaceti and stenric manufactures, either us which would have entitled these exhibitors to the award. PITANSIER, Odessa (Russia, 307, p. 1376). Prize Medal, The piece of hot-pressed stearic acid exhibited by M. Pitansier is prepared from mutton-tallow. It is extremely hard and sonorous, and beautifully white; the stearie

candles are the whitest and best in the Russian Section. and occupy a first rank in the Exhibition, Poissar Uncle) and Co. (France, 1399, p. 1243). Ho-nournale Mention. The Jary make Honournale Mention of a few small pieces of stearic acid, exhibited with other articles by MM. Poissat and Co.; and which, from their diminutive size, had almost escaped observation. stearic acid was very white and hard.

Parce's Parkny Canner Company, Belmont Works, Vauxhall (Class IV., 83, p. 2012). Prize Medal, for the invention of improved methods of distilling fatty bodies, illustrated by the following articles: very beautiful white and hard candles manufactured from the distilled and pressed stearie acid of palm-oil; candles equally hard and white, made from distilled animal fatty acids recovered from the refuse of the glue-maker, and which possess an additional interest in being obtained from a waste product; and candles made from the distilled vegetable tallow obtained from the Stillingia sebifera. Besides these, they exhibit the unpressed distilled futty seids of palm-oil, in the state in which they are largely employed for the manufacture of the so-called composite candles, which appear to be destined to supersede the ordinary

tallow candle. (See the Prefatory Notice respecting the recommendation for the award of the Council Medal.)
QUANONS, C. and J. Careghen, Brabant (Belgium, 431, p. 1335). Prize Medal. The manufactory of these exhibitors, which was the first established in Belginm, is one of the oth-hoots of that of De Milly, in hence they adopt the name for their candles which was given to steare candles by their instructor, namely, "Hongies de l' Etoile," As regards colour and hardness, their stearic acid leaves nothing to desire; but their candles are not quite so carefully moulded as they might be, and have not that high degree of polish which is expected in candles of first-class manufacture in other respects Rosst and Scutarraneta, Turiu (Sardinis, 6, p. 1302).

Honourable Mention. Though the Jury did not find the stearic manufactures of these exhibitors quite equal to the best examples, they consider the stearie acid and catelles to be carefully made, and therefore accord them an Honourable Mention.

SAINTE and Co., Consypere (India, p. 922). Honour-able Meution. The Jury have much satisfaction in unking an Honourable Mention of the very good stearie candles manufactured in India by Mesers, Sainte and Co. local manufacture of stearie candles deserves every encouragement, as they are peculiarly saimble to hot cli-mates, on account of their high fusing-point, and as there must be a large quantity of fats of little value, which would answer well for their production, SAFELKIN, V., Moscow (Russia, 309, p. 1376).

nourable Mention. The Jury accord to M. Sapelkin an Honourable Mention, in consideration of the great care bestowed on the manufacture of wax-enodies for churchservice; many of these are tastefully ornamented with a simple spiral of gold, and have a very elegant appearance. The equality in size of the undles, as compared with one another, and likewise of their diameter throughout their whole length, are points deserving commendation. It appears that in the Greek Catholic Churches only wax or vegetable oil is allowed to be burned.

III, PROTEAN STONE, OR ARTIFICIAL IVORY.

Under this title there are exhibited, in Class XXIX., a number of articles, such as door-handles, finger-plates, inkstands, and letter-weights. These very beautiful objects are composed of a new material, derived from gypsum (native bi-hydrated sulphate of lime), which, by numerous variations in the method of treating it, is made to resemble ivory, granite, and various kinds of marble. From the specimens exhibited it appears to be very hard, and capable of taking the highest polish, which, it is said, is perpetuated by uso. It is translucent and brilliant in colour, and, being tinted throughout the mass, the ma bling and mottling are not liable to be rubbed off. It appears to be applicable to many purposes for which ivory and marble are at present used; but it is not fitted to be made into kuife-handles, on account of its brittleness.

In order to illustrate this very ingenious manufacture, we must recal to the recollection of the reader the very familiar phenomenon of the solidification of a mixture of plaster of Paris (de-hydrated sulphate of lime) and water, which arises from the circumstance that the graydrous sulphate of lime recombines with water equivalent in quantity to that of which gypsum is deprived by heat in the formation of plaster: hat, as mader the conditions of this solidification the plaster is diluted with far more water than it can recombine with, it results that a portion must be left in a free state in the interstices of the mass, which is consequently opaque, and, on drying, becomes porous; and although it is the same in chemical composition, it differs greatly in its physical aspect and properties from the native compound gypsum or alabaster, which is

erystalline and translucent In reflecting on the cause of this difference, It occurred

to Mr. Cheverton that if the combination of water and anhydrous sulphate of lime could be slowly effected, whilst the latter was in a state of compression, an artificial stone might be produced, compact and crystalline in texture, and translacent in appearance. This view was

The process by which these results are obtained is described in the specification of Mr. Cheverton's patent, obtained in June 1850, as consisting in the de-hydration and subsequent re-hydration of native bi-hydrated sulphate of lime, either in a compact form, as alabaster, or in the state of a fine powder. In the first instance the alabaster is wrought into the required form; and in the second, the material, in the state of a very fine powder, is compressed into a mould of the proper shape

In either case, after the object has been fashioned, it is exposed for 48 hours to a temperature of from 121' to 177 C. (250' to 350' F.), by which means the water originally combined with the sulphate of lime is driven The substance thus becomes very friable, but still retains the form into which it has been wrought. Sometimes placter-of-Paris itself is compressed into monlds, but the article so formed is still subjected to the operation just described, notwithstanding the previous baking of

the gypsum.

If a translacent appearance is required to be given to the surface of the figure, it is, before re-hydratioo, immersed into "white hard varnish," olive-oil, or other "oleaginous matter," until the surface is saturated; but if an opaque surface is desired, then this operation is

To effect the hardening, the object is plunged for an instant only into water hented to a temperature of from 38 to 651 C. (100 to 150 F.). This operation is repeated at intervals of from 10 to 15 minutes, until the sulphate of lime is completely saturated. The mass then becomes erystalline and much harder than alabaster; a circumstance which induces a belief that the new sub-stance contains a quantity of water in combination different from that in the native body; or, in other words, that it is a new hydrate of sulphate of time. The successof this part of the process depends in a great measure on the very gradual manner in which the combination with water is managed; for without due care the material deerepitates, and the article is then destroyed. The colouring is effected by dissolving the requisite

colours in water, and either sprinkling the object here and there with the coloured solution, so as to produce a mottled appearance, or else by immersing it altogether in the dye, which produces an uniform stain. This operation is performed previous to that of dipping in oil or

To the only exhibitors of this branch of manufacture D. STAIGHT and Sons (252, p. 802), a Prize Medal is

IV. BLACKING.

Although the compound which we now call blacking Freuch, Cirage) is, in all probability, of very recent invention, nevertheless it appears to have been customary to imbae shoes with an oily mixture before the time of Pliny, since it is stated by him that Cato recommended the dregs of the olive (after the expression of the oil) to be used fur anointing bridle-reins, leather-thongs, and shoes, in order to reader them supple." It must, howsomewhat similar to ever, be remarked, that a mixture modern blacking is also described by the same author, and it appears quite natural to infer the occasional use of it for renovating the black colour which we are also io formed was given by shoemakers to leather, by means of vitriol: two kinds of substances of this name being known, namely, blue-vitriol (sulphate of copper) and

green-vitriol (copperas, or sulphate of iron).

The mixture alluded to was chiefly used for ink, whence it was commonly called atramentum. It was composed of was commonay canrel atramentum. It was composed of hamp-black, gun, and vinegar, and would, therefore, only have required the addition of oil and boney to make it into a tolerable blacking. This inference is rendered the more probable from the discovery of the remains of leather found in the Roman gravel-pit discovered in digging the foundation for the New Royal Exchange, which appears to have been covered with a sort of black-

Not. Hist., Book xv. chap. viil.
 † Ibid., Book xxxv., chap. i.
 † Ibid., Book xxxiv., chap. xil.

ing. They are thus described by Mr. Tite, the architect.*
"The fragments, in general, are of black leather, similar to that of the other articles; but there are some pieces which may possibly have been ouec of another colour. It is most probable that the upper surface was almost always abluing, and several instances may be noticed where it still retains a dull gloss, which appears usually

to have protected that particular side."

The French word "Cirage," however, renders it extremely probable that modern blacking was originally composed chiefly of wax and tallow, and probably lampblack; and somewhat similar, therefore, to harness-black-ing. That ordinary liquid-blacking was first imported into France from Eugland, is probable, from the circumstance that blacking was termed Cirage Anglass, at all events to the year 1830, and it may still be known by that name.

When or how the English mixture now employed was When or how the Enginea mixture now supproject was first discovered, the Reporters cannot pretent to decide; hut, according to the statement of Mr. William C. Day (nephew of Mr. Charles Day), the recipe for its prepara-tion was communicated to Mr. Richard Martin whilst let was travelling on the Continent. Mr. Martin afterwards became associated with the late Mr. Charles Day; and in 1801 they commenced the manufacture of blacking. Mr. Martin having retired in 1808, the Insiness was still carried on under the names of Day and Martin, by Mr. Day, until his death, in 1836, by which period he had acquired a colossal fortune.

To give some idea of the extent of the operations still carried ou at "Day and Martin's," it may be stated, that on the average 150 casks, containing a quantity of blacking equal to 900 dozen piut bottles, are sent out per day. The price of the stoneware bottles, for containing the blacking. varies with their size, the usual sizes costing 6s. 9d. and 12s. per gross; and the corks (bungs) costing 1s. 4d. per gross. There is also a large outlay required for labels and scaling-wax.

Besides the establishment of Mesers. Day and Martin. there are, in Loudon, two other very important blackingmanufactories. One of these was founded by Mr. Robert Warren, who commenced about the same time as the firm already noticed, and retired some years back; but the business is still carried on by his successors; and the other was founded, at a subsequent period, by Mr. Everett, who commenced business in King's Head Court, Holborn, and afterwords transferred his mannfactory to Fetter Lane, where it still exists; Mr. Everett died in 1840, not, however, before he ind realised a considerable fortune. the last-named of these large blacking-works contributes to the Exhibition, and unfortunately its manufactures were not brought under the notice of the Jury,

Blacking, it may be remarked, consists essentially of two principal components, namely, a black colouring-matter and certain substances which will acquire a gloss by friction. Each maker has, of course, proportions and methods of mixing peculiar to himself, but the chief materials used are the same in most cases. In England? they generally consist of : - Bone-black, sugar or molasses, they generally consist of :— Bone-black, sugar or molasses, sperm-oil, sulphuric seid (oil of vitriol), and strong vinegar. These, according to Mr. W. C. Day, are mixed in the following order: :—The bone-black, in the state of a very fine powder, and the sperm-oil are first thoroughly incorporated; the sagar or molasses, mixed with a small control of the strong with the same of the strong with the same of the strong with the same of t proportion of vinegar, is now added and well stirred with the mass; strong sulphurie acid (oil of vitriol) is then gradually poured into the vessel. Much heat is generated at this stage of the process, and an effervescence ensues, owing to the action of the acid on the carbonate of lime

 Antiquities of the Regal Exchange, 1848, p. 56.
 According to the Information which Baron Lighig has kindly fernished to the Reporters, it appears that, in many, blacking is made in the following manner: powdered bone-black is mixed with half its weight of molasses, and one-eighth of its weight of olive-oil; to which are after-wards added one-eighth of its weight of hydrochloric acid (muriatic acid), and one-fourth of its weight of strong sul-phoric acid. The whole is then mixed up with water to sort of unctuous paste.

contained in the bone-black. The object of the sulphuric acid (which should not be in excess) is to cause the sens (which should not be in excess) is to cause the decomposition of the tri-basic phosphate (and the car-bonate) of lime, contained in the bone-black, so as to produce on the our hand sulphate of lime, and on the other a soluble seld phosphate. Sulphate of lime, when produced under such circumstances, gives rise to a very tenacious paste, by mixing with the finely divided car-bonneous matter of bone-black disintegrated by the same reaction; which paste (or lake) is capable, when sprend out, of assuming a very smooth surface. To this the reaction; which proceed states to expand out, of assuming a very smooth surface. To this the sugar and the oil impart the property, us touly of adhering to the leather, but also of taking a high degree of lustre ander the frictional (or barnishing) action of the brish; the oil is moreover very useful in rendering the leather

The mixture, after the action of the acid has ceased, is diluted with an additional quantity of vinegar, and is bottled whilst it is still warm. By bottling the liquid in this state, and corking and scaling it immediately, a rare-fled space is formed; and there is no liability afterwards that the blacking (if it wet the cork) will exude by the expansion of the air contained in the bottle, as it is not likely to become again heated to the same temperature

intery to become again measure to the same temperature mother the influence of any climate to which it may be subjected. The vinegar employed should not be too weak, otherwise the hlacking will not keep. Paste-blacking is now made in precisely the same way as Liquid-blacking, excepting that the last portion of vinegar is not added. The employment of such blacking appears to have preceded that of fejuid-blacking. It was usually stock on to a small shovel-shaped board, having a very short handle; and it was wetted with water (or saliva) as required. The old Cake-blacking differed in composition from that of the present day, and appears to have contained lamp-black, trencle, and oil,

AMERICA Two exhibitors send both Liquid and Paste-blacking,

the former being contained in glass bottles and not sto the former being commined in graces bottless and not seon-ware as in England. The blacking was found to be nearly of the same quality from both; hat not so good as that commonly used in England. The contributors are— E. Sternik (290, p. 1453), W. B. Bakzin (401, p. 1462), T. FRANCE

In 1847 there were, in Paris, One hundred and thirtyseven manufacturers of blacking and varnish for shoes, who employed 140 workpeople, and produced goods to the value of 38,800 f.; France is, however, represented by only one exhibitor in this trade, M. Hérsen (869, p. 1221), who sends a specimen of varnish for boots and shoes, which was not submitted to the Jury of Class XXIX.

Pattesta

The only contribution is from C. TEICHMANN (p. 1088); it consists of Paste-blacking, which, though of fair quality, is not equal to the English blacking. SARDINIA

B. Bouroots (75, p. 1305) exhibits specimens of Pasteblacking for shoes, and paste Harness-blacking, which call for no particular comment,

UNITED KINGDOM.

The contributions of Two Exhibitors only were brought The contributions of Two Exhibitors only were brought under the notice of the Jury of Class XXIX., namely, 272 and 281 [p. 815]: of these the best is that of S. B. Alcock and Co., of Dublin (272, p. 816), whose productions are here favourably noticed, although no Award was made. The wholesale prices of their usual size bottles of liquid-blacking are 3s, 6d, and 9s, per dozen,

The manufactures of the other exhibitors who contribute to Classes:—11., 22, p. 190; IV., 70, p. 200°; XVI., 39 and 322, pp. 519, 534; were not observed by the Reporters

until the duties of the Jury were completed. The number of Exhibitors from all parts is Thirteen. There were no Awards. The classification according to the various countries is

V. CHEMICAL MATCHES.

The manufacturers of chemical matches are placed in un anonaslous position with regard to the other contri-butors in the Great Exhibition, inasmuch as that they were not permitted to send their actual produce, on account of the precantions deemed advisable to be taken for the security of the Exhibition Building against fire. Hence they were compelled to rest satisfied with contributing nuinflammable imitations of their articles; and ander such circumstances it is evident that it was quite impossible for the Jury to make any equitable Awards in this branch of industry. This result is the more to be regretted as the manufacture of chemical matches, although comparatively a very recent art, has been of late years developed in a most remarkable manner; and notwithstanding the high degree of perfection to which it has already attained, it is still undergoing further improvements consequent on the ranid progress of chemical science. Had it been possible to have foreseen and provided against all contingencies, an out-building might have been constructed for the an out-toroung might have reconstituted for the reception of these goods, which would have afforded a secure as well as a most valuable opportunity of comparing the relative merits of the matches prepared in various

In another part of this Report will be found some descriptive notices of several conveniences for travellers and others contained in the hollow heads of walkingsticks. One of these consisted of an apparatus for procuring instantaneous light, and the contrivance appears almost to realize the fable of Prometheus, who concealed the fire which he stole from Jupiter in his norther, ferula, or stem of fennel, on which he leaned in travelling.

44 I am he who sought the source of fire, Enclosing it hid in my narthex-staff; And it hath shown itself a friend to man, And teacher of all Arts." This invention, however, was in reality only the means

of preserving fire unextinguished, somewhat like the German tinder of the present time, and not of causing instantaneous ignition. The giant fennel, of which the ordinary ancient walking-sticks were made, sheds its seeds about September, when the stem decays, and becomes a substance so easily ignited as to be employed in Sicily for tinder. The pith of the plant also is stated by Proclus to be an excellent preserver of flame, to which Pliny adds his testimony, that it makes excellent matches, the Exprtian sort being the best. t

There is, however, another form in which a staff may be metaphorically said to conceal fire, since one of the most primitive means of producing it was by the friction of two pieces of wood against each other until sparks were emitted, and flame was then easily communicated to dry leaves or decayed vegetable matter. This method of procuring fire has been found generally in use in several savage nations, though with some difference in the process; and St. Pierre describes one of the most common, as practised by the West Indian negroes:-"With the sharp edge of a stone," says his narrative, " Paul made a small

hole in the branch of a tree that was sufficiently dry, which he fixed firmly between his feet, and he then employed the stone to shape into a point another piece of wood, equally dry, but of a kind different from the former. He next placed the pointed wood in the hole which he had provided, and made it to turn rapidly between his hands like a chocolate-mill, and in a few moments he saw smoke and sparks issuing from the place of contact, and then collecting dry plants and sticks, he lighted a fire at the foot of the palm tree." It appears that the same process was in ordinary use

with the Romans down to a late period, even when the flint and steel were well known. "This experience, says Pliny, "was first discovered in camps and by shepherds, when a fire was wanted and a fitting stone was not at hand; for they rubbed together wood upon wood, hy which attrition sparks were engendered, and theu collecting any dry matter of leaves or fungi, they casily took fire. For this purpose nothing is better than to ruh the wood of the lvy with that of the laurel, and a wild vine, different from the labrusca, which grows upon trees in the manner of ivy, has been also proved to be good."† The wood fit for kindling a light, denominates them igniuria, or those trees out of which fire may be produced. Pwridicula Igniaria appears to have been the usual name of a Roman tinder-box, but Solinus calls the fire-box Ionitabulum, and assigns its invention to Pyropolis, in the island of Delos.2 In those receptacles the apparatus probably consisted as well of a small iron bar and a fragment of flint consisted as well of a second state of the control bestowed on man at the commencement of the reign of Jupiter; and pyrites are described by Pliny as being well known and esteemed for producing sparks. "Certain of them," he says, "have much fire in them, whence we call them living, and they are very heavy. They are sought for because they are most valuable in camps; for when they are struck hard with an irou spike (clauss), or another stone, they will emit sparks, which being taken by sulphur or dry fungus or leaves, will cause them to catch fire even with the rapidity of speech."

There does not appear to be any information extant relating to the material anciently employed for tinder, unless it may be presumed to be indicated in that passage of the Prophet Isaiah (chap, i., v. 3t) which declares that " the strong shall be as tow und the maker of it a spark, and they shall both burn together, and none shall quench them." It is probable that a very small degree of experience would suggest the thought that flax or the linen wicks used for lamps would easily receive sparks and become ignited, but of this there has not been any certain

information preserved.

For many centuries the apparatus of a stone struck against a piece of iran continued, with but little improvement, to be the only means of procuring light. By the Saxons the flint or the pyrites was used under the general name of fyr-stan; and any piece of iron that was suffi-ciently substantial was the substitute for the modern A writing-stylus is known to have been used for the purpose by the Abbot Bertin in Burgundy, early in the seventh century; an instrument, however, which should be at once more substantial and more convenient aboutd he at once more intosantia may more convenient for striking, must have been soon required, and was pro-bably as speedily invented in the form of the feath, a thick rhounboilds piece of steel, having the faces cut into many angles. This was in use at a very carry period of the Middle Ages, when it is frequently to be found mentioned under a variety of names, all of them being mentioned under a variety of mannes, an of them being derived from the same original. In 1429 Philip the Good, Duke of Bargundy, established the Order of the Godden Fleece, in the collar of which the fiint and steel of the time formed the principal device. The latter was

† Detonating mixtures of chlorate of potasb with either sulphide of antimony or phosphorus, are described in Parke's Ciemical Caterhian, 10th Edit, published to 1822; and the latter in the 3rd Edition (1808).

(to whom the Reporters take this apportunity of expressing their thanks for most of the satisficial and other information respecting the progress of the art in Germany, there are in the province of Narkenlarg, Grand Duchy of Hesse Darmstath, no less than cight manufactories, producing weekly about Synovino boxe of manufactories, producing weekly about Synovino boxe of manufactories, producing weekly about Synovino boxe of manufactories, producing the state of the state of the state of which, are valided at South Indian (2012), by the Germal the production of utrificial) chemical matches,

In Austria, the manufacture of chemical matches has been of late developed to so great an extent, that it supplies not only what is required for home consumption, but also enough to form an important arricle of exportation; indeed it uppears that the most important item of Austrian commerce with Chili consists of matches.

The matches manufactured in Austria amounted in 1849 to 50,000 cut., of which four-fifths were consumed in the country, not one-fifth was exported. From Trieste 3,787 cut. were shipped, viz., to

That the export trade of Austria in matches is rapidly increasing, appears from the following statement of the quantities shipped on the Eibe during the last three years:—

As matches are not always specified in the Official Report on Commerce, it is not possible to give a detailed statement of all the quantities exported,

It is estimated that of the total production of matches in astrain, one-third in manufactured in likelensia, and twothirds in the factories of Vienna and its vicinity. The number of factories in Boltenia is ten; of these there are not assume that the sum of the state Teplitz, one at Tusu, one at Techemoschin, one at Schinthal, one at Nation-time, and one at Hebrenber. These exhabilishment give employment to about 1,000 work-

In Austria Proper there are twenty-two factories, manely, sixteen at Vienna, two of which exhibit, three at Funfauss, one at Schärding, one at Thile, and one at an exhibit, three Pottenstrie; there is also one in Moravia, which likewise exhibits. The number of workpeople employed is about 2,000.

In illustration of the quantities of the different numerials employed, it may be stated that a Bohemian manufactory employing 100 workpeople produces annually about 200,000 boxes, each containing 2,000 matches. It consumes annually 22 ext. of nitre, 64 ext. of phosphorns and 300 ext. of subplar. Calculating on these data the total amount of materials consumed in all Austria, the following numbers are obtained.

The quantity of soft wood consumed ansembly amount to 5,000 Melffers or fathoms; and it is worthy of notice that a large portion of it is manufactured into splints in Budweis, and thence sent to Vienna. About 5,000 millions of single matches are produced annually in Austrian. These are made with automiting papility, in consequent Pose are made with automiting papility, and present and the supplies of the production of the

From other parts of Germany there are Four Exhibitions, nancely, one from Prusia, two from Warriemburg, and one from Mecklenburg-schwerin; the Reporters, however, lawe no been able to accentain how far they represent the manufacture in all those places; but they are caushed to state that there were twenty-one manufactories, employing five hundred and sixty-one workpeople, in Prussa in 1146.

According to a statement of N. Pyren, the quantity of phosphorus common in France for inferiorizations of phosphorus common in France for inferiorizations of the phosphorus common in the phosphorus of the phosp

into the United Kingdom, as chemical matches are entered in the Costum returns under the general head of "Goods non-enumerated."
Formerly large quantities of phosphoras were imported into the United Kingdom for the purpose of chemical-match making; but it will be seen by the following miles, that this substance must now be made within the Piritish domainon in sufficient quantity to sneply the

7 revious to the 2th of July 1842, the imports of phosphorus were cotered under the general head of "Goods non-caumerMed."

The match having reached this point of perfection, some attention was given to the embellishment of the boxes by the various manufacturers, who tried to excel cash other in the clegance, convenience, and security of the case, for which various materials were employed—for instance, card-board, wood, and metal—the latter being usually ornamented with coloured lacquere, and engine

turning.

With regard to the composition for the matches aow
in use, Dr. Ure, in the Supplement to his Dictionary of
Arts and Manufactures, p. 153, gives the following recipe
of Dr. R. Boettger:

The giue is to be converted into a rmooth jelly with a little water, and put into a warm moriar to liquefy; the phosphorus is then to be rabbed down with the gelatine, at a temperature of from 60° to 63½. C. (40° to 130° F.), after which the nitre is to be added, then the red powder, and, lastly, the smalt, the whole being earchilly mixed until it becomes an uniform

Lucifer wood-matches that inflame without sulphar are prepared, according to Dr. Live, by the ends being rubbed against a red-hot iron plate, and then dipped for a moment into melted white wax, contained in a shallow

flat-hottomed pan.

In Morch 1842, Mr. Reulen Partridge obtained a patent for forming wooden splints by prossing, with assimble mediurer, a flower for was against a steel plate perforated with holes, placed, together as closely as possible. The wood is thus forced horough the perforation with the production of the place of the plate of plate of plate of the plate of the plate of p

Erlangen, 1847, The disease has been observed principally in Germany, but it is also met with elsewhere, and especially in England." The Reporters had the opportunity of obtaining some information on the subject from Dr. Sieveking, who has examined the disease with much care as it occurs in the London manufactories. According to his observations, the affection assumes the same character as it has done in Germany, and attacks those only who are engaged in dipping the untches into the inflammable compound, and who are, therefore, more immediately exposed to the phosphorus vapour. Dr. Sieveking saw several of these workmen (dippers) who had lost almost the entire lower jaw. After these painful statements, it is important and consolntory to know that the same physician has not found the disease to be equally prevalent in all manufac-tories; and that if cleanliness be enforced, and the dictary of the workpeople well atteaded to, and especially if a complete and continuous ventilation of the workshop be kept up, no evil consequences ensue. Dr. Sieveking met with parties who had been engaged in dipping matches

for more than ten years, without exhibiting the slightest

tendency to the complaint.

The importance of attending to the precantions indicated by these investigations can scoreely be sufficiently impressed upon the ununfacturer. Much has been already done by several firms, especially in regard to ventilation, but much remains to be accomplished if this frightful scourge is to be entirely removed. For this reason manufacturers should direct their attention to an important discovery made by science, in the shape of the su-called red or unorphous phosphorus. Some few years ago Professor Schrötter, of Vienna, observed the curious fact, that if ordinary phosphorus he exposed during a certain period to a temperature of from 250 to 260 (482 to 500 F.), it is converted into a red modification which no longer possesses the main characteristics of phosphorus, viz.,-volatility, fusibility, and inflatama-hility at comparatively low temperatures. The posonous qualities have also entirely disappeared in this modified condition of the substance. The nuorphous modification of phosphorus, which but a few years ago was a mere curiosity in chemical laboratories, can now, however, be manufactured, according to a method proposed by Schrötter, in large quantities, and is likely to become an important article of commerce. The Chemical section of the Exhibition (Class II., 119, p. 199) contained a fine specimea of this substance, sent in by J. E. STUBLE, of Birmingham. The red phosphorus being perfectly innocuous when handled, and not giving off finnes in the atmosphere, whilst it is as well adapted to the manufacture of matches as the ordinary phosphorus, it is fair to assume that its general adoption by ineifermatch makers will prove a further guarantee against the disease of the workpeople. It is right also to mention that Dixon, Son, and Co. have exhibited matches made with Schrötter's phosphorus (Class 11., 126, p. 190). These manufacturers state that they are as cheaply and as easily made as the common matches, and are not so liable to fire in the making.

The number of exhibitors of imitation matches and other means of obtaining light is fourteen. The classification according to the several countries is as follows:—

LIST OF EXHIBITORS.

Bell and Black, Bow Lone (Class XXIX., 243, p. 802). Imitation vestas, congreves, and wax-matches; camphorated round wood congreves. Dr. Majo, S., Triesch (Austria, 50, p. 1009). Imita-

VI. CONFECTIONARY,

The articles belonging to this species of preparations submitted to the Jury of Class XXIX, consisted firstly, of fruits preserved with sugar; and secondly, of confections, comprising sweetmean made both from sugar and from chocolate. Of preserved fruits, the Exhibition contained many examples: including some which had been prepared with sugar and subsequently dried, and others preserved and kept in syrup.

In the most ancient times, honey constituted the principal and nearly the only sweet substance used for those purposes for which sugar is now almost universally employed; and the Egyptian department in the Exhibition furnishes evidence that its use for the preservation of fruit is still continued in the valley of the Nile. Many interesting specimens of the most simple forms of conserves are also contained in the Turkish and Tunisian collections, consisting of the desiceated pulp of prunes or juice of the grape. It is possible that the former pre-paration may somewhat resemble the "cakes of figs" of the ancient Hebrews, which, from the two passages of Scripture wherein they are mentioned (1 Samuel, xxv 18, xxx. 12), were evidently regarded as agreeable and nutritions food. That the Jews had some kind of artificial sweet preparation at a very early period of their history, is indicated by the statement that the taste of the mauna "was like wafers made with honey" (Exodes, xvi. 31), though the parallel passage in Numbers, xi. 8, expresses it to have been like "freshoil." The word Confection, and the term Confectionaries, as they occur on the Scriptures, have two distinct significations in con-nection with this particular subject. In the first instance, the strict original sense of the expression as derived from cou and facere, to make up together, is intended; as in the words " thou shalt make it a perfume, a confection and holy," Ecodes, xxx. 35. When, however, Samuel says to the elders of Israel concerning their king, that he would take their " danghters to be confectionaries, and to be cooks and to be bakers" (1 Samuel, viii, 13), there is a special and a distinct employment of the makers of some kind of conserves or sweet preparations referred to, of which no decided information is extant. From two wellknown remarkable passages in the Prophets, there can be little doubt that the Hebrews were acquainted with the existence of the sugar-cane, probably as it was found in China.* They both prove, however, that it was a very costly rarity; and the three words which in the Scriptures denote sweet substances, are all rendered honey in the Authorized Translation, though possibly they indicated several kinds of it. The passages which are supposed to refer to sugar are very different from these. "Thou hast bought me no sweet-case with money," says the remon-strance in Issiah, xliii. 24; and "To what purpose cometh there to me incense from Sheba, and the sweet-case from a far country?" is the complaint in Jerminh. vi. 20. In both these places the allusion is to an offering vi. 20. In both these places the allusion is to an offering to the Almighty, which, precented in a right spirit, would not have been rejected. This, therefore, could not have been loney, because in Zentificss, ii. 11, the positive command is given, "v shall burn no leaven, nor any boney, in any offering of the Lord made by fire." The substance referred to must therefore have been either the sugarcane, or the aromatic sweet-rush. The word rendered Calamus in Erodus xxx. 23, in the direction for making

the anointing-oil for the furniture of the tabernacle, is also Kench Bosen, or sweet-cane, in the original; but this is generally supposed to mean the Indian Calamus Aro-

Although the cane-sugar of Asia must have been well known to the classical ancients, yet they seem to have recarded it as a kind of factitious honey. In this form Herodotus* appears to refer to it, when he says that the Gyzantes have bees "which make a great quantity of ney, and it is said that confectioners make much more, The original words of the historian in this place have the general signification of compounders, or workers, for the people.† From the context, however, it is evident that the terms are to be understood as implying preparers of confections, as they are also in another passage of the same author, wherein it is stated that the confectioners of the city of Calletabus "make honey with tamarisk and wheat." It may be observed farther, that the same word is likewise used in the title of the fragment of an epigram attributed to Menander relating to the making of a bride-cake. It consists of a short conversation, in which the operator represents that he has watched the preparation all night, but that there is yet much to be done. Such a person as this, who understood the art of confectiouary as retained by the wealthy Romans, was called Pistor Dulciarius, or a baker of sweet things; and several of the brouse moulds which the pastrycooks of the time employed for the making of their sweetments, representing hearts, striated shells, animals, and a variety of elegant devices, have been discovered at Herenlaneum. About the same period, also, Apicias, Columella, and Pliny prove that some fruits at least were preserved in The last author recommends that quinces should syrup. The last author recomments that quinces should be belied in honey, and directs that other sorts should be enclosed in wax. The latter process Beckmann states enclosed in wax. to have been likewise employed for preserving the apples carried every year from the southern districts of Russia into the northern parts of Siberia. But though the value of augur as a Inxury was not

unknown to the ancients, it was, from its first introduc-tion to a comparatively late period, more commonly conployed by physicians for the disguising of disagreeable medicines, and in the pharmaceutical preparation of syrups, electuaries, and confections. This practice ap-pears to have led to the intimate connection which so long existed between the preparation of conserves and the compounding of drugs. Actuarius, who is considered to have flourished between the twelfth and fourteenth centuries, is said to have been the first physician who substituted sngar for honey in medicinal compositions; about which time niso it was frequently used in cooking in England. Dioscorides, in the first century, is the earliest aothor by whom it is mentioned by name, and he also notices its medicinal properties.

The nrt of making sweet compositions being thus early associated with the occupation of the apothecary, and his productions being known under the general title of con-fections, the same name appears, for a time at least, to have been used for the preparers both of sweetments and of medicine. In the thirteenth and fourteenth centuries there were certain officers, called apothecaries, retained by princes and great personages, who prepared various preserves for the table, especially fruit encrusted with sugar; but it is quite possible that these individuals were sometimes ecclesiastics, who also possessed the knowledge of medicine and pharmacy. Beckmann has recorded many curious notices illustrative of the connection existing between the professions of the apothecary and the confectioner, as they were publicly established in Germany from the middle of the fifteenth century. From these statements it is evident that the term ap-thecarius was then understood to signify the keeper of a storehouse or magazine for articles belonging to the Materia-medica.

^{*} The earliest records of China make mention of the eniture of the sugar-cane and the extraction of the sugar ; the application of which as food appears to have been known in the most remote ages of Chinese history.

Melpomene, exciv., cited in Pereira's Elements of the Materia Medica, 2nd cells, ii., p. 8th. Herodosus, a mer translation, by the Rev. II. (Tury, 1948.

 The Forms of Cury celted by the Rev. S. Pegge, p.

confections and cooling liquors prepared for the sick, These establishments were becased by authority, and the persons who kept them endued with exclusive rights and municipal privileges; in return for which they were sometimes required to supply the court or the towncouncil with confectiouary or sugar, as well as to vend

their medicines at appointed rates, It is probable that in such a stipulation of furnishing confectious and sugar to public authorities, ariginated the practice which became common in England in the sixteenth century, of presenting rich boxes of sweetments or losenges to great personages on their journeys, or at certain seasons; or pastry of elaborate ornament as royal new year's gifts.* Many curious instances of the latter custom will be found in the lists of new year's gifts made to Queen Elizabeth, of which the two following may here be adduced in illustration, as they include sweetments, preserved-fruits, and pastry:—" 1562. By Revell, surveiour ut the works, a marchpane, with the modell of Powle's churche and steeple in paste. By John Hemingway, policary; a pott of oringe-condytt, a box of pyue-com-fytts, musked, a box of manus-christi, and lozenges."

Before this period the practice of the confectionary art had ceased to be confined solely to the compounders of medicine, and its productions had long since been regarded as belonging rather to festivals and banquets than to the dictaries of the sick. The delicacy and rarity of the articles used in confections, and the neat dexterity required in preparing them, probably suggested it as a most graceful female employment; hence we find that, in the seventeenth century, the art of making sweetments became established as a fishionable feminine accomplishment, and was publicly taught both in France and England.

Manufacture of Comfits and other Bonbons,

The following is a description of the processes employed at the numufactory of Mr. Schooling (114, p. 796), one of the Exhibitors, of Bethnal-green, the workmen being chiefly French.

Smooth-Confits.—The preparation of comfits is very

simple. If seeds, such as almonds or carraway-seeds, are to be made into comfits, they are placed together with a eream made of sngar-syrup and starch, into a flat ellip-soidal copper pan, suspended by chains over a charcoal fire. By tilting the pan up and down, and at the same time giving it a circular swinging motion, the seeds are made to roll one over the other, and thus gather the pasty mixture as it dries. This operation is repeated as often as may be required for the seeds to accumulate a sufficient thickness. The form of the seed governs that of the comfit.

Peurled-Comfite. - Cinnamo coriander-seed. rearres-compile. — Cinnamon, corrander-seed, and celery-seed are usually "pearled" by placing the mixture of syrup and starch into a copper funuel, suspended over the pan containing the comfits or seeds. This found is, in shape, like the small half of an egg, and has a round hole in the bottom, which is more or less closed by a long conical stick, suspended to the handle of the funnel, and passing through a guide to keep it central. By allowing the plug to descend safficiently, it may be made to close the hole. The aperture is regulated in such a manner as to allow the mixture merely to fall in drops; at the same time a short jerking motion is given to the pan. The poste, as it dries, gathers on the comfits in little knobs, called pearls.

Machinery for making Comfits.-Mr. Schooling employs the fullowing simple contrivance. An endless band, formed of strips of iron hoop riveted on two leather strips, traverses over four rollers, so placed that their axes, when seen on end, form an irregular square; the top roller at that end towards which the band travels being much higher than the top roller at the opposite

where also medicines might be properly cumpounded, and in order that it may form a sort of bag to contain the materials, by drooping between the top rollers; the frame of the machine forming the ends of the bag. A coil of steam-pipes, following the curve of the band, serves to dry the comfits, which are gathered with a rolling motion up towards the highest side, and then rolled over in n

contrary direction. Another Exhibitor, Mr. WOTHERSPOON, of Edinburgh, 106, p. 796), employs an apparatus consisting of a steam pan, open at one end, and revolving in a vertical direcion on a hollow axis, through which the steam passes in, and the condensed water passes out. This pan is in shape like an orange, supposing a horizontal axis to be placed in the eye, and a disc of about a third part of the diameter of the orange to be eut out of the rind at the side opposite to the axis; and in order to complete the simile, supposing the rind to be hollow so as to contain steam. The seeds and symp are placed at the open end, and by the slow revolution of the copper-pan are gathered up and rolled over in the same manner as on the

endless band Messys, Oudard, Son, and Boucherot, of Paris (1374, p. 1242), also manufacture comfits by steam-machine and have done so since 1841: before this period a skilful workman could make from 45 lbs. to 55 lbs. per day, but at present he superintends six pans, each of which produces 112 lbs., so that in a day he manufactures 6 cs t., or twelve times as much as he could produce by hand. This machinery having been adopted by other Parisian

confectioners, has caused a reduction of 30 per cent. in the price of comfits in France. Sugar-Pastilles are made of a paste of powdered sugar and syrup, combined with such flavouring and culouring matter as may be required. A small quantity of this paste is heated over a charcoal-fire, and then placed in a sponted ladle. By inclining the ladle a small quantity onzes out at the spout, and is cut off with a wire; the drop, as it falls on a tin-plate, forms a flattened semiellipsoid; as soon as the tin plate is covered it is removed to the drying-stove. A single workman, in this way, can

make three ur four hundred-weight of pastilles in a day.

Jujubes are composed of a mixture of gum-mucilage and syrup, which is run into flat tin trays, and consolidated by evaporation in a chamber heated by steam. As soon as the cake has been sufficiently dried, it is allowed to cool, and is then cut into long strips by passing it through a pair of rollers, the bottom one being a plain cylinder, and the top one composed of a number of discs placed on an axis and kept apart at the required distance by collars; the strips are afterwards out transversely with

Motto or Surprise-ants are made by drilling out the

thick end of the nut with a rose-cutter running in a

lathe; the kernel is then removed, and the shell filled with mottos and comfits, and lastly stopped up with cho-colate. Many tons are made annually by Mr. Schooling. Liqueur-Bostons.—The manner of making liqueurbonhons is nearly the same, whatever may be their shape. A syrup is made with water and sugar, and is then taken a little at a time by the workman, who evaporates it to the proper consistence, and adds alcohol or some alcoholic In the mean time his assistants have prepared several moolds, by filling shallow trays with powdered stareh, and impressing plaster-of-Paris models of the required furm into it, so as to produce corresponding depressions. Several models are fastened on a rod, and thus a number of matrices are made at one operation. The workman then takes a portion of symp, and runs it into the moulds either from the egg-shaped funnel, before spoken of, or from ladles having several sponts, according to the nature of his work; the latter being used for small drops, the former for large boubons. The cohesion of the syrup being greater than its attraction for the starch, it runs away from the latter as water does from an oily sur-face; and the upper surface thus takes a spheroidal form-A little stareh is now sifted over the surface of the mould, and it is then set aside in a warm closet. Crystallization commences on the outside of the bonbon, and forms a erust which encloses the syrup: this gradually yields more and more of its sugar, and becomes itself more dilute.

^{*} This custom is still kept up in France, as regards the presentation of boacs of sweetmeats on the first day of the new year; and will be noticed in speaking of the contributious from that country.

of boubons per day. Liqueur-Atmonds, - Almond-shaped liqueur-bonbons, which contain a syrup, are enveloped with the white mixture in the same way as smooth-comfits; but in order that they may not be destroyed in the operation, they are first covered with gum-mucilage, and then thrown lote a mixture of gum-arabic and sugar reduced to a fine powder: they are afterwards dried, and again submitted to the same operation as often as is necessary to produce a coat-

ing of the desired thickness. Solid Swear-Boolous are cast in the same way, but with a much stronger syrup.

633

Gem-Drops. - Gum raspherries are made of syrap and on-mucilage; they are cust in the same manner, and dried to an elastic solid.

Fondants, which melt like ice in the mouth, are likewise run into starch-moulds; they are composed of a syrup, which is first evaporated to a certain point of concontration, and then beaten until it forms a frothy paste. Crystallized Bosboas. - All the different kinds of sweet-meats hitherto described are sometimes covered with a

crystalline coating of sugar, by putting them into a strong syrup contained in shallow trays placed on shelves in a drying-chamber heated by steam. A piece of linen is laid on the surface of the syrup to prevent its forming a crust; and by lifting this linen from time to time, the progress of the operation is ascertained; this usually occupies from one to two days. The excess of syrup is drained off in the same room, as soon as the sweetments are sufficiently covered with erystals of sugar; they are then removed and air-dried.

Florers, Piping.-All piped ornaments are composed of a mixture of white of egg and sugar, which is called For the modelling of flowers the workman "clazing." uses a series of supports which, at the upper part, are of the flower; a depression being made in the summit to snit the shape of the calyx. The modelling-tools consist of a series of small funnel-ends not much bigger than a thimble, with openings of various shapes; as for example, narrow sits of different breadths, and round and other shaped holes of various sizes. These funnel-ends are snaped holes of various sizes. These funnel-ends are fastened with gam to the bottom of paper funnels, into which the workman places the glazing, and then closes the funnel by doubling over the paper. By pressing the paper funnel with the thumb, he squeezes out just what he requires; and hy desterous manipulation. he requires; and hy dexterous manipulation, curls and twists it into any form he chooses. This operation is called piping, and is much employed in ornamenting

bride-cnkes. Painted Bosbour .- Boubons intended to be painted are overed with a layer of glazing, and are thea ornamented ith colonned piping. The last fluish is given by paintwith coloured piping. The last fluish is given by point-ing them with body-colours, mixed with gum inucilage and syrap. The nature of the colours will be described hereafter in speaking of the contributions from France.

Manufacture of Chocolate-Confectionary. The following is the method practised by the Pants Chocolate Confasy (France, 873, p. 1221), who in Class VI. have exhibited their machinery, which was made by M. G. Hermann, of No. 92 Rue de Charenton,

Paris. The cocon or eacao-nuts, are first screened to remove any dust, and are then reasted in a cylindrical or globular vessel, which revolves over a fire; the operation of roast-

ing being one requiring much care and attention. After roasting, the husk is beaten off by means of a winnowingmachine. The roasted nnts are now placed in a tritu-rating or mortar-mill, encased with an outer lacket, and heated to 50° C. (122° F.) by means of steam; by the action of this machine they are reduced to a thic paste, on account of the large quantity of oil which they contain Sugar previously separately ground in a similar, but cold, mill, is now added, and the action of the hot-mill conthough until it is well mixed with the cocon paste; vanilla is also added if the chocolate is to be flavoured with it. The thick paste of sugar and cocon is then levigated to the utmost degree of fineness, by means of a mill formed

of three rollers working in a horizontal plane; the second cylinder revolving at twice the speed of the first, and the third at twice the speed of the second. The chocolate-paste is put into a long framel or "hopper," fixed over the two first rollers, which draw down a certain quantity on their surfaces, and by their mutual pressure, and dif-ference of speed, spread it into a thin and even conting. The third roller, by working at a still quicker speed, produces a farther grinding of the paste, which is scraped off by a ductor-knife and returned once or twice to the mill. A coil of steam-pipes placed noder the machine prevents the cooling of the paste during the operation.

The manipulations of chocolate for confectionary are

very similar to that already described for sugar-confectionary,

UNITED STATES OF AMERICA.

The preservation of soft fruits in brandy is an art of some importance in the United States, and one which every year is becoming better understood. The peach is the favourite conserve, large quantities of which are annually prepared, chiefly for home-consumption; but from the experience which the Exhibition has afforded of the possibility of sending them to England in a state of perfeet preservation, there is but little doubt that they will soon traverse the Atlantic. The white Heath-peach is that descreedly most esteemed. Two American Exhibitors have sent Brandy-penches,

BRITISH COLONIES.

Canada sends an nuimportant contribution of confectionary, consisting of Horehound-eardy, reputed in Canada to be a most excellent specific for a cold; a merit which an experiment did not confirm : and also another of Raspberry-vinegar,

From the Cape of Good Hope there is a collection of yeral kinds of conserved Fruits, which for the most part were found to be in a good state of preservation. Some are in syrup, and others partially dried. Van Diemen's Land has contributed Raspberry and Current-jam, Green gooseberry-jam, Red gooseberry-jam, and Quince-jam.

Curva

The only description of confectionary in the Chinese section is the Fioger-citron (Citrus surcodaetylus) preserved n syrup. Large quantities of sugar conserves of various kinds are, however, made in China, and it would have been interesting to compare them with those from other countries: jams, jellies, dry-conserves and syrups, are such as most resemble those of Europe; but besides these, are preserved seeds, as the Millet seed; roots, for example, the root of the Nelminium, and the young tender shoots of various plants, as the bamboo,

The trade in these preparations is very extensive, both at Canton and Ningpo; and from the town of Foo-teheon 44,000 lbs, were exported during the first half of the year 1846.

The contributions from Egypt are very interesting, as representing not only the confectioner's art in Egypt at the present time, but also as offering to our view conserves probably identical with those of ancient history: they consist of Dates preserved in honey, from Two Exhibitors: one description is a preserve in chrifted white, the other in dark-coloured honey. Besides these, there is a small quantity of Sugar-candy.

PRANCE.

The preservation of fruit in sugar, and the manufacture of sugar- and chocolate-confectionary, are highly important branches of industry in France; important, not only from the number of workpeople immediately employed in these manufactures, but also on account of several tributary arts connected with them, which occopy even a far greater number. The artist, the lithographer, the eolourer, the varnisher, the paper-maker, the pasteboard-maker, the die-sinker, the embosser, the fancy-braid-maker,

Etude Pratique du Commerce d'Exportation de la Chine, par Natalis Hondat, pp. 69, 70.

the gold-and-silver-beater, and even the silk-weaver, are all more or less dependent on the demand for fancy boxes and "cornets" to contain bonbons and fruit; indeed, the trade of fancy-box making owes its existence to the wants of the confectioner, who is still its chief patron. Other trades, appreciating the convenience and attractiveness of a pleasing envelope, have adopted boxes for most of their small wares; and "Cartonage" has now become quite gigantic in its development, employing upwards of two thousand artisans, both male and female. Paris is the chief centre of the manufactories, which, for many months towards the close of each year, are all husily employed in preparing the enormous quantities of boxes, mostly distributed in a single day, the first of the new year, to the ladies of France. Many of these boxes cost the confectioner from 12s, to 40s, each, and when filled with confectionary, sell at enormous prices. The greater part, however, cost from 2d. to 2s, 6d. The preservation of whole fruits in sugar is carried on chiefly in the southern parts of France, by small collectors, who forward their produce to their correspondents in Paris, The Parisian confectioners then re-select them, cutting some into ribands, rings, and other fanciful forms, and arrange them in boxes for sale. Paris. on the other hand, supplies boxes to the departmental collectors, who not up in them their fruits for exportation. It is mainly owing to the great taste which the French display, not only in the boxes, but also in the arrangement of the fruit, that they have gained almost a monopoly in supplying the world with conserves: the selection of the fruit and its perfect preservation, however, are points which are carefully attended to, so as to perpetoate the reputation of the goods which an attractive exterior first brings into notice. Eight Exhibitors have sent fruits preserved in sugar, chiefly in syrup.

Chocolate Confectionary is entirely of French invention,

Checkutz Copicionery is unitryly of French invention, and in the kind of revolution most externed in Praces, and in the kind of revolution most externed in Praces, and give employment to about four hundred workpeepis, and give employment to about four hundred workpeepis, and give employment to about four hundred workpeepis, because the contract of the machinery one proposed of the present polycome in the presen

in the French section.

tastefully to introduce a looking-glass. No house enjoys a higher reputation in Paris than its single representative of this art in the Great Exhibition. In 1850, the exports from France, of syrups, sweetments, marmalades, jellies, and fruits preserved in sugar amounted to 98,3350lbs, in value 36,000.

The Freuch confectioner is not permitted to employ any substance he chooses, either in the manufacture of his sweets or the colour he uses to adoru them; the Minister of Agriculture and Commerce very properly interfering. He directs that the Prefect of each town shall carry or in a proper manner, the instructions which have been laid down hy scientific men; not only as to the materials employed, hat also as to the coloured-papers used to envelope the sweets. These regulations, it will be observed, are very similar to those which were established for the government of the Apothecary-Confectioners of Germany in the fifteenth century; and it would be well if England took a lesson in this respect, and appointed a competent staff of chemists to examine from time to time the sweetmeats which are exposed for sale in the retail-shops. The following list of colours, allowed by the French

The following list of colours, allowed by the French authorities to be used by confectioners, may be found of service to makers of sweetments in other countries:— Blues.—Iodigo dissolved in sulphuric acid; Prussianhlue; to which may be added Ultramarine, as preferable

to Pressian-hlue.

Reds.—Cochineal, Carmine, Carmine-lake (provided it contains no vermilion), Brazil-wood lake.

Vellors.—Satfron, French-berries, Persian-berries, Quer-

Pellows.—Satiron, rener-berries, Persan-berries, Quereitron, Turmeric, Fustic, and the aluminous lakes of these substances.

Green is produced of different shades by mixing the

various yellows and blues; but no kind of emerald-green must ever be employed, as it is a virulent poison. Violet.—Logwood alone or mixed with hronne-blue (Chinese blue), in various proportions, Panay-colour.—Carmine and Prassian blue; or Carmine

and Utramarine mixed in various proportions.

Colours for Liqueurs.—Curaçon is coloured with Brazil
wood; blues are made with indigo prepared by adding
alcohol to the sulphuric solution of indigo; and absinthe
(wormwood) is inted with a mixture of saffron and alcoholic indigo.

INDIA.

India sends a few Preserved-fruits, amongst them some pine-apples; but they have not arrived in good condition.

Poervoa.

PRUSSIA. One Exhibitor sends most excellent Preserves in Syrup

These conserves are an evidence that the art is perfectly understood in Prussia, and carefully practised. There is, like wise, an Exhibitor of Chocolate-confectionary, whose productions, however, are far behind those of France.

RUSSIA.

From this country there has been sent a small collection of various Crystallized fruits and marmadades, prepared in the government of Stoolensky. The collection comprises oranges, green-gaces, apples, cherricks bergamottepears, pine-apples, and marmalates of different kinds, which had come what suffered, here was sufficient evidence of their having been so well preserved as to warmat a frocumble notice being given of them in this Report.

SARDINIA.

From the Duchy of Genoa, several preserved Fruits in Syrup, crystallized sugar conserves, and a small quantity of Dengles, are sent by One Exhibitor, G. ROMANESSO (Sardinia, 82, p. 1395); but, nafortunately, the bottles were so insecurely packed that the syrup had oazed ont, which left the fruits in a bad condition; the fruits in hoxes are, however, excellent. The comfits are well made, hut not count to those exhibited in the French department. The conserves of the Sardinian States are much esteemed, and form an important and increasing article of commerce. In the Duchy of Genon there were, in 1843, 34 confectioners, who employed 146 workpeople, and pr duced 637,190 lbs. of sugar conserves, valued at 34,400/,; in 1846, 34 confectioners, who employed 150 workpeople, and produced 661,457 lbs. of sugar conserves, valued at 36,000...; in 1847, the value of the conserves was 48,000... in 1848, the value of the conserves was 46,8001. In 1843 there were also twelve establishments for preserving fruits in the province of Nice.

SAXONT.

The contribution from this country consists only of a very large collection of Choculate-figures, modelled with very large concession of common and control skill; several of the common subjects are, however, of rather questionable propriety. The quality of the chocolate of which they were composed did not warrant an Award in favour of the Exhibitor, thungh he had made considerable exertions to produce a good display.

Several kinds of Fruit, preserved with sugar and dried, and others in syrup, are sent from Spain by Two Exhibitors. These conserves are partly prepared in the convents, and partly in private manufactories. The quality of the fruit is unexceptionable; bot in Spain, as in Porturnl, there is felt the want of uruamental boxes, in order to set it off to the best advantage,

SWITZERLAND.

One Exhibitor sends a small quantity of Chocolatelozenges of fair quality.

TUNES.

The only contribution from this country is a small unntity of a sweetment, called Kefta, which is made of the dried juice of the grape, and is not unpleasant in

TURKEY.

No distinct Award has been made for the sweetments supplied from this empire, which are very oumerons; for the reason before stated in speaking of soap and candles. The Turkish confectionary has, in many cases, the peculiarity of being flavoured either with musk or otto-of-roses. The most remarkable is a sweetment called Rahatlocoum: it is composed of 1 part of wheat-starch, 6 parts of sugar, and 12 parts of water; these are boiled together for some time, and when the mixture has lost so much of the water by evaporation that it will congeal to an clastic jajube-like mass, it is run into n flat tray and allowed to cool: sometimes blanched-almonds are mixed with it. This preparation, which is of agreeable flavour, is in great repute amongst the Tarkish ladies, from its alleged pro-

repute amongst the Turkish kidles, from its alleged pro-perty of developing those proportions of figure which, in their country, are deemed a most essential attribute of female beauty. Auto 600 mos of Halbatocoma ner made Turkish collections. Ayfu-anjo, prepared from the dried joice of the grape; Ayfu-anjos with blasehed almonds; Pazia, which is also prepared from grape-juice order quite have in this meales; the pulp of the Persian prane when the pulp of the Persian prane (this mis ny no means an agreemote involvir) putacenion unt-confils; roots preserved in sugar and flavoured with misk; very good marmalade of plnms; sugar-candy, pink and white; liquorice-syrup; and, lastly, dried liquorice-juice. Of all these the most agreeable is, without doubt, the Rahattacomm.

UNITED KINGDOM.

mate, large quantities being annually imported from mate, large quantities being annually imported from France (chiefly), Spain, Portugal, and her various colo-nies. The weight of fruits preserved in sugar or brandy, imported from all parts, during the year 1850, was 155,895 lbs., and yielded in daty 3,7541. There is one Exhibitor of foreign Preserved-fruits in the British Nec-tion. English jams, jellies, and orange-marmalade, which are prepared very largely throughout the United Kingdom, are not exhibited, probably under the idea that no interest

would be attached to them. Confectionary is manufactured, in enormous quantities, throughout the United Kiogdom, and more particularly in Scotland. It is not possible to arrive at an exact know ledge of the quantity annually produced, nor even to make a tolerably accurate estimate as to its extent; but it is eertain that two or three tons per week of lozenges are not an unusual produce for one house. From the result of inquiries amongst the sugar-brokers and confectioners, it inquiries amongst the sugar-orosers and consectorers, it may be safely stated that nywards of 150 tons of sugar are converted, every week, into sweetments; at 47f, per ton, the raw material used in one year, therefore, amounts to 366,600/L, to which must be added labour, flavonring, and a wholesale and retail profit. Besides this, 31,977 lbs. of Confectionary are annually imported, and pay a duty of 8401,

The manufacture of Chocolate-confectionary is only of recent introduction into England, and is carried on by Frenchmen and Italians, Two of whom exhibit their apparatus at work in Class V1. There are Three Exhibitors of Chocolate-confectionary in the British Department, One of whom exhibited chocolate quite equal to that made

in France Crystallized Liqueur-confectionary, similar to that of France, is now made largely in England, and is quite

equal to quality, but at a considerably less price than the French. This arises, to some extent, from the difference in the price of sugar, and also because the canesugar is more easily worked, or, as the workman expresses sagar is more easily worked, or, as the workman expresses it, is stronger. For example, erystallized liqueur-beans, dragées, and "drops." of English manufacture are sold wholesale at 8d, per lb., the price in France being its 3d. As wages are considerably higher in England, the difference in price is the more remarkable.

ence in price is the more remarkable.

By far the larger portion of ragar annually devoted to sweetnests is carried off by "pipe," lorsenges, and confidence thins. The latter description is made chiefly in Scotland, which has long been renowned for its confectionary. Machinery is employed, particularly in the manufacture of lozenges, acidalusted-drops, and comfits, so that the wholeadle-confectionare is enabled to sell these that the wholeadle-confectionare is enabled to sell these kinds ut prices but little above those of the raw materials; notwithstanding this, an unfair competition seeks still farther to diminish the price by admixtures of powdered gypsum. The acidulated-drop is a production peculiar to this country, the foreign confectioners not understand-ing its manufacture.

Bride-cakes are not wanting in the World's Great Show, nor should they be; for they are characteristic of English tenseity with respect to ancient customs, and few are older than the use of bread or cake at marriage-ceremonies, which, with the wedding-ring, has been derived from the heathens. The sprinkling of wheat on the head of the bride is a very old custom, and is now occasionally perpetuated by the cutting of the cake over her head. Many other ceremonies are also still retained in connexion with the bride-cake; as the passing of very small pieces of it nine times through the bride's ring, in order that the bridesanids may place a piece beneath their pillows at night, and dream of their lovers. No less than Three gigantic Bride-cakes adorn the conoters of the North Transept Gallery, varying in value from 304, to no less a sum than 1504. One, it is said, possesses the advantage of moveable ornaments, so that after the cake has disappeared, the sugar may be transmitted, like the silkappeared, the sigar may be transmitted, include since the discovering of the sigar may be transmitted, include the grand-mother to her grand-daughter! The Three Exhibitors are R. Gurras (112, p. 796), Moosa and Mariert (332, p. 862), and R. Visk (118, p. 797). Although these bride-cakes were not considered of sufficient importance England derives her supply of fruits preserved in bride-cakes were not considered of sufficient importance sugar from countries more favoured than herself in elimaking these the subjects of a distinct Award, they are here mentioned as being the best of their class. The sugar-ornament of the last-named is quite remarkable as a piece of "sugar-piping." The number of British Exhibitors of Sugar-confectionary

is Eleven. There are likewise Two Eshibitors of Confectioners'-ornaments, and Three Exhibitors of Biscuits.

To judge by the contributions to the Exhibition, the forte of the Wurtemburg confectioners is rather in the production of non-edible ornaments than confectionary itself; there being Three Exhibitors of the former, and only One of the latter. The confectionary which is erystallized is, however, excellent,

The number of Exhibitors in this subdivision is Sixtysix; of these there are:-

17 Holders of a Prize Medal. 5 Who obtained Honourable Mention. 44 Unrewarded.

The elassification of Exhibitors, according to the various countries, is as follows:-

LIST OF AWARDS.

ALVARGONZALEZ, R., Oviedo (Spain, No. 177, p. 1340), Prize Medal. - Fruit exceedingly well preserved in syrup; comprising Greengages, Peaches, Apricots, and Strawberries.

AUCLERC (Widow), and P. LEBOUX, Paris (France, No. 1059, p. 1229, Prise Medal.—For an assortment of Prenet Comfits, Liquen-bonbons, and Pastillor-figures

(composed of sugar and white of egg, or sugar, gum, an starch). The bonbons are arranged with great taste in fancy boxes and corbeilles, and much skill is displayed

in fancy boxes and covicilies, and much shill it displayed in the modelling of the pattillage-figures. Baxa Baornaras, Bhersch (Wurtenburg, No. 87, p. 1119). Prize Medal.—For a very estensive collection of Confectioners'-ornaments, many of which are very humorous. They are composed of gum-tragacanth and starch, so that, if esten, no ill effects would arise, but they are luteraled only as ornaments. The largest piece represents the cathedral of Cologne, and contains a musical-box. In Germaoy, storks are reputed to bring newly-born infiants, and we find, necordingly, one of these birds carrying a child in a small box strapped on his back.

Castellas, F., Lisbon (Portugal, Nos. 422 to 425, 426, 428 to 433, 438, p. 1312), Prize Medal,—Figs, Plums, Peaches, and Pears as dry conserves; Sweet-plants, Apri-cots, Tangerine-oranges, Figs, Cherries, and Peaches pre-

served in syrup, with their natural flavour and perfectly

CHEVET, jun., Paris (France, No. 121, p. 1177), Prize

CHEVAT, Jun., Parts (Frames, No. 121, p. 1172). Prize Medal.—Cherries, Pears, Apricots, and other fraits preserved in syrup. These are of the highest class, both as regards the cloude of frait and eareful preparation.

COLMBA, The NENNINY of (Forugal, No.417, p. 1312).

Prize Medal.—For a large and tastfully-intraged box of

Conserved-fruits in great variety, and in the highest state

Conserved-truits in great variety, and in the highest state of perfection.

Foarsow, Mason, and Co., Piccadilly (Class III., No. 55, p. 204), Prize Medal (the same Award by the Jury of Class III.)—A very extensive collection of the fluest Preserved-fruits of various comments. bestowed in the selection and arrangement of this (the largest) collection of costly conserves, the Jury has awarded the Prize Medal. Loudernack, M. J., Ciucinnati (United States, No. 7, p. 1433), Prize Medal.—W hite or Heath-peaches preserved

in brandy, of delicious finvour, and in a perfect state of preservation. The name Heath is derived from the sur-

Oudland, L., Sox, and Borchead then.
Oudland, L., Sox, and Borchead, Paris (France, No. 1374, p. 1242), Prize Medal.—For the care in selecting, and taste in arranging, in ornamental forms and in boxes, a great variety of Preserved-fruits; and for Comfits

and Sugared-almonds of excellent quality.

Pans Circcolari: Company, Regent Street (Class III.,
No. 30, p. 202), Prize Medal.—Awarded for most excellent Chocolate-confectionary, in a great variety of forms, all of which was found to be carefully prepared and well-flavoured; and also for an assortment of Syrups, which on dilution form very agreeable and refreshing

Permon, E., Paris (France, No. 343, p. 1193), Prize Medal (the same Award by the Jury of Class III.)— Chocolate-confectionary, prepared in granite mills, and torrefied by steam. This preparation is exhibited in a great variety of forms; amongst other matters, there is a Basket made of chocolate, filled with Chocolate-boubous, which are well flavoured and of most excellent quality.
Philippe and Canaud, Nantes | France, No. 956,

p. 1225). Prize Medal,-Excellent Fruits preserved in syrup, and comprising Penches retaining the deliency of their flavour, Pears, Rasphorries, and Cherries, all of which are free from any signs of fermentation.

Rodel and Sons, Bordeaux (France, No. 992, p. 1226), Prize Medal, for a collection of the following fruits, per-fectly preserved in syrup, viz.:—Cherries, Pears, Aprieots, Greengages, Raspberries, Penches, and Strawberries, which have retained their natural flavour, and are free from fermentation.

Rotu, W., jnn., Stuttgart (Wurtemburg, No. 89, p. 1119), Honourable Meution accorded for a large col-lection of well-mannfactured Liqueur-bonbons, both eyys-

tallized and smooth, ST. PELAYO, The NUNNERY of Oviedo (Spain), Prize Medal.—For a collection of Marmalades of excellent flavour. They are of firm consistence, and are pucked in thin round boxes

SCHOOLING, H., Bethnal Green (Class XXIX., No. 114, 796), Honourable Mention,* for Liqueur-bonbons agre ably flavoured and in every respect well made, crystal-lized and smooth, generally known as French sweetmeats. Some of these are flavoured with artificial essences. (See

page 637.)
Taooles, G., Ulm (Wurtemberg, No. 91, p. 1119),
Honourable Mention is accorded to this Exhibitor, for a Confectioners' Ornament, representing a Liou-hnnt, well modelled in gum-tragacanth, sugar, and stareh, and

eoloured with vegetable-colours.

Turens, F. A. (Widow), Paris (France, No. 1046, p. 1228), Prize Medal (the sams Award by the Jury of * But for a misstatement contained in n label attached

to these productions, by which it was made to appear that they were manufactured in France under the immediate they were manuscured in resuce under the manuscular inspection of the proper authorities, a Prize Medal would have been awarded to Mr. Schooling. The Reporters are now enabled to state that the employment of this label Lan been discontinued.

Closs III.), for a large collection of very excellent and carefully prepared Chaoolate-confectionary, made up into drayers, and representing fruits and rrots; for instance, potatores, natts, cleanurs, turnips, radialises, dates, black currants, bips, and plums; all of which are imitated with skill.

Volsteret, J. P. (Cape of Good Hope, No. 35, p. 950). Honourable Mention is accorded for the following conserves, which are exhibited both in syrup and in the candled state, vir.: Nartjes (a small orange), the Bitter-orange, Green-figs, and Cirrons.

oranige, overen-ups, and Carriota.
Warrinzary, H. (Thas III., No. 27, p. 202), Honourable Mention.—Sugar-drops, flavoured with artificial state of the control of the contr

WILL, C., Berlin (Prassin, No. 20, p. 1049). Prize Wall, C., Berlin (Prassin, No. 20, p. 1049). Prize Medal (An Honourable Mention accorded by the Jury of Class III).—Whole Pine-apples, Penches, Apricots, Pears, Pinas, and Walants in the basks, preserved in syrup. The soft fruits have retained their natural flavour, and are quite free from fermentation.

WOTHERSTOON, J., and Co., Glusgow (Class XXIX., No. 106, p. 796), Prize Medal.—Very excellent Nootherconfectionary, manufactured by steam machinery, and consisting of eighteen kinds of Lowrages and several descriptions of Counits, which were found to contain no other material than sugar, starch, and vegetable-colouring.

.—MANUFACTURES RELATING TO NATURAL HISTORY.

I, ARTIFICIAL FLOWERS AND FRUIT.

Under this general designation two very dutinet classes of articles have to be separably considered, namely, laninative Flowers and Frait, modelled in war, and the same adjects formed from other nativeliat. The Max-flowers, cation to purposes of decoration, and require less difficult manipulations for their nacescall prediction than those made of cambrie, feathers, or similar materials, and decmanded the second of the second of the second of the processing of the second of the second of the second powers, excangular used as articles of tolde.

In examining the Wax-flowers, which are usually intended to form isolated ornaments, we require truthful initiations of Nature, and taste in the selection of forms or grouping, the manufacturing skill required resolving itself atmost wholly into the execution of form and the application of colours.

In the latter class, however, are included those predections to which the term 'Artificial Process' in small times to which the term 'Artificial Process' in State of the Artificial Process and the Artificial Process and the Artificial Process and the Artificial Process of their manufacture. Accuracy of form symmetry of the Artificial Process and the Artificial Process and Translated for the instantos of the Artificial Process and Translated for the instantos of the Artificial Process and Artificial P

production.

Such are the principles by which we have been guided in the examination of the several specimens of Artificial Flowers submitted to the Jury of this Class.

AUSTRIA. The contributions from Anstria are sent by two Exhi-

bitors, both of whom display small collections of chenp Miniature-flowers, in which the trifling cost is the chief

BRAZIL

The contributions from Benzil are only four in number, and undoubtedly the most beautiful of them is that

belonging to Class XXIX, consisting of a splendid lenguet of Feather-flower, including the Coffee, Cotton, and Tolocco-flowers, &c. The name of the mannfacturing artist was not stated; but an Award has been under in Evour of the Exhibitor, who is an Englishman

BRITISH COLONIES AND CHANNEL ISLANDS.

Many of the examples exhibited by the Dependencies of Great Britis have an especial and a very high interest attaching to them, since they may be supposed to reperent with sufficient necuracy a great variety of plants and fruit presently unknown in Durope. It must be conceided that the manufacture of Cambricevir is a purely French or, to spex a more correctly, better in a control of the control

* It is estimated that the selling value is nearly double this sum.

silks, &c., supplied from Lyons, St. Quentin, and St. Etienne, there have been distinct manufactories estahlished for many others of the component materials of these graceful ornaments. Thus the Dyes and Bodycoluurs are prepared expressly for this art by mannfac-turing chemists; the materials, as Coloured-papers, Buds, Leaves, Stamens, Pistils, Fruits, and similar articles, are nsually made in workshops devoted exclusively to their production; and in some instances, as may be seen by production; and in some instances, so may be the contributions to the Exhibition, only one description is made in one manufactory. In 1847 there were Purtyeight manufacturers of such materials in Paris, who emplayed 478 workpeople, and produced goods valued at 47,1561. The flowers are composed from their separate component parts in other workshops, some of which have a reputation for one kind only; and lastly, the grouping together of the various flowers is effected in the warehouses of the vendors, who are termed "monteurs," of whom, in 1847, there were 574 in Paris, who employed 5,675 wurkpeople, and produced goods to the value of 395,070f. It must, huwever, be stated, that there are some manufactories in which by far the greater number of these operations are carried on. In most cases, however, each workshop is restricted to the exercise of some particular branch. This will be more readily understood when it is stated that there are no fewer than Six handred and twenty-two manufactories in Paris (including the forty-eight preparers of materials before named), which on the average annually produce goods amounting in value to 711, supposing the total production equally distributed between them; but this is far from being the case, for in 1847,-

In 1847 there were 6,153 workpeople employed in cambric-flower making, namely:—

The men earn, on the average, 3s. per day, the women is 7d per day: the yanths and girls, being mostly apprentices, receive, in most cases, no remuneration beyond their board and lodging.

their board and fullering.

The feathers are also executingly good. p. 1212). Print TLIAM, p. 1212). Print TLIAM, p. 1212, Print TLIAM, p.

II, TAXIDERMY.

The art of stuffing animals is generally supposed to be an invention of modern date, and to have originated about the period when the various museums of Natural History were founded in Europe. But traces of the are are to be discovered in the earliest records of antiquity, although the methods then employed differ much from those now practised. The procedure of the ancient Egyptians in embalming human remains and dead aniin some measure resembles the manipulations of the taxidermist, inasmuch as in both the parts peculiarly anhiert to decomposition are removed and replaced by more durable materials. But whilst the Egyptian embalmer desired rather to preserve the substance of the body than its form, the taxidermist sacrifices all, except the skin, to the obtaining of a natural representation of the aspect of the living animal. 'The ancient Greeks and Romans, however, endeavoured to preserve the form and Romans, however, endeavoured to preserve me form as well as the substance of the body, but their methods fulfilled the object very imperfectly. The ordinary proceeding consisted in immersion in melted wax, or in honey; this necessarily disguised the shape, even though it remained unimpaired. Perhaps the best of the ancient methods for the preservation of animal subthe ancient methods for the preservation of a namna sun-stances consisted in placing them in a solution of common salt; this is still done, though for very different purposes. In this manner the sow, which by bringing forth a litter of thirty pigs, afforded a happy omen to Excas, was preserved by the priests; and it kept so well that it was said to have been in existence at Lavinium in the time of Varro. In the same way were preserved two hippocentants (probably moostrons births), and also an ape, which, having been sent by the Indiana to the Emperor Constanting, happened to die on the

It appears to have been the huniness of the priests to preserve rare animals, or rare natural specimens generally, and this was so prevalent, that we are almost tempted to refer the origin of muscums of Natural History to temples of antiquity; indeed Beckmann, in his History of Interations, onotes a number of instances which summer this view. And although it cumot be positively asserted, from the nutleus in the Greek and Latin nutbers on the subject under review, that methods recentiling those morses. The control of the control of the control of the subject under review, that methods recentiling those morses. The control of the control of the control of the subject to the complex, shows that they were not invariably quently have possessed methods of preserving animal substances in the day state; but they appoor to have been ill adaptive to the purpose, for the beard of the celebrated in the control of the control of the control of the control temptes of Greece, had evidently suffered by time, or the ranges of Greece, and had bott the greater part of its

The urt of preserving animals appears to have been but little, if at all, practised during the middle ages; for we only now and then meet with a notice of natural objects being kept as curiosities in the treasuries of emperors, kings, and prioces. It is only in the records of the period when the study of astural science was of the period when the study of natural science was resuscitated that passages are to be met with indicative of a knowledge of taxisicramy. Sportsmen had undombi-culty practised it much earlier, in a rough manner, for the purpose of making efficies of call-birds, in the obserner of the living hird, while they imitated the note of the hird with their own voice, or some artificial contrivance. The first records of collections of objects of natural history relate to the second half of the sixteenth century, and it appears from them that such musenms existed chiefly in Italy, in relation to which the name of Francesco Calcrolari deserves especial mention (Verona, 1584). These collections, which were commenced by private individuals from purely scientific motives, increased in number and importance in the seventeenth century. This period gave birth to the collection of the Tradescants father and son), which was purchased in 1659, by Elias Ashmole, who presented it in 1683 to the University of Oxford, and thus founded the Ashmolean Museum; and also to the collection of James Petiver, which was much enriched by Sir Hans Sloane, and, on the death of this distinguished naturalist, became the uncleus of the British Museum. It is from this epoch, in which the majority of continental collections took their origin, that the art of preserving skins must be dated; and from the moment it became subservient to science, it kept pace with the growth and requirements of these institutions.

It is a point of extreme interest to compare the admirable productions in taxidermy contributed to the Great Exhibition, with the old specimens of the art of naimalstuffing to be met with there and there in the museums of antural history. Nothing move disaminar can be imagined;

naurai nistory. Autoing more classmine can or imagined; for while the successful productions of modern times pre
"In one of the Epistles of Homee (Epist, lib. I., Epist, 2, 1, 63), addressed to Lellins, a passage is met with, which has been exernally constructed into a knowledge of Taxildrany

among the ancients. The words are-

Venations, ex quo Tempore cervinam pellem iatravit in suia Militat in silvis catulus.

Many interpret pulls cervino as a sinffed stag, placed in the hell, and barked at by the dog. This explanation assumes that the sucients decorated their halls in such unner; like a modern hunting-box. The passage is, however, intelligible if we translate pulls cervina as the mere skin of the stag.

of he-size, the foregoing details suffice to show that the series of taxolerum cannot finate how regressionally extracted the series of taxolerum cannot finate how regressionally extracted the structure of taxolerum cannot for the structure of the special control force of the said to have regressive force of the said to have been sufficient to the said to the said to have been sufficient to the said to the said to the said to have been sufficient to the said
sent Nature to our eyes, and show that the artist has closely studied ber hidden secrets, the animals of the old studiers resemble anything but their wheel secret are interested to represent. It would appear that the study of nature was not deemed to be essential, and that imagination took to place, and was allowed great latitude in the parting up type would have recoiled in horror from the contemplation of its defanct representative.

The older taxidermists had, evidently, to direct their entire attention to overcoming the difficulties presented by the material, the preservation of which was the main point. At first they contented themselves with removing the intestines and the brain, especially in birds; they attempted to prevent the patrefaction in the remaining parts, by exposing the bodies to a gradually increasing temperature for the purpose of expelling all the water. But however carefully the drying was attended to, it is evident that these productions were of an ephemeral character, as they presented a tempting buit to many descriptions of insects. An improvement was next effected hy removing the large fleshy muscles, the entire skelcton still remaining. At present, the skin slone is employed; all parts that rapidly andergo patrefaction being carefully removed. By this means, and by the aid of modern chemistry, which has yielded a series of useful preparations to the toxidermist, the putrefaction of the stuffed animois was prevented. The operator was consequently annihols was prevented. The operator was consequently enabled to direct his attention to other points of great importance; and from the moment he was freed from anxiety respecting the preservation of his subject, he strove to perfect his mode of representing nature, and thus completely altered the range of his art. The skin thus completely altered the range of his art. The skin of the animal has now become, in the hands of the taxidermist, a crude material to be endowed with form, and life-like attributes, as the marble under the chisel and mallet of the sculptor; and unless, like him, he prepares bis mind by anatomical studies, and a close observation of nature, he will surely fail to realise a satisfactory production. The Works of Art exhibited—for to many of the specimens the term may be well applied-prove that animal-stoffing has been cultivated with unequivocal anccess in this direction.

UNITED STATES OF AMERICA. The exhibitors are two in number, one of whom sends

a black-eyed squirrel, and the other a case of animals, birds, and fishes; but neither of these contributions calls for especial notice.

BELGIUM.

The contribution, which comprises a case of stuffed birds indigenous to Belgium, and also a case of stuffed foreign hirds, requires no especial notice.

Better Colores

Britist Griess—Mr. A. P. Rizzwer, Privis Guine, (16-41, 197). A think a case of safeth brids, compiling—the towards, blue gaser from Ecosyulls, and (16-41, 197). A substitute of the control of the cont

specimens are of great interest, not only from their number (forty-two) and the beauty of the examples, hat also from the evidence they afford of the cultivation of science by the officers of the British Naty. Hesters Africa.—HES GRACE THE DUCHES OF SCHIESLAND (16, p. 954) exhibits a case of hirds from the river Niger,

FRANCE

It is much to be regretted that no contribution has come from France. The attention and the chemical and acientific research bestowed upon this art by French naturalists, Bécœur of Metz, the inventor of the metallic-scap,* Fontenelle, Dufresne, and others, and the value of their writings is well known to naturalists; and it would have been interesting to compare the present condition of the art in that country, with the progress which has been made elsewhere,

SAUDINTA.

The only contribution is an elk from the Zoological Museum at Turin. This specimen is most remarkable. It exhibits to perfection the art of representing the living animal, not only in its general form and character, but marking also the fine and delicate undulations of the flesh marking also her but and certain distances and muscles, and all the matemical details which are externally traceable. The difficulty of effecting this is so great that generally it is scarcely attempted; but in the present instance the artist has been most successful. The present instance the artist has been most succession. In process adopted by Sig. Cowna, 1(83, p. 1305), the exhibitor of this specimen, has been that of modelling the animal in elay, and from that model forming a mould; this mould enabled him to construct a figure of a material resembling papier-maché, retaining all the fidelity of the original model; upon this figure the skin is stretched.

D'XITED KINGDOM

The number of British exhibitors is thirteen, the following deserve especial notice. A. D. BARTLETT (291, p. 817) exhibits an ingenious example of the art in the constructed figure of the Dodo-a hird which was once a native of Mauritius, and found there in considerable numbers at the beginning of the last century-hut now, as far as is known, entirely extinet. The drawings of Savery, preserved in the Belvedere at Vicana, and in the Boyal Gallery at Berlin, and some remains of a skeleton formerly in the collection, already alluded to, of Elias Ashmole, consisting now but of the head and one foot— are the data from which the figure has been compiled. The process is of course very different from that of preserving a real animal, the skeleton and skin of which are entire: an artificial body has to be constructed, and theu covered, feather hy feather, with such plnmage as is most in accordance with our knowledge of the hird. This has been very skilfully executed; and the result, by the testi-mony of Mr. Strickland, and of Mr. Gray, of the British Museum, "represents with great accuracy the form, dimensions, and the colour of the Dodo, as far as these eharacteristics can be ascertained from the evidences which exist," whilst it "does great credit to Mr. Bart-

lett's skill, and to his practical acquaintance with the There are other specimens exhibited by Mr. Bartlett, which are, perhaps, more attractive, inasmach as they re-present nature with a fidelity of which all can judge.

structure of hirds."

* BECKUR'S ARSENICAL SOAP Campbor - - - - -

Campbor - o ounces.
Arseole (arsenious acid), la powder 2 pounds.
Curd Soap - - 2 pounds.
Salts of tartar (carbonate of potash) 12 ouoces. Lime, in powder - -- 4 ounces.

The soap is first cut in small silces, and melted gradually with water over a slow fire, stirring all the time.
When melted, the salts of tartar and lime are added and
well mixed. The mass is then taken from the fire, and the weil mixed. Loss mass is then bases from that nick, and the arrecke triturated with it in a mortar; and, lastly, the campinor is added, after having been separately triturated to powder with the aid of a little spirit of wine. The abt-ture has the consistence of stiff near-paste.—The Art of Taxistency, by Taker Bowell, p. 2.

The pair of Impeyan Pheasants, entitled "Courtable," and the Sleeping Ournog-outan, "Repose," are especially deserving of notice. The fleshy parts of the latter have been very skilfully treated; and the dried and shrivelled appearance which they so often assume is entirely avoided The skeleton of the ourang-outan has been preserved,

and also the viscers; the whole furnishing an example of the manoer in which rare specimens should be dealt with, in order to secure accurate information to the naturalist,

and to promote the advancement of science J. A. HANCOCK, of Newcastle (320, p. 818), exhibits, in the North Transept, some beautiful examples, not only of a faithful and spirited adherence to life and nature, but of a skilful and harmonious combination of forms and co-The three illustrations of Hawking, and the scene in the Tropies, will go far towards raising the art of taxidermy to a level with other arts which have hitherto hadd higher pretensions. The first of the three objects, illustrating the ancient sport of falconry, is the Hooded Hawk, looking lean and hungry, with the strap attached to his leg, by which he is held on the falconer's fist. In the second group, the falcon has struck to the ground, and is in combat with the Courry, a powerful herou, who and is in common with the 'gentry', a powerful factor, who is struggling in vain against the attacks of his enemy; whilst the cd, which, but for the interposition of the hawk, would have been soon decoured by the heron, is quietly making his escape. The third tableau exhibits the grouped falcon: what a contrast is beer presented! the blood-thirsty enemy of the heron is scarcely to be recognized in the drowsy figure: standing on one foot, the nized in the drowsy figure: standing on one toot, the other being drawn up nuder his breast, the eye half clusted, he is the very image of gluttony. The tropical group comprises cockatoos and parrots, disporting in a rich tropical vegetation, glittering (perhaps too much so) with brillian butterflies and bevtles, lizards, and other reptiles. The stolid, heavy, self-satisfied expression of the parrots is well brought out by comparison with the anxiety and trepidation of the Mate of the Dead Gull, in another group; or, with the restless gaze of the Lämmergever of the Alps. The contrast between life and death is also well kept up, by the display of n group of dead game, the ruffled state of the feathers being exceedingly truthful.

C. Gospon (202, p. 801) exhibits a representation of an owl "mobbed by small hirds," in which the action of the owl and of his tormentors is given with great liveliness and fidelity.

Dr. Bezvor, of Newark (204, p. 801), exhibits a dog, prepared much in the same way as the elk contributed from Sardinia, and although not included in the awards hereafter to be enumerated, it is deserving of favourable

J. Leaderater (221, p. 801) exhibits a curious and in-structive collection of Indian gallinaceous birds; and an extensive collection of humming-hirds, comprising about 300 or 400 varieties, in the North Transept, which are

very carefully set up.
T. M. Williams and J. Gardner (219 and 223, p. 801)
exhibit a brilliant assemblage of riehly-plumaged birds from various parts of the world. The productions of these artists are apparently of a class rather for the drawing room than the cabinet of the naturalist. They have selected chiefly those denizens of the air most distinguished for the brilliant colouring of their plumage. So far as the careful preservation of the plumage is concerned, they deserve commendation, but in respect to a delineation of the habits of the hirds by appropriate scenery, they fall short of the excellencies attainable in this art.

WITHTEMBURG.

The collection of H. Ploucquer, Wurtemburg (107, p. 1120) consists of, 1st. A series of scenes taken from Kaulbuch's illustrations of the well-known German story of Reynard the Fox (Reineke Fuchs), and executed with great skill. In these the exhibitor does not of course claim the merit of conception; but the hamour with which the design of the artist is carried out, and the expression thrown not only into the attitude, but into the countenance of each animal, is admirable,

2nd, Groups of birds and small animats in action, designed as well as executed by the exhibitor. Some of tiese also are lumonous, and slow considerable ingenuity, as, for instance — a love-secue, libratived by weader, as the polecut, &c. Others represent the movements or lability of the contract of th

life-tilse execution.

Honourable Mention for a group of stuffed British birds. HAROCK, J., Neveratle (Class XXIX, 320, p. 818). Phize Medal for several single specimens and groups of stuffed hirds and animals, most truthful as to the representation of the habits and appearance of these creatures; and in every respect of the highest merit. PLOCKEGER, III, Stuttgart (Wurtembarg, 107, p. 1120).

Prize Medal for several bumorous groups of stuffed animals; groups illustrative of the habits of birds; and two large hunting pieces.

C, ARTICLES CONNECTED WITH EDUCATION,

I, EDUCATIONAL MODELS,

There is perhaps no subject more deserving of the attention of ealightened persons, nor any means more conducive to the intellectual and physical advancement of a people, than the dissemination of accurate practical know-

ledge among all its classes; and it is one of the most graitfying circumstances of the present age to find many philauthropic individuals endeavouring to smooth the path to knowledge for those whose position in society does not permit of their engaging in a long course of study.

Beyond the mere rudiments of education, no branch of learning is more valuable to the working classes than ap-plied physics and mechanics; and in those departments there are no means better calculated to impress the mind of the student with the great unchangeable laws of nature, and with the construction of the mechanical contrivances by which man renders them available for his wants, than working-models. Under ordinary circumstances, however, these useful aids are unobtainable by the majority of students, on account of their expense. In order to remove as far as possible this impediment, Edward Cowper, Professor of Manufacturing Art and Machinery at King's College, London, has contrived a series of cheap models to illustrate his courses of lectures, with the view of stimulating his students to imitate them. in consequence of their extreme simplicity. Finding that they fully answered their intended purpose, he has since allowed them to be copied by the Society for the Promotion of Christian Kuowledge, for the purpose of their introduction into National-schools. The Society is thus enabled to supply them at a few pence only above their prime cost; and at the same time it also furnishes pamphlets explanatory of the various parts of each model and their functions, so that the teacher may readily acquire and easily impart a knowledge of the subject they are intended to illustrate. For example, a sectional-model of "the working-parts of a steam-engine," 20 inches by 10 inches, is furnished for 7s. 6d. All the parts are moveshle, and the name of each is indicated by a printed label pasted on it; as cylinder, piston, piston-rod, connecting-rod, crunk, fly-wheel, valve-box, side-valve, steam going into the cylinder, steam going out of the cylinder, &c. It would be impossible to estimate how many of the millions of visitors to the Great Exhibition there are who would be thankful for the information obtainable in the North-East Gallery from this and similar resol but valuable models.

II, ETHNOGRAPHICAL MODELS.

Under this title will be described a few collections of small ingrate illustrate of foreign centress and nanmall ingrate illustrate of foreign centress and nanmall ingrate illustrate of foreign centress and nanmall ingrate illustrate of foreign centress and the colcentress of the control of the color of the

extensive series in the Indian Court. It is to be feared that this latter collection will be dispersed with the other splendid contents of the department, before its value can be fully appreciated.

UNITED KINODOM.

The Fine-Art Court contains a collection of very beam cut suppring in instances and statistic feeling, both in the position and grouping. They represent the native of in their popular court, and they begin the character, and the court of t

India

The Figures in the Indian Courts, which have, it appears, been contributed by several Exhibitors, are eith modelled in elay or plaster, or else carred io wood, nod painted to represent the natural colours of the various objects. The largest group, which was contributed by Mr. Mansfield, of the East India Company's civil service, is contained in a model of the "Jamma Bundi," or the encampment of a government collector, whilst moving about on his annual tour through his district (pp. 926, 927). The figures are of plaster, and the buildings of wood The double-poled tent of the collector is pitched at a short distance from the village; and he is represented as sitting within it, surrounded by the "Musletdar," and other rewenue-officers. Several petitioners are congregated around the door of the tent, seliciting a remission of part of the payments due from them. The figures of men and ani-mals are about three bandred in number, and present a lively representation of Indian life and character. Some are indolently lying under the trees, some are gazing at the performance of a snake-charmer, and some feeding an the performance of a stange-charmer, and some recoming elephant; whilst others, more intent on the business of the day, are having their petitions written out by the village accountants, or "Coolhurnees." The village, near which the encampment is formed, is represented inside a fortified wall, which surrounds it, and which is shown in section. There are also to be seen the numerous shops and rows of houses in the village, with the inhabitants engaged in their various pursuits,

their various parasita. Here every a transfer of edge, numbersor to Kokinaplar (p. 2031, representing the various castes and professions that their properties of their properties of their properties. Here, instead is the closed juxtuposition with the glossical stress that the closed juxtuposition with the glossical stress of their properties. The contract the closed juxtuposition with the glossical contract to the contract of the contract to the contract of
pations with the lightning speed of the electric-tolograph, are efficient of the Ambersance, or Bayer of the Government of the Covernment
Less perfect in point of execution than the Kishnaghurs day-figures, but still most interesting, are the models manufactured at Golake (p. 926), which it appears are not made as articles of export, but only to order. This collection comprises about forty illustrations, out of which may be especially noticed, as representing trades, the Custon-printer, the Potter, the Woman grinding ment, the Bengal Water-carrier, or Bhaester, and the Washerwoman,

or Dhobie.

The Models illustrating the practices of the Thug underest excite he most painful interest, and experience of the most painful interest, and experders and emode, has his attention directed to the heavest, when the farm landscribed is appelled by a Thug who when the farm landscribed is appelled by a Thug who succeedfully defeating hismosif from an attack can be part of the Thuge, one of them has shall; in The multilation well, and the stranging of travellers on horselect, and one well, and the stranging of travellers on horselect, and on the stranging of the

prise thirty-five figures in wood from the Rajah of Jodipore; a model of a European court of justice, and also one of a native court; models of a silk-factory and an indigo-factory, of a native oil-mill, and of a farm-establishment (p. 927). A series of male and feamle figures, exhibited by T. E. J. Holl.E.G. (p. 927), represent the principal Section fooding thinks and Travancore.

MALTA.

The Figures from Malta, which are modelled in wax, have not the same claims to merit as those before described, but have still a certain amount of excellence. They represent the Grand Master Valetta, the Grand Master Lonzadari, with the Master of the Order of Malta, and a Knight, in their proper contume (p. 946).

SPAIN.

Three Exhibitors contribute models illustrative of tumaners and drawses of Spain. Two of these send figures in painted terra-contar representing the inhabitants of mercus, though they are remarkable for the beauty and correctness of the modelling (p. 1347). The other Exhibitor has sent a model of one-shadle of the interior of the areas. For Jibi Highles at Martin, and in word, and convenient to the contribution of the cont

There are eleven Exhibitors in this section; of these here are—

Prize Medal for Three Term-cotta Figures, representing

the costumes of Andalusia, MATA ANOTHERA, J. (Spain, No. 289, p. 1347). Ho-purable Mention for an interesting Model of a Bull-

fight, illustrated by 4,000 figures. MONTANABI, N., Upper Charlotte Street, Fitzroy Square (Class XXX., No. 224, pp. 833, 834). Prize Medal for his very beautiful and interesting series of Statuettes illustrating the customs of the Mexicaus.

III. COLLECTIONS OF PRODUCE.

Under this general title there are to be noticed four very important and instructive collections. Two of them consist of the Imports of Raw Materials and Manufactures into Liverpool and Hull respectively; one of the Inorganic and Organic produce of India, and one of Unwrought Materials and Manufactures from the State of Maryland, in the United States. The two most important are those of Liverpool and India, both from their extent and careful arrangement.

UNITED KINGBOM.

1. Mammalia.

The Collection of Imports into the Port of Liverpool (pp. 803-816), exhibited by the Liverpool Local Comttee, contains about five hundred and fifty different substances; but as in most cases several varieties of each kind are exhibited, it comprises a far greater number of specimens than is indicated by this estimate. The na-merous articles included in this collection are arranged systematically under the following heads:-

CLASS A .- ORGANIC SUBSTANCES. Section L. Animal Products.

2. Aves (Birds). 3. Rentilia (Reptiles). 4. Pisces (Fishes). 5. Mollusea. Insecta (Insects), Radiata.

Section II. Vegetable Substances,

Articles produced by Insects, 1. Oils and Balsams. 2. Fruits, Nuts, &c.

 Materia Medica (Medicinal products).
 Vegetable Juices and Vegetable Extracts.
 Dycing Materials. Tauning Materials. 8. Oil Seeds. Agricultural Seeds.

 Dietetie Articles,
 Vegetable fibres. Timber and Hard Woods.
 Miscellaneous (flops and Rusbes). Tobacco.

CLASS B .- INORGANIC SUBSTANCES.

Section I. Metallic, Section II. Non Metallic.

To each article are appended the Commercial and Scientific names, and the name of the Class or Order to which they belong, with the quantity imported into Liver-pool; the locality whence they were exported, and the use of each substance in the Arts are also indicated. A glance at the numerous divisions and subdivisions

just cited will immediately suggest how valuable and interesting such collections would be to the principal seats of British manufacturing industry, especially if they were made so comprehensive as to comprise all raw materials; and not only such as are usually imported, but those also which are known to be useful in the arts, or are likely to prove so, from the quantities in which they can be obtained. These Museums of Raw Produce would, however, be rendered even still more useful by the appointment of energetic curators, fully qualified by previous studies to import accurate scientific and commercial information concerning their contents

It appears from the statement of Mr. Thomas C. Archer. by whom the Liverpool collection was arranged, that the cost of it was about 400/,, which must be regarded as a very small expense in comparison with the importance of the results to be derived from it. Ten months were occupied in making the collection; but it appears that the greater part of each day was consumed in obtaining the necessary funds, in soliciting samples from the producebrokers, and in overcoming the hostile prejudices which existed concerning it. The evenings only were devoted to the classifying and naming the specimens which were obtained by grift or purchase. The time consumed was, it obtained by gift or purchase. The time consumed was, it was stated, one of the principal items of cost, as the Liverpool Local Committee had to reimburse to Mr. Archer his salary from the Government, which be ceased to receive during the ten months he was engaged in making the About 200/, were thus expended; but a large portion of this onthry is attributed to loss of time in soli citing subscriptions; for had sufficient funds been placed at the disposal of the Liverpool Local Committee n the first instance, Mr. Archer conceives that a collection ten times as extensive might have been formed, at a cost but little above that of the present one. This, indeed, was collected under great disadvantages, a few cases being provided as they were required or count or automated. Much credit is due to the Liverpool Local Committee and especially to Mr. Archer, for the perseverance which they evinced in prosecuting their labours under such diffirovided as they were required or could be afforded. eulties, as well as for having produced, notwithstanding, so extensive and valuable an exhibition for so small ar expense. As a detailed list of the specimens comprised in this display is given in the Illustrated Catalogue, pages 803-817, it is unnecessary to reprint it in this Report.

The Collection of Imports into the Port of Hull, exhibited by the Hull Local Committee, is of the same description as that of Liverpool, but far less extensive. This was to be anticipated from the relative commercial importance of the two towns, and from the nature of the trade of Hull, which is chiefly with the Baltic, Flax, Iron, Tallow, Cereal-grains, Linseed, and Linseed-cake, form important items in it. Altogether there are about one hundred and twenty different substances exhihited, to which are appended the commercial and scientific names, and the quantity of each imported into Hall rtailed list of the collection is given at pages 816 and 817 of the Illustrated Catalogue.

The next of the series under review is the Miscellaneous Collection of Mineral, Vegetable, and Animal Substances (pages 860-907), used by the natives of India in their (pages 500—507), used by the natives of isolan in their various Arts and Manufactures, as well as in Medicine. They were principally gathered from the Bazzars of the Bengal Presidency, by Dr. J. Forbes lkoyle, during his residence in India: but they include also some additions obtained by Dr. Falconer, in Cahmere, and by Dr. Stocks, in Scinde

In the arrangement of this collection for the Great Exhibition, Dr. Royle states that he is much indebted to Mrs. Royle for her assistance. It is important, from the vast number of substances contained in it, which amount to between eleven and twelve hundred in number, procured from a few only of the Banares of India. They are need by the analytics of a reside of purposes, but though many possess active properties, others are known a with certainty possess active properties, others are known a with certainty to be some of the must powerful and efficient drugs; and many the contract of a metal properties, though they are lest little account in Europe. It is independently of their moleitant are sufficient forward and pulsars. Surveyinding Sected Michael and Society of its the text is, after instance, the account of the contract
imperfect means.

The collection is further interesting, both in a literary and scientific point of view, because most of the su stances, which are here gathered into a focus, have their properties described in the various works on the Materia properties described in the various In those works a variety of synonymes are given, with the names of the same substances as known in the Hindoo, Persian, and Arabic languages, and very frequently in the Greek also. The universal knowledge of these productions is accounted for by the circumstance that the medical works which are in use by the Mahomedan Hakims in India are translations from the Arabic into Persian, with which has been incorporated information from the writings of the Ilindoos. The Arabs, at the Cont of Harous-al-Rashid, it is well known, made translations from the Greek authors, such as Dioscorides; and hence it will be understood why many of the substances, mentioned in such Persian translations as are now in use in India, have both the Arabic and Greek synonymes assigned to them. By means of this collection we are enabled to examine numerous imens of Asiatic natural productions, which are all labelled with their symonymes; and hence it is frequently possible to ascertain the very substances which both the Arabs and the Greeks have described, and to which they assigned an Eastern origin. Thus the Nardau (Spikenaral) of the Greeks may be shown to be the Intansansi of the Illindoos; and Dr. Fallocare has identified their Castas with the Kost or Kost of the Arabs, a product of the mountains of Colabnere, while in former times found its labelled with their synonymes; and hence it is frequently monainum of Cashanere, which in former tunes found its way to Europe, and at present forms an extensive article way to Europe, and at present forms an extensive article parallels have been traced out by Dr. Reyle, in his Europe on the Astispits of Hinda Dayles Hotang. He has also been the to identify some of the plants mentioned in the sacred writings, from their Arabic synonymes, as he has shown in his paper, The Mandar-tire and the Hyson of Stown in his paper, The Mandar-tire and the Hyson of Scripture.

As a complex list of the swieles contained in this unbandle collection is given in the Historian Conslopes (pages 89-50), it is only to conseque how to that that it could be suffered to the state of the sum of

UNITED STATES OF AMERICA.

The Collection of some of the Products and Manufactures of the State of Maryland (United States, 371, p. 1459), which is contained in an ornamental calinute made of the principal woods of that State, comprises about Eighty different substances. The chief of them are ores, chemi-

cabs, and woods; and the cabinet itself illnstrates the uses to which the woods may be applied. The Jury of Class IV. having also awarded a Medal to this interesting collection, it is to be expected that the various objects exhibited will be discussed in detail in their Report; but as the Hustrated Catalogue does not contain a list of them, the following summary will not be regarded as misplaced:

DRESSING-CASES,-The tasteful and compact arrange-

ment of these most useful receptacles belong to a very modern period, but they have, probably, not every verstatused the high degree of eligant convenience of which they are equable. In their primitive character, lowever, of personal shormsent—even the dressing-case is of considerable antiquity. There is a remarkable allusion to coffers of ivery, probably wrought into the forms of buildings, and containing perfames, in Palm at n. et al. (1998) and the properties of the proper

Are have provide in the deve of limins incorp, and the last of the

With this ancient casket was also discovered another receptacle, of the species which the Romans denominated receptacle, of the species which are sound to it, appeared to be intended for suspension from the arm. vessel formed a box of sixteen sides on the exterior, having a circular cover; and greatly resembled a Serisium for containing manuscript rolls, especially as it was deco-rated on the outside with raised figures of eight of the Muses, interchained with garlands; the remaining Muse being placed on the summit. The capsula measured 1 foot in height, and was about 15 inches broad at the base, Within the case was a flat top or tablet of copper, dividing it into one large central compartment, sur-rounded by four of a smaller size, probably originally intended to receive volumes of books. The contents, however, were boxes, essence-phials, small paters and ewers, several tolette-spoons, a taper-stand in the form of a closed hand, a beautiful little wase covered with ambesque figures, and some ornaments for a litter; all which furniture was of silver. The size, the extent, and the luxury, of these antique dressing cases will, bowever, be considered less remarkable, when it is remembered that the perfumes, the ornaments, the mirrors, and all the toilette-furniture of a female, was called by the Roman jurisconsults "Mundus Muliebris," or a woman's world; and, indeed, they have their parallels in the Great Exhibition.

Chee for combe and mirror, which were usually kept together, were common in England from the latter half of the sixteenth century; when the haberbandward and the sixteenth century; when the haberbandward and the sixteenth century; when the haberbandward and the trees of the metropola, and in the Upper-Pawa or galley of the metropola, and in the Upper-Pawa or galley of the metropola, and in the Upper-Pawa or galley of the metropola, and in the Upper-Pawa or galley of the metropola, and in the Upper-Pawa or galley of the metropola, and in the Upper-Pawa or galley of the metropola of the metropola of the metropola of the metropola of the Upper-Pawa or galley of the Upper-Pawa or galley of the March of

BRITISH COLONIES.

The contributions from the British Colonies are numerous, but they must, in most cases, be regarded rather as curiosities than as articles of large sale. From Ceylon there is only one article, namely, a Desk of Porcupi quills, arranged parallel to one another, and surrounded with a border of carved ivory, the sunken portions being filled with colour. The Indian Court contains numerous specimens of boxes made of a variety of materials, and ornamented with great taste in several different patterns, Amongst these may be enumerated a Desk and Envelope-box of ivory and sandal wood, and a Porenoine-quill box from Calcutta; a beautifully and elaborately carved Cutchbox, and several specimens of boxes from Bombay, ornaented with tasteful and minute inlaying. New South Wales contributes a Desk of polished woods of different kinds. From New Zealand there is a box which may be regarded as a native dressing-case, as it is used by the aborigines to contain their head-dresses. In the South African Section is exhibited an Olive-wood work-box, which has been sent from the GROENELOOF MISSIONARY STATION. And lastly, from Van Diemer's Land, Mr. McNauchten contributes a Writing-desk and a Workbox, made of Musk-wood, and inlaid with pine, blackwood, she-oak, and myrtle.

CRINA

There are Three Exhibition of Writing-desks and Weeks in the Chines Propriettest. Mr. Chazana Corractest in the Chines Propriettest and Chazana Corractest in the Chines of the Chinese State of the Seems and the Seems are collectaing based and Japanese and the Seems of calculating based, and Japanese of Japan desks are she exhibited by Huverra and Co. [14]), not of which is commented with a benquer of Japan desks are she exhibited by Huverra and Co. [14]), and the commented with a benquer of Landscape partiared in relief with gold breast. These process much historical by the puper-model smartineture, that must not be regarded as of the highest class of Japanese and Co. [14]. The control of Chinese who have been must for the landscape in Annality Manufall and Co. [14] and Co. [14]. Legvin, also powers amany of the most transfill extension ples extent, and the Mounton of the Huper also contains a present and Co. [16].

The Egyptian Court contains a Writing-case made of Alizier-wood.

Passer

Although the Exhibitors in the French Department are few, their display, chiefly of Dressing-cases, is most gorgeous and costly, and the articles contributed are remark-able alike for their beauty, brilliancy, and variety. The cabinet-maker of Paris stands unrivalled for the clegant lightness of his designs and the exquisite finish of his workmanship; and the same is true of the French artist in huhl and marqueterie. Hence it will be readily credited that the plain French easkets are unsurpassed, and the more orante mequalled. With regard to the fittings—whilst due praise must be given for the taste displayed in the designs, the spirited euchasing, the execution of the enamel, and the due balance of bright and frosted work, yet at the same time it must be stated that the French silver has not the high degree of finish usual in the fittings of an English dressing-case. This defect is in a great measure to be ascribed to the metal being polished without the workman having recourse to those numerous preparatory manipulations which give evenuess to the surface. Hence the undulations of surface betray how much has been done by the hurnisher and how little by the polisher. The cutlers and glass are also inferior. It must, however, be stated that these dressing-cases are relatively far cheaper than those of the English; and although each silver article is lighter, yet, as there are more fittings and their size larger -for an ewer and a washing dish are usually includedin the aggregate there is a much greater weight of silver given in proportion to the amount paid. This is in some measure due to the almost nominal duty on silver plate in France, which is only 11 fr. per kilogramme (33d. per troy ounce of 480 grains). It contains 50 parts of alloy in 1000, with a toleration of a farther quantity of alloy, not to exceed 11 parts per 1000. The French have not yet sneceeded in the manufacture of Russia and other better classes of leather dressing-cases, and but few examples are to be found in their section; these appertain to the class of goods belonging to Class XVII., the Jury for which has examined them

Iu 1847 there were in Paris One hundred and fifty-eight dressing-case, work-box, and writing-case makers, em-ploying Nine hundred and eighty workpeople (882 men, 30 women, 68 boys), who manufactured goods valued at 155,120f.

PERSTA.

The Persian Court contains examples of inhid and japanned Work-boxes, and also a Pen-case, which are contributed by Mr. Mills, Jun., who states that they were collected by his father during his residence in that country. They may, therefore, be considered as truly representing this description of manufacture in Persia.

His Majesty the Kino of Portugal (1237, p. 1318) contributes an elegant Ebony Writing-case, inlaid with

SAXONY.

One Exhibitor in the Saxon Department, W. Rock-HAUSEN (172, p. 1112), sends several creditable glove-boxes. made of rosewood and sycamore, some inlaid with mother-of-pearl. The prices of these are 42s., 45s., and 6os. per dozen. There is also a lady's dressing-case in his collection, valued at 60s., which, from its simplicity, recalls the remark of Böttiger, after describing the Roman toilet-box before spoken of, when he says, "Our ladies are generally satisfied with boxes of atins (satin) or rosewood, inlaid with hruss or silver, while the ancient fair condescended not below silver materials, and the workmanship of a sculptor."

Swenzy

The Swedish Court contains a Writing-case which calls for no particular comment.

* Statistique de l'Industrie Paris, Part II., p. 821,

UNITED KINGDOM.

The Exhibitors of Dressing-cases and Work-boxes principally, but also of Desks in Classes XXIX. and XVI., are nincteen in number. Besides these, there are Fourteen Exhibitors in Classes XXII., XXVL, XXVIII., and XXX., whose productions did not come under the notice of the Jury of Class XXIX.; and the fact that writing-desks and writing-cases are exhibited chiefly in Class XVII. has been already adverted to. Confining the present remarks, therefore, to the two first-named Classes (XXIX. and XVI.), it may be stated, that the general display of British Dressing-cases, &c., is highly creditable to the numerous Exhibitors. Beside many examples of the more usual kinds of wood dressing-cases, remarkable for their cheapness and excellence, it comprises some examples of a more costly description, which, in comparison with those in the French Department, are, unquestionably, higher in price, even after making all allowances for the lower duty of silver in France. They are, however, exquisitely finished, in all the details of the case and fittings, which are posprpassed for excellence of workmanship. Indeed, the silver-work is far higher in point of finish than the French, a circumstance which has already been commented upon, In Leather Dressing-cases the British have no competitors, either for cheapness or excellence of workmanship; and the numerous examples which are displayed were highly praised by the Foreign Jurors.

It is chiefly within the last twenty years that Leather Dressing-case making has attained its present high state of development; and this is principally to be attributed to the liberal support of the better class of workmanship given by the leading houses in the trade, and to the judi-cious encouragement of the individual efforts of their workmen by a due appreciation of their merits. The im-provements which have taken place within the last ten years in the manufacture of dyed leathers in England, has also had a very beneficial effect on this hranch of muuufactures. The number of Leather-case makers in Great Britain is not large, there being only 468 workmen and 250 females. As the best description of work is produced principally in London, the greatest number of workmen are there employed, amounting to 308, the workwomen being only 20; whilst, in Sheffield, there are no less than 200 females, who are considered to be very skilful, and only 47 workmen, employed, who are chiafly occupied with the more common dressing-cases, and in making the better kinds of razor-cases. In Birmingham, there are 50 workmen and 30 girls, also engaged on articles of a second class. Beside these, there are many workmen employed in making wood dressing-cases and the various fittings; hnt the Reporters have not been able to ascertain their number. It may be remarked, that the glass trays and covers are made principally in London and Birmingham, whilst Sheffiald produces the metal covers, and shares with London in the supply of the cutlery. The hinges, handles, and other metal work, are obtained chiefly from Bir-

mingham One of the largest Exhibitors of Dressing-cases, Workboxes, and Desks, in Class XXIX., is our colleague, Mr. J. J. Mecut (No. 45, p. 791), who is, by his position of Juror, precluded from competing for a recompense. justice, therefore, to the excellence of his productions, the following resolution was proposed to the other Jurors of this class by M. Natalis Rondot, seconded by Viscount Canning, and carried ananimously, on the 23rd of July.

" M. J. J. Mechi a exposé une collection de Nécessaires-detoyage, de Papeteries, de Tables et Coffrets-à-ouerage dons lavaelle en trouve une remarquable diversité de modites et

" Membre du Jury de la Classe XXIX, M. II. PARASOLE AND UMBREAKS.

J. Parasols – The first employment of those portable protections from the sun and rais, called Parasols and Umbreaks, probably commenced with the former of those inventions, in a region where the intensity of the light and heart readered a shade almost indispensible. In the combreak the readers of a shade almost indispensible. In the combreaks of the property of the p

ower. Home it became an inflation of high rash. The record disorteries at Nurset show that the Parson of the Parso

There appear to have been more than one species of num-shade proper to Egypt, as represented in the senjatures and paintings of that country. Of these, one appear feathers, faced upon a long limited, in other cases, the figure scene intended to represent the emopy of a parsod, drawn with the imperfect shill of no be gipt mass rate. So drawn with the imperfect shill of no be gipt mass rate, Se flavors with the imperfect shill of no be gipt mass rate, Se Ethiopana princess, travelling in her chariest through Upper Egypt to Theles, wherein the car is furnished with a knot of unibreds faced on a tall strong srad raing the chairs-amberland of the prevent time, by recentling the chairs-amberland of the prevent time, by recentling

From the very limited regal use of the Parasol in Air and Africa, it seems to hire passed both as a distinction and Africa, it seems to hire passed both as a distinction declining ages of those countries. The Nikadéno, or the high spike of the Countries, and the Parason of the Paraloy-shade of the Greeke, was carried vow the break of African were required to been parasols over the break of the massless of the cay, at the great Seitries of the Parascover the roof of the simplification; if was the existion for cover the roof of the simplification; if was the existion for cover the roof of the simplification; if was the existion for cover the roof of the simplification; if was the existing a cover the roof of the simplification; if was the existing and contributed to the contribute of the contribute of the parason of contributed to the contribute of the contribut

Although the use of the Parasol was thus early introduced into Italy, and had probably been continued there as a vestige of ancient Roman manners, yet so late as 1608, Thomas Coryat notices the inventiou in such terms as indicate that it was not commonly known in his own country. After describing the fans of the Italians, he country. After describing the fans of the Italians, he adds, "Many of them do carry other fine things of a far greater price, that will cost at least a ducat (5s. 6d.), which they commonly call in the Italian tongue Umbrellace, that is, things that minister shadow unto them for shelter against the scorehing heat of the sun. These are made of leather, something answerable to the form of a little canopy, and hooped in the inside with divers little wooden hoops that extend the unbrella in a pretty large compass. They are used especially by horsemen, who earry them in their hands when they ride, fastening the end of the handle against one of their thighs; and they impart so long a shadow unto them, that it keepeth the It is probable that a similar contrivance existed at the

It is probable that a similar conditriance existed at the total role of the condition of th

But the use of such a defence against the heat was not nuknown in Eagland, though probably only used as a luxury, even in the early part of the seventeenth century. Hen Joosson mentions it by name in a comedy produced

in 1616; and in 1640 it occurs in Beaumont and Fleteber's "Rule a Wife and have a Wife," when Althen says.—

"Are you at ease? Now is your heart at rest? Now you have got a shadow, an Umbrella, To keep the scorehing world's opinion From your fair credit."—

As a canopy of state, the use of the Umbrella mpecars to have been general in Southern Europe from a very time (herrel); it was borne over the Bost in precessors; it formed part of the possible regals; and about a.b., 1175, when Pope Alexander III. took refuge in Schautian Zain, the Deeg, and his successors, the privilege of placing the Possibleal parasol over their armortal Without, however, attempting to trace any further the

frequent appearance of the parasol in the early history of Europe, we may be allowed to make a few statements regarding the Parasol of the Chinese. According to the statement of Dr. Morrison, Parasols and Umbrellas in the Celestial Empire appear to be first referred to in books printed about A.D. 300; the tradition being, that the San, which signifies to cover or shade off the sun and rain, originated " in standards and bunners waving loose in the This date, however, has been recently proved to be many centuries too modern, by the evidence of a very eurious book of Chinese ceremonies, entitled Tcheou-Li, or the Rites of Tcheon, for the first time translated and published by the late M. Biot. † The author of the work was Prince Teheon-Kong, brother of Won-Wong, the first Emperor of the Teheou dynasty, who wrote it at the begin-ning of the twelfth century before the Christian era. In this valuable work is contained a descriptive detail of the duties of the several officers belonging at the period to the Chinese Court; and it directs that the workmen making the wheels of the Imperial earringes should also place the the age where the cars. The figure of this dais | contained in the Chinese edition of the Tchees-Li, and the particular description of it given in the explanatory commentary of Lin-hi-ye, both identify it with an nmbrella. The latter describes the dais to be composed of 28 arcs, which are equivalent to the whalebone ribs of the modern instrument, and the staff supporting the covering to consist of two parts, the apper being a rod 3-10ths of a Chinese foot

\$ Ibid., p. 478.

any defence, excepting from the rain, could never be required in the streets of London. The verses in question are suggestive of two very curious observa-tions connected with the listory of the articles under consideration. From the beginning of the present century, the use of the parssol as a protection against the sun has been increasing in Londond until it has become aniversal amongst females, contrary to the declaration of the concluding lines. The Umbrella, on the contrary, though apparently well known in Gay's time, did not come into general use until the close of the last century. Jonas Hanway is stated to have been one of the first men who commonly carried one, for it was usually regarded as proper to females only; and he, probably, brought the practice from Persia or from the continent. In the Statis-tical Account of Glaugow, hy Dr. Cleland, it is related that about the year 1781 or 1782, the late Mr. John Jamieson, surgeon, brought with him an Umbrella on his return from Paris, which was the first seen in the city, and attracted universal attention. The earliest specimens of the English Umbrella were made of oiled-silk, which, when wet, were exceedingly difficult to open or to close the stick and furniture were heavy and inconvenient, and the article generally very expensive.† Its transition to the present convenient portable form is due parily to the substitution of silk and gingham for the heavy and troublesome oiled-silk, which admit of the ribs and stretchers being made much lighter; and also to the many ingenious mechanical improvements in the frame-work which have been made from time to time, chiefly by English and French manufacturers, several of which have been pa-tented. No change has proved a greater convenience than that from the old-fashioned ring and string, for securing the Umbrella when closed, to the clip and Indian-rubber braid; and yet, before this was accomplished, many tran-sitions had to be passed through, which must be familiar to most persons: these outward improvements may be taken as the type of numberless others which are not ap-

preciated, because they are not generally seen and understood.

We may now pass to the consideration of the various contributions from the different countries, first, however, premising that from England and France the largest quantities have been received.

Acceptata

The Parasols and Umbrellas of Austria are gandy, and not very well finished, and, indeed, evince but little skill or taste on the part of her two manufacturers who exhibit the finished articles.

The contributions from Belgium consist of Parasols only, and were sent chiefly by one Exhibitor; for although purasols covered with rich lace are exhibitor; for although east gallery with other articles of lace, they cannot be regarded as appertaining to this branch of trade. The Parasols exhibited (No. 432) are well manofac-

The Parasols exhibited (No. 432) are well manufactured, but are not in such good taste as those made in France; whilst at the same time they are dearer than similar goods sent by the English makers. The prices quoted vary from 20s, to 25s, each for plain parasols, covered and lined with silk.

BRITISH COLONIES.

The richer contributions from the East Indies and the Island of Ceylon consist of State Parasols or Umbrellus. many splendid examples of which adorn the Indian Courts. The most remarkable example is the gorgeous Statenmbrella from Moorshedabus, exhibited by His Highness the Maharajah of Nanroos. This beautiful object is represented in the Hinstrated Catalogue, p. 924. ribs and stretchers, which are gilt, are sixteen in number and divide the umbrella into as many segments, covered with silk exquisitely embroidered with gold and silver ornaments; the upper part of the design is complete in each compartment, but at the lower it is formed into a graceful running border, to which a fringe is fastened. The handle is hollow, and in formed of thick silver plates, Other examples contributed by his HIGHNESS THE RAJAH OF DROLEPORE (p. 924) comprise the Sorroej Mackre, or native parasol, covered with rich damask silk, and having likewise a silver handle; and the gold umbrella with silver top and handle, and enriched with gold fringe. Of the more usual descriptions may be cited several specimens of Bengalee Chattake or small umbrellas, conical manifold plaits, and consensently ribs and in form, with stretchers. These chattabs are composed of the leaves of Licaula pelluta, and are the description used by the poorer classes of natives of Bengal during the rainy season. Of the same class is an unlirella made in Gowhattee, of the same material, but used by the higher classes of natives in Assam. There is also a conical umbrella of painted and variabled cloth, made in Calcutta; and, as if to illustrate how difficult it is for the native taste to adapt itself to European requirements, there is a very inferior imitation of an English umbrello, having ten ribs, covered with crimson calico, and lined and fringed with dark green.
This umbrella, it appears, is generally used by Europeans throughout India,

CHINA.

In China the Coulerthis is still a mark of high reads, but and can chancely on it must not be, overer, in inferred land conclusions, and in the control of t

 In Alexander's Costone of China, Part 8, is a plate representing a group of Chinose, habited for rainy weather, which accords with this description. entitled "Umbrellas in the East," are evidence that the umbrells is not an article of such paramount importance in Chins as in England; and yet Umbrellas and Parasols are made in considerable numbers in the provinces of Kwang-tung, Fo-kien, and Hoo-kwang, and form an important branch of commerce. They are exported from Canton, Amoy, and Shanghae, to India, the Indian Archipelago, and even to South America; in 1846, 300,000 were sent out from these ports. Almost all the parasols and umbrellas are covered with oiled paper, which is afterwards painted and varnished. At Canton umbrellas are termed Kittysols, from the Spanish word quitasol; the Chinese name is Chi-yn-son, or Yn-che. Two examples only are exhibited in the Chinese Court; they are contributed by Messrs, Hewett and Co., but present nothing remarkable beyond the great number of ribs, which amount to fortytwo. These ribs are formed of wood; and instead of being embraced by the fork of the stretcher, as is the case in European umbrellas, they have a groove cut in the middle of their length, into which the stretcher is secured by a stud of wood. The head of each rib fits into a notch formed in the ring of wood, which is fastened on to the top of the stick, there being a separate notch for each rib. The slider is of wood, and has forty-two notches, namely, one for each stretcher, which, like the ribs, is formed of wood. The covering of the umbrellas exhibited is of oiled paper coarsely painted.

FRANCE. In the higher class of Umbrellas and Parasols, France undoubtedly stands pre-eminent. The tasteful designs and sharp and excellent carving of the ivory handles, and the artistic grouping of the colours of the various silks used in the manufacture of parasols, and the supple dress-ing of the silks for umbrellas, give to the French manu-factures a decided superiority; added to which, the frames were much lighter and nenter than those made in England until a very recent period. The French parasols and umbrellas have, in consequence of their lightness and elegance, acquired a high reputation in America and Italy, to which countries large quantities are annually exported, as well as to the French colonies. Taking an average of the annual exports of Silk Umbrellas and Parasols from 1827 to 1836 inclusive, their value was 36,360L; between 1837 and 1846 it was 54,1721.; and in 1847 it had reached to 70,0881.; so that in twenty years the exports had nearly doubled in value. To obtain, however, the true exponent of the annual exports in umbrellas, must be added the average value of the uncovered frames exported in the same years; in the first-named period it was 7,160L; in the second, 9,160L; and in 1847, 9,280L: so that the value of the umbrellas, parasols, and frames which were ex-ported in that year was 79,368l. Whilst the foreign trade of France has been rapidly increasing as regards silk on brellas, she has lost ground in those covered with gingham, io which her trade was bever large, owing to the competition of the English makers. Thus, from 1827 to 1836 the mean annual value of the exports was 1,2401,1 from 1837 to 1846 it was 960l.; and in 1847 it was reduced to 480l. According to the Statistique de l'Industrie è Paris, Part II., p. 825, etc., it appears that in 1847 à Paris, Part II., p. 825, etc., il appears that in 1847 there were in Paris 377 materies engaged in the business of umbrella and parasol making, and comploying [4,429 work-people (501 mex, 742 women, 43 boys, 31 girls); who, according to M. Natalis Roadot's estimate produced goods to the amount of 205,222(ii. in that year; not much unore than one-fourth part of which was exported, as will be seen by comparing the furgregoing figures. In 1850 the exports were somewhat less than in 1847; thus the value of the silk umbrellas and parasols was 57,3864., of gingham umbrellas 891., of umbrella and parasol-frames 9,0951., making a total of 66,5641. Besides the umbrella mounters and finishers, there were

in 1847 in Paris 74 manufacturers, employing 304 workpeople (264 men, 6 women, 34 boys) engaged in the production of sticks, handles, and tips, whose returns were 30,400l. Of the 377 parasol and umbrella mounters and finishers-

Parasols and Umbrellas were formerly made by the rporate body of " Boursiers" (leather purse makers), who were at the same time breeches makers, cap makers, collar-makers, brace-makers, powder-puff, game-bag, and travelling-bag makers. In 1754, says M. Natalis Kondot, there were 250 master purse-makers in Paris; and quoting the Journal du Citogen of that date, he remarks, that the folding parasol sold at from 12s, to 17s, 6d, each, and the common parasol from 7s. 3d. to 11s. 3d. ench. Two questions naturally suggest themselves, what was the form of these instruments, and what their weight; fortunately both questions can be answered satisfactorily. In the well-known French Encyclopædias* there are plates representing the whole of the objects made by the " Boursiers. and the tools employed in their manufacture. The usual parasol or umbrella of that period which is there figured, closely resembles the ordinary gig-unbrella of the present day, and, slightly modified in form, is still used by the peasantry of France. The folding parasol was constructed with jointed ribs so as to fold back, and was likewise self-opening. The rod was a metallic tube, and contained a spiral spring which acted upon and pressed upwards an inner rod. To this inner rod were jointed the stretchers, which in this construction were placed above the ribs instead of below, as in the ordinary form; beside which they were much shorter so as to admit of their being concealed by the covering. By the elasticity of the spiral spring contained in the bollow stem, the inner rod was pressed outwards and lifted the stretchers, and by their means raised the ribs also, so that in its ordinary or natural state the umbrella was always open, and would continue so unless constrained to remain closed by a catch. On releasing the catch it consequently sprang open. In order that it might be easily closed, four cords were attacked to four of the ribs and passed to the handle; and a loop embracing these cords passed down by the side of the handle, and enabled the possessor to close his umbretla without difficulty. From the authority already quoted we learn that whalebone was employed for the ribs, and that their number varied with their length: for example, when 24 inches long, the number employed was 8; when 25 inches, 9; and when 26, 28, and 30 inches, 10 were used. Calico was employed to cover umbrellas and silk to cover parasols. The use of parasols was common in Lyons at that period (1786); they were carried by men as well as womeo; "they were rose-coloured, white, and of other colours, and were so light as to be carried without inconvenience," In Vol. V. of the Dictionagire des Arts et Mellers, published in 1788, and forming part of the et Metiers, published in 1788, and forming part of the Encyclopetite Methodique, mention is made of parasols contained in walking-sticks, which fly out by the action of a suring as soon as a catch is released. The comparof a spring as soon as a catch is released. The compara-tive "lightness" of Parasols may be judged of by the annexed statement, which relates to unibrellas of different periods, from 1645 to 1849, contributed to the last French Exposition in the latter year by M. Parge-

Hence it appears that the Umbrella of the present day weighs only one-seventh of that of a century ago. From 1808 to 1848, a period of 40 years, there were 80 Patents of invention, 3 of importation, and 41 for improvements relating to the Umbrella-trade taken out in France. Some of these are for mechanical contrivances allied to those before described; some are for improvements in the ordi-nary frames, and others for the adaptation of machinery as a substitute for hand-labour. With all this, the productions of France must be characterised as high in pr the ordinary wholesale price of a good silk nmhrella of the self-opening construction ranges from 20s, to 40s,, and seri-opening construction ranges from 204, to 405, and that of parasols from 13s. to 80s.; but then they are in every respect exquisitely finished. The French manu-facturer is also famous for many ingenious contrivances: for example, with respect to Travelling-umbrellas, which may be removed from the stick and pocked in a port-mantean or placed in the pocket; and others too numerous to mention in detail.

PORTUGAL.

The Umbrellas in the Portuguese Department, Nos. 1127 to 1143, and the Parasols, Nos. 1144 to 1150, comprising about 30 varieties, are contributed by one Exhibitor, and may be characterised as creditable, though not remarkable, productions. The umbrellas are both with whalebone and steel ribs, covered with black silk, and have ivery and wood hardles. The parasots are also made with metal frames, some for ladies', others for children's use, and are covered with plain and striped silks,

Person.

The contributions from Prussia are from only one Exhibitor, and consist merely of Umbrella and Parasol haudles, which are sold at low prices. In 1846, Prussia possessed Seventy-seven manufactories of umbrellas and parasols, which gave employment to Five hundred work-

Tuxta

The Tunisian Court contains many examples of Parasols, some of which are made of leather and silk, and others of silk adorned with ostrich feathers.

TURKEY.

Although we have not to cite any examples of umbrellas Although we have not to cite any examples of unbivilias or parasols as having been sent, yet, in trating of these articles, it is desirable to allade to the very prevalent couployment of these useful shifters by the middle-classes of Turkey as a remarkable instance of the introduction of European eustoms into that country. So much, however, still remains of the regal attributes of the umbrella, that, in passing before the palace of the Sultan, the custom is to lower it; a compliment which the sentinel on duty does not fail to enforce from the foreigner, who, unconscious of the forms of society, may happen to pass with his umbrella elevated.*

UNITED KINGDOM.

Whilst France stands pre-eminent for articles of the highest class, England is without a rival in the production of parasols and unshrellas of the plainer descriptions. This is to be attributed not so much to the introduction of new the production of the productio and expensive machinery (for it is still almost as simple as that figured a hundred years since in the French Encyclosedins before mentioned), as to the judicious subdi-vision of labour, and the importation free of duty of her colonial cames for the ribs and sticks; likewise whalebone for ribs, and lastly, olso free, born and ivory for the hams and plain silks, also, gives her decided advantages over other untions.

It is not possible to determine with certainty the exact yearly produce in the parasol and umbrella trade, which, for finished goods, is chiefly centred in London; but some idea may be formed of its importance when it is stated that several of the large city bouses dispose of from 250 to 500 dozens of parasols and umbrellas weekly, prices of the commoner kinds is marvellously low, as will be understood when it is stated that children's gingham parasols are sold wholesale from 4d, each, and women's from 10 jd, each. Silk parasols commence at 10 jd, each, and gingkam umbrellas at 7d, and 10d, each, according to the size. Alpaca umbrellas range from 6s, to 12s, each, and silk nmbrellas from 3s, 6d, to 22s, each. To the price of the silk parasol there is scarcely an assignable limit, as any amount of expensive lace may be used to adorn it; the highest price quoted was 51. 5s., but the example was far less elegant than most of the specimens in the French Department, and much higher in price. Our umbrella-manufacturers would, indeed, du well to profit by the example of their French brethren, by calling artistic taleat to their aid in devising new models. For there are many English artists who are capable of furnishing excellent designs for the ivory carver, and of superintending the carving of the first model; with whose aid we should gradually find good engraring taking the place of its present substitute high-polish, whilst the cost on each individual article would be very slightly increased. A little artistic help is likewise desirable in the assortment of barmonious tints; and, at the next Exhibition, there will be no examples of crimson parasols with yellow fringes.

We are indebted for the eleganess of the commoner

umbrellas to three causes :-

To the small cost of labour attributable to the dexterity and industrious habits of the artisan; to the low price of giogham, which is sold at less than 3d, per yard; and to the employment of split and dyed ratan canes for the ribs in lien of whalebone. M. Meyers (XXIX., No. 140, p. 797), reports that bis weekly sales of cane ribs average 12,000 sets, eight to the set; the wholesale price of which is 10d, per dozen sets, or a little more than three farthings for each nmbrella. Although ratan-canes are used for some other purposes, the statement of the quantity imported into the United Kingdom, during the last ten years, will not be deemed out of place in the present Report.

RATAN CANES (not Ground-raten).

Years.	Number imported.	for home consumption,

It has been previously stated, that one element of chesp production is the low price paid for labour. This position we now proceed to illustrate, first remarking that the putting-together of umbrella and parasol frames with caue 2 U 2

^{*} Penny Magazine, vol. iv., p. 480.

and whalebone ribs, is chiefly done by small masters in London, who employ lads to assist them; that the covering is performed by women and girls at their homes; and that in the lowest priced goods, the joint labour of an entire family is necessary to eke out a subsistence, The fixing of the handles and ferrules is often done at the ware-

In order that the reader may better appreciate the small amount of the wages paid for putting the frames together, the subjoined description of the various processes is g The frame-maker requires a capital of from 3l. to el., in order that he may erect a couple of very primitive-looking lathes with a circular saw; a rose-cutter for forming the tips, and several drills, all of which screw into the mandril of the lathes; also a paring-knife, a small vice, and three or four pairs of pliers; and lastly, n" weighing-board." The circular saw, rose-cutter, and paring-knife are comparatively modern improvements. He must rent a room or shop, and pay for fuel and candles. He has likewise to provide all the iron-wire and brass-plate out of what he receives in wages; but the stick, ribs, stretchers, and runners are furnished to him. In order to work ecmically he must employ two lads, but he usually finds it more to his interest to employ four, to whom he pays 4s. per week.

Preparing the Stick. The stick, which is usually of stained beech, is first sawn off to a length; one end is tapered with the paring-knife, to prepare it for receiving the ferrule; two grooves are cut in with the circular-saw in the direction of the length of the stick, in order to receive the two springs, one for sustaining the umbrella open, and the other for keeping it closed. The springs are then made out of iron wire, and fastened one in each groove, the fastening being effected by simply driving one end of the spring into the lundle: the other is left free, but is prevented from fiving out by means of n cross wire, the insertion of which requires two operations, viz., wife, the inferious of water requires two operations, via., drilling a hole and inserting and rivetting the wire. A stopper is formed by bending a piece of wire like a staple, and it is then inserted into two holes drilled above the top spring, in order to prevent the slider from going too far; lastly, two holes are drilled near the top of the stick, through these the cross wire is inserted, and when finished it presents the appearance of a double staple, one loop being on one side of the stick and one on the other. In preparing the stick it has passed at least sinetees times through the hand

2. Preparing the Ribs. Each rib is roughly tapered with the paring-knife at one end, and is rendered smooth and conical by bolding it in the direction of its length in the groove of a wheel lined with fish-skin, which wheel is made to revolve rapidly in the lathe; the taper end of the rib is then held across a steel fly-cutter or "machine, likewise running in the lathe, which cutter has a circular groove of the proper radius of eurvature formed on its periphery. By rotating the rib in the hand its "tip rendered spherical; the tip is then varnished, and has a hole drilled in it, to admit of fastening on the covering and each rib is cut to the proper length by sawing off the opposite end: the "head" of the rib is lapped with thin brass-plate and rounded, and is then drilled, to admit of the "head-wire," on which it is afterwards hinged; the rih is also inpped near its centre with brass-plate, and drilled, in order to admit of fastening on the stretcher; and, lastly, the stretcher is attached by means of an axis of wire, the ends of which are riveted. Each rib passes not less than thirtees times through the hand; and, as there are eight ribs, the frame consequently passes one handred and four times through the hand in this stage of the con-

3. "Weighing" the Ribs. Unless every rib be of equal strength, the nubrella will not "set round," hence the necessity for the "weighing" process. This operation is somewhat analogous to that which cagineers employ in somewhat antalogous to that where cagnifeers employ in ascertaining the deflection of a beam, and is effected by n very simple instrument. The weighing-board is about 3 feet 6 inches long and 2 feet deep, and is affixed to a wall, the longer side being parallel to the horizon; and there are in different parts of it in multitude of shall holes for the reception of wire pegs. The rib to be weighed is is as follows:-

placed over one peg close to its stretcher, and under mouther peg, so far distant from the first as to reach scarly to the hend of the rib; a small leaden weight is then hung on to the tip, and of course deflects the rih; the amount of the deflection (indicated by graduations on the are of a circle affixed to the board) gives the relative strength of the ribs, which are assorted out in sets accordingly. The weighing adds eight more operations to those

already enumerated, 4. "Threadling" the Ribs. Each stretcher, which it will be remembered is attached to the rib, is taken up in turn and threaded on to a wire, and is then inserted, each one in its respective place, in the notches of the slider, and all are made secure by binding the wire round the top of the slider, which is grooved for that purpose. The head-wire is now inserted through four of the ribs, and is then passed through the two loops of the " cross wire at the top of the stick; and now the four remaining ribs are threaded, and the head-wire seemed by twisting its ends together with pliers. Reckoning that this adds four operations, the frame will have passed one hundred and thirty-five times through the bands of the workman or

as assistants. All this labour is performed for $\frac{1}{2}d$, to $\frac{1}{3}d$. In the case of parasols, and for $\frac{1}{2}d$, to 1d, in that of umbrellas, A workman can, nevertheless, earn fair wages at these prices, provided he is supplied regularly with work; but he is frequently subjected to much loss by being kept waiting about in the wholesale warehouses, which some times occasious a loss of at least half a day to him. The prices just quoted are those paid for the lowest description of work, but for putting together the frame of an nu-brella with whalebone-rils the workman gets 23d. Of the cheaper kinds of umbrellas, say those at is, per dozen, a workman and four lads can make four gross per week, for which he receives 48s. After deducting the wages of his lads, 16s, and the cost of the materials he supplies,

nis inds, 162, and the cost of the innermise or suppose, which is about 8a, it leaves him 24s, for himself.

Covering of Umbrellus. This is paid for according to the description of work, the commonest at the rate of

the description of wax, or communication is per dozen, and the best 4s, per dozen.

The frames, which are made of metal, are almost exclusively manufactured in Birmingham. The stick, ribs, stretchers, and ferrule, are all metallie, and require, after many the insertion of a lone word on item. covering, merely the insertion of a long wood or ivery handle and the ferrule to complete the umbrella. These frames can be farnished at from 7d. to 10d. each, and although not so cheap as the canc-frames, they are cousumed and exported in enormous quantities, in consequence of the small bulk which they occupy. Many improvements have of late years been made, not only in the machinery used for making the metallic frames, but also in the construction of the frame itself. Amongst those most deserving of notice, may be cited the improvements of Mr. Holland (No. 131, p. 797) and Mr. Boss (No. 146, p. 798). Either of their constructions adds about 2s. to the price of an umbrella. In conclusion, it may be stated that the umbrella-manufacture in the United Kingdom is in a very prosperous condition, and is rapidly increasing.

WURTEMBURG.

There are Four Exhibitors of Umbrella-handles from this country, the curving on some of which is very hamorous: the most important collection has been reworded for other ivory goods which were exhibited at the same time, and which formed the largest proportion of the contribution. (See Toys).

The number of Exhibitors of Parasols and Umbrellas.

or their components, such as handles, sticks, and mounted frames, is Thirty-three; of these, there are-

> 5 Holders of a Prize Medal 2 Who obtained Honourable Mention. 26 Unrewarded.

LIST OF AWARDS.

Box, Isaac Amanana, 6 Bury Surest (Clear XXIX, No. 146, p. 780; Unknownfab Mentakon is accorded to this Exhibitor for several Mechanical Improvements in the construction of mineflux and parasal frames. One are constructed on of mineflux and parasal frames. One are constructed on the construction of the co

22. 3d., one of ordinary construction being 10d.
Cazat, —, (France, No. 108, p. 1176). Prize Medal.
For Parasols and Umbrellas elegant in form and of excelleat workmanship. The carved ivory handles evince much taste and are well sculptured; the framing, which is very light, in many cases presents novelties of construction. The self-opening umbrella, for instance, may be cited as a very ingenious contrivance; the desired effect being produced by simply making each stretcher double, and so arranging the parts that a tension is put on one of the sets of stretchers in closing the umbrells, which consequently flies open as soon as a cutch is released. A travelling umbrella, so arranged that the stick may be conveniently removed and used as a walking-stick, is also worthy of commendation. The prices of the nubrellas are, however, high; they range between 32s. and 100s. each. M. Cazal likewise exhibits Canes made of rhinocacit. M. CAZZI Inkewise exhibits Cance made of Finion-ceros-horn, white whale-loose, and conglomerated hera... Charactear, E., Paris (France, No. 1144, p. 1233). Prize Medial. For Unbriellas and Parasols of first-rate workmanship. The designs and sculpturing of the handles are in all cases of the highest class. The case of this exhibitor likewise contains numerous examples of ingenious mechanical contrivances, among which especislly to be commended is an umbrella which closes of itself when a spring near the handle is touched. The specimens, although equal in manufacture, and, at the same time, more moderate in price than those last mentinned, must still be considered as costly; nmbrellas, for instance, range from 20s. to 60s., and purusols from 13s, (very plain) up to 80s, for the more elegant class, whole-

table.

IBOLARON, Hewart, Birmingham (Class XXIX, No. 131, p. 192). Price Nedal. able Meuriou, This Exhibitor contributes a great variety of Parasol and Unabrella Handles, manufactured from horn, hone, and ivory, which are deserving of Honourable Meution.

III. WALEING-STICES. When succer the heroic period may be supposed to have

Wheredever the herete period may be supposed to have was the well known, since it is referred to in the engines put forth by the 'sphysta, and solved by Gdijass. "There a Being," said the questioner, "which has fore in the part of the the property of the

totters with a sizes.

The use of a staff for support in walking appears to be so natural and inartificial us not to require any illustration; and yet the Pilerim's staff of the middle ages. and the Alpensick of the present time, have a certain amount of historical interest. The Bourdon, or Pilgrin's staff, was a strong and stout stick, apparently about five feet in length, armed at the lower end with an iron spike, and intended to supply a support and balance to the body, when the traveller was climbing up slippery paths or steep acelivities. About a foot from the top of the staff was generally found a large protuberance, rither artificially or naturally formed around the staff, on which the pilgrim's hand securely rested, without danger of sliding downwards. The lower part of the staff was altogether solid, but the apper joint was a hollow tube, capable of containing small articles, like a long circular box. It is probable that these articles were originally reliques of saints, or the "signs," as those emblematical figures were usually termed, which were commonly sold at the shrines to which pilgrims travelled, as proofs that they had really visited those sacred spots. In the later ages of pilgrimage, however, this part of the staff was sometimes converted into some kind of pipe or musicalinstrument, such as sticks have frequently contained in modern times. Above the tabe the staff was surmounted hy a small hollow globe, and it was also furnished near the top, on the outside, with a kind of crook, for the purpose of safely sastaining a goard-bottle of water. After the pilgrim had completed his votive journey, and returned from Palestine, he commonly brought with him a branch of palm, fastened into the top of his staff, as the proof of his travel into Palestine or Egypt. It is, how-ever, unquestionable that the pilgrims' staffs frequently became the receptacle of secular articles. It is recorded by Holinshed, that in the hollow part of a pilgrim's staff the first head of saffron, afterwards so successfully culti-vated at Saffron-Walden, was secretly brought over from Greece, at a period when it was death to take the living plant out of the country. The silk-worm also found its way to Europe in the hollow of a pilgrim's staff. So late way to Entrope in the nonew of a pigerin's analos as the time of Cervantes, certain Spanish pilgrims existed, who had collected newards of a hundred crowns in alms, which, being changed into gold, they concealed in the hollow of their staves, or the patches of their clothing. It seems to be a natural observation in this place, that the aucient contrivance of making a repository in the hollow of a walking-stick is not yet obsolete. In the Great Exhibition, Dr. Gnay, of Perth, displayed a medical walking-stsff, containing a variety of instruments and medicines; and the same principle has been also frescopes, instantaneous-light-apparatus, and many other

important arricles.

Several varieties of sticks were likewise exhibited enchosing in them words, dirks, and apring-spectre. The besings that we words, dirks, and apring-spectre. The besings that they required a heavy blow to be given with the armed end before the strong spring could be overcome which held back the spectrodes. Severhielder, Severhielder, but this kind of weapon walking-straves is not of later invention than the last century; though that which colearly VIII.

The Algentock is another ordinary travelling-staff requiring to be noticed, of modern me, though of great antiquity. It is a stout pole of about six feet in length, provided with an iron spike at the lower cud, and surmonoted with a chamois' horn as an ornancia. It is almost indispensable in mountain journeys, and may be

procured for two francs throughout Switzerland, Another order of walking-sticks comprises those light wands to which the name is now exclusively attributed; and these also are descended from a time of considerable antiquity. The stem of the giant-fennel the Ferula of Pliny, is the chief progenitor of this family, and he derives the origin of the name of the plant either from fero, from the stalk being employed in walking, or from ferio, because schoolmasters used it for striking boys on the hand. It would seem as if the latter interpretation had become established at an early period, since Martial terms the ferula aceptrum pedagogorum; and even down to the present day the word popularly conveys no other meaning. The tough lightness of the fennel-wood rendered it especially fitted for a support to aged persons; whilst the imposing length of the staff gave as air of importance to those who carried it. Hence it became the prototype of those lighter wands, which have continued as the sign of seniority or gentility to the present

In Orderal countries the substitute for the fermit was for fively right as a specific and the six methods of story light as a support, and the six methods of Gregs, is noticed, in probable a provertied form, by the Gregs, is noticed, in probable a provertied form, by the Gregs, in the Gregorian control of Gregorian control

In the Egyptius sculptures persons of importance or offsicial rank are represented valking with tall sleader staves, having the lotas-lower on the top. Several many control of the contro

At a very early period of the Soreed history the disintertive character of the staff carried by an individual is indicated from his immediate recognition simply by the production of it with his signet and his barwelets (Gensis xxxviii, 18—29). Homer has commemorated the "sceptre-bearing princes" of the Greeks, and especially the sceptre-staff of Achilles, adorned with golden studis; "I will swear a great each," mys the here, "even by this

reeptre, which shall never again bear leaves or shoots, nor will bed again from the time it left its trunk upon the mountains, when the axe stripped it of all its leaves and bark." These sceptres, although they were indiputably the insignia of rank and authority, were also evidently the usual walking-sticks of persons of the highest class. Agamenoom, it is stated, never went forth without

bearing with him his paternal stell of royalty.

as well as Gay's commemoration of the same kind of walking-stick in " The Van :"—

44 Here clouded canes, 'midst heaps of toys are found, And iolaid tweezer-cases strew the ground."

The most carious account of the walking-sticks of this period is, however, contained in the "Tatler," No. 103, written by Addison and Steele, and published on Tuesday, 6th December, 1709. In that paper Isane Bickerstaff represents himself as issning licenses and regulations " caues, for the beaux of the time, as to the carrying of for the beaux or the time, as to the carrying or caucs, perspective glasses, orange-flower waters, and the like ornaments of life." The first part of the essay is in-tended to ridicule and abolish the prevailing absurd though fashionable practices connected with walkingsticks; hence the respective parties were licensed to carry them provided they did not walk with them under the arm, nor brandish them in the air, nor lung them on a hutton. One of the petitioners desires permission to renutton. One of the pertubures useres persuased to ter-tain bis cane, because it had become as indispensable to him "as any other of his bimbs," and because "the knock-ing of it upon his shoe, leasing one leg upon it, or whistling upon it with his mouth, are such great reliefs to him in conversation, that he does not know how he should be good company without it." The cane of this person being produced, it is described to be "very cu-riously clouded, with a transparent amber-head, and a blue riband to hang it ou his wrist."

In the second half of the last century there was one peculiar form of walking-stick prevailing, which was generally used by females who were advanced in life. The

^{*} Costume in England, by F. W. Fairbolt, p. 473.

sticks referred to were between five and six feet in height. taper, and slender in substance, turned over at the upper end in the manner of a shepherd's crook, and twisted thoughout the whole extent of the wand. The materials were either wood, ivory, or whalebone, mounted with silver or gold, and sometimes they were formed entirely of a clear, pale, green glass. The length of the most fashionable sticks of this period is noticed in a number of The Loudon Chronicle published in 1762, wherein the writer says, " Do not some of us strut about with walking-sticks as long as hickory poles, or else with a yard of varuished cane scraped taper, and bound at one end with waxed thread, and the other tipped with a neat ivery head as hig as a silver penny." Towards the close of Towards the close of the eighteeuth century two peculiar forms of walkingsticks were commonly carried by the most gay of the voung men of the period, one being a very short and strong bamboo-cane, bent over at the top, and the other a stout knotted stick, in which the grotesque natural growth of the wood was frequently regarded as its greatest excellence.

Auother kind of walking-sticks comprises those gro-tesone stayes which have been devised or adopted by individual fancy or eccentricity. It is possible that this peculiar humour may be of considerable antiquity, since the knotted walking-staff and wallet were the distinctive attributes of the Greek and Roman philosophers, and especially of the cynics. The chief peculiarity of this class of staves, however, consists in an ingenious adaptation of the excrescences of the wood of which they were made into grotesque human heads and faces, of which the Exhibition contained many eurious and remarkable in-stances. The old English form of these staves may per-haps be referred to the bunbles earried by the fools and lesters who were retained by sovereigns and noblemen of the sixteenth and seventeenth centuries. The Jester's Bunble consisted of a short stout staff surmounted by the earved figure of a puppet or a fool's head; and the modern practice of carrying sticks decorated with humorous faces appears to have existed early in the eighteenth century. About 1730 The Universal Speciator states, that at the court end of the town, instead of swords, many polite young gentlemen " carry large oak sticks, with great heads and ugly faces carved thereon. Perhaps some of the most remarkable instances of these carved some of the most remarkable instances of these carried sticks ever exhibited were those executed and carried about by James Robertson of Kineraigie, otherwise called "the daft Highband laird," of whom Kay published an etching in 1784. In the latter part of his life he adopted the amusement of carring, for which he had some talent, and sculptured in wood the efficies of such persons as attracted his wayward imagination, whether friends or enemies: the latter, however, being executed in caricature. These small figures be mounted on the upper end of a walking-stick, sometimes one above another; and as it was reported that he produced a new one every day, he was commonly accosted with the inquiry, "What has ye up the day, laird?" to which he would readily auswer, by naming the individual and the reason for selecting him.*

bark. The West Indies furnish a copious supply of the most approved materials for walking-sticks, in supplejacks (vine-stems), pimentos (from the Engine piment pepper-tree , cabbage-stalks, orange and lemon-tree sticks, and the coffee-shrub and Indian briars. Numerous canes, the produce of climbing palms, and gigantic grasses, are also largely used by the stick-maker. The principal of these are the following:-rataus, dragons, and Penanglawyers, which are the stems of a species of calamus or climbing-palm, and are obtained from India, Singapore, Java, and Chinn-white and black bamboos, fluted bamboos, wangees, jambees,* and dog-head canes, which are the stems of various species of bambusa or grasses attaining a height of from 50 to 60 feet, and are exported from China; ground-ratans, large ground-ratans, malsecas, and drugous from Singapore. There are also the bumboo and jungle-bamboo imported from Calcutta; and, lastly, capes from Manilla

1. Itelity of the Bank—Prom mont of the forest-woods the bank has to be removed before the separated boughts can be made into polished stakes, but in some manipulate its the wrate-earth, the excremence of which are produced by an abnormal growth of the tree resulting from the paneters of an insect. As a half-penny is the from the paneters of an insect has a half-penny is the will be readily canceleded that there must be some simple means of facilitating this operation; and accordingly the stake are boiled for a couple of hours; the bank then stake are balled for a couple of hours; the bank then striped of without officials.

2. Forming the Crook and straightening the Stick.—Few limbs of trees or even canes, are sufficiently straight in their natural condition to answer the purpose of a walking-stick, and very few present those conformations which can be readily fashioned into handles; hence the necessity for these two operations, which claim our admiration from their ingenious simplicity. The handle is formed by softening the wood or cane in hot down sand, when it becomes pliable and non-elastic, and readily assumes and retains any curvature or bend that may be given to it. Minnte attention, however, is required with regard to the temperature for each description of wood; hence the precise degree which is proper for each can only be learned by long experience; and in cases where n new variety of material is imported, some experimenting becomes necessary. The straightening is performed in a similar mauser, excepting that the previous softening is effected in dry sand heated on an iron plate, that is in the ordinary sand-bath. When the stick has become suffi-ciently pliable, it is inserted into a deep notch cut in the edge of a strong plank, and is strained first in one direc-tion and then in another until it has become straight. The stick when softened takes any form much as a p of red-hot iron would do. The straightening-plank is three inches thick, about six feet long, and one foot wide, and is inclined away from the workman at an angle of

^{*} Biographical Sketches attached to Kay's Edinburgh Portruits, Part I.

The relative fashlousble value of some of these sorts of cane is satirised in The Tutler, No. 142, published on Tuesday, March 7, 1709-10. In that paper, "a plaid dragon" is charged at five guiness, and "a true jambee" at tea.

3. Finishming the Stick.—In this operation some sities are wrought to aname a twisted or giral form, and others the knotted appearance of a hambon or winages; and others the knotted appearance of a hambon or winages; the still represent the st

4. Staining.-After straightening or earving, the sticks are in many instances brought to a very smooth surface by means of emery or glass-paper, and finished off with fish-skin; and they are then, previously to the varnishing, unale to assume so many different burs by means of dyes, that the uninitiated would conclude that each was a perfectly distinct variety. The surface is likewise soot-times charged, and the charged portion scraped off partially here and there, so as to produce a very ornamental appearance. Sticks are also embellished with lithographic-transfers, but not in England, as hand-labour is too expensive. Malnecasennes, when not sufficiently long between the joints to form a straight stick, are made to appear continuous by reducing the larger part to correspond to the smaller, and tapering it gradually from the point of juncture. It then becomes necessary to colour that portion which has been reduced in size, and this is done with so much skill, that the stained and natural surfaces are not distinguishable,

Hitherto, mention has been chiefly made of sticks of vegetable origin. Of such as are made of animal substauces may be instanced whalebone, tortoise-shell, rnm's horn, rhimoceros horn and hide, as commonly employed for sticks; and occasionally the real bone of the whale, the spine of the shark, the hara of the narwhal, and ivory. The horns of animals under particular treatment with heat and by mechanical appliances, are drawn out into long cylioders; and tortoise-shell raspings are easily conglomerated by heat and pressure, and in the soft state formed into elougated rods applicable to the maoufacture of sticks. The hide of the chinoceros forms a very transparent horn-like substance, and is very clustic and tough. The feet of fawns, which are frequently used for stickhandles, are made to retain: he required form by merely haking them. Ivory, horn, and bone, are also largely used for stick and umbrella handles, and give, in their preparation for these purposes, employment to a considerable number of workmen,

Metals are not much used in the formation of the entire stick, but are restricted chiefly to the handles and ferules; still, however, iron sticks painted to represent wood and came are not unusual.

Baths, or common cases, although used for sirks, as more frequently employed as a substitute for visiblence more frequently employed as a fastistic for visiblence more frequently employed as a fastistic for the first two sees; they are merely spirit by hand to a before the substitute of the substitu

Before proceeding with the review of the contributions of the several nations, attention is claimed to the fact that London, Hamburg, Berlin, and Vienna, are the chief seats of the mannfacture under consideration, and that by n curious coincidence the principal makers in three of those cities bears the name of Meyer or Meyers. Two of them, namely, those residing in Loudon and Hamburg, are present by their works in the Great Exhibition; but the third, of Vienna, does not exhibit.

AUSTRIA.

The display of walking-sticks in the Austrian Section is very extensive, and has been contributed principally by two stick-makers; and also by a manufacturer of prpe-tubes, who has been rewarded chiefly for the latter article (see Ptres). Although the two other exhibitors have not received any Award, their contributions are deserving of favourable mention from their extent, cheapness, and goodness of workmanship. The largest exhibitor is A. Tatrus (e85, p. 1042), who sends a very extensive collection of sticks, from 9d. to several pounds each. They comprise most of the known varieties, and are generally ornamented with ivory handles, which, although not remarkable for any great correctness of form, are very well executed and very claborate, and many of them are exceedingly humorous. Taking the amount of work into consideration, the goods of this maker are generally low in price. The exhibitor next in importance in T Lepwio (679, p. 1042), who has contributed walkingsticks from 1s. each, but not ranging to prices so high as those sent by the maker already mentioned. His contributions are remarkable for their cheapness wherever much hand-carving is displayed,

Betown

The Walking-sticks in the Belgium Department are contributed by one exhibitor from Bruges (4, 6), and consisted entirely of a description ornamented with inlaying, which is well-executed.

BRITISH COLONIES. The exhibitors of Walking-sticks from the various dependencies of Great Britain are very numerous, and their countributious highly interesting from the variety of

materials employed in their formation; none, however, can be considered in any way as representing the art of stick-making in a commercial sense. From Western Africa is a stick, or rather, staff of honour usually carried before the African chiefs. Beside this, which was sent by Dr. McWilliam (5a, pp. 953, 954), are several sticks from the horn of the rhinoceros, contributed by Mr. HANBURY (28, p. 950), and a stained Quina walking-stick from the Greenkloof Missionary-station. From South Africa Mr. Hatpurs (21, p. 950) has sent some sticks of rhinoceros-hide. Brilish Griana is represented by two exhibitors, Mr. BEE (156, p. 987) and Mr. DUOGIN (148a, p. 986); the first of whom has sent a walking-stick made of the outer part or rind of the Tooroo palm from the River Demerara, and the second one made of a tree called letter-wood. From the Eastern Archipelago are ratans and bamboos contributed by P. HAMMOND and Co. (2, p. 988). The Indian Courts contain some very interesting specimens of decorated sticks, as they do of most of the ornamental arts, they are contributed by four exhibitors, beside the Honograble East India Company (p. 924). beside the Hosourable Last Isbla Contract p. 227). The specimens at present to be naticed consist of four bamboo-walking-steks, richly monated in gold and silver, sent from the Rajah of Ulwab); a stick enriched with a painted ornament, and mounted with silver, contributed by the RAJAH of KISKAGHUR (p. 924); sandal-wood and carved ivory Chorvess, or Whisks, from the RAJAH of BIEERTOBE (p. 924); an ivory walking-stick, with a guld ring; two Ivory Chowrees, one from Jodhpore, the other from Bhurtpore; and two Chowrees, made of the tail of the Yak (Bos Granicas), with silver bundles (p. 924). There is also a selection of walking-sticks of various descriptions, made at Calcutta, and in Corbin China; Betel-nut sticks and a Saudal-wood whisk from Calcutta. Most of these beautiful and interesting articles were purchased by the Company for the purpose of the Exhibition. The small collection from the Island of St. Viacrott (p. 978) consists principally of specimens of Supple-jacks; and from Triatilat is a walking-stick sent

by the Gavernor, Lord Hannis (pp. 974, 975). From Von Diesen's Lond are two contributions of walking-sticks, made with the hard portion of the bone of the whale, with beads carved out of the whale's tooth, one being sout by Sir W. T. DENISON (304, p. 998), and the other by Mr. T. SCREEN (305, p. 998); and there is also a stick made of the Oak of Tasmania (Converns quadricales), con-tributed by the Venerable Archdeacon Marriott.

In the Chinese Court is a hamboo walking-stick, enriously carved, which was contributed by Mr. F. S. Can-PENTER (33, p. 1425), in addition to which may be men-tioned two Chinese sceptres, one from HER MAJESTY'S Cossc. at Shandhas (28, p. 1420), and a still more in-teresting and elaborately curved specimen contributed by Mr. P. P. Thoms (16, pp. 1422, 1423), of Warwick Square, a full description of which will be found in the Itsustrated Catalogue. It would appear, from Mr. Thom's account, that it dates from 2169 years n. c. These specimens, however, must be regarded as mere cariosities, and in no way representing the commerce of China in this branch of trade, which as regards the raw material is very important, large quantities being annually exported. From Canton alone 1,200,000 sticks of various kinds were exported in 1846, consisting chiefly of different kinds of cases and bamboos, but comprising also laurelsticks, stems of the tea-plant, and the root of the fig-tree uf the Pagodas (ficus indica),

The French Department contains some very elegant examples of walking-sticks, which have been sent principally by an exhibitor noticed in the List of Awards; but specimens were also exhibited by the umbrella-manufacturers, who have been spoken of under the preceding article. In-deed many of the underella-manufacturers of France are also makers of walking-sticks and riding-whips. France does not export a very large quantity of walking-sticks, on account of the far less cost of production in London and Hamburg of the ordinary descriptions, and in Vienna of those with elaborately carved handles. The chief specimens sent by the Prench stick-makers, and also by the umbrella-makers, consist generally of articles made of clongated ram's horn and conglomerated tortoiseshell. 1847 there were, in Paris, one hundred and sixty-five manufacturers of walking-sticks, and riding and drivingwhips, employing nine hundred and sixty-two workpeople, who produced goods valued at 140,320/. The journeyman, who in Paris works by the piece, earns from 2s. 10d. to 4s. 10s, per day; and a skilful engraver or enchaser about 7s. 3d. per day. The workwomen earn from 1s. 2d. to 1s. 10d. per day. M. Natalis Rozdot quotes 12,000l. as the annual value of the productions of the largest manufacturer in Paris; but this estimate comprises also riding and driving-whips. About nine-tenths of these articles are exported. The imports of lamboo-canes into France are as follows:-

Years.	Rembose and Large Canes.	Ratans and other small Canes
-	Cuts.	Cuta,
1830	146	126
1835	254	468
1840	610	1,820
1845	828	4,120
1850	950	3,606

HAMBURG

The most important display of walking-sticks is undoubtedly that in the Hamburg Department, contributed by H. C. Meyer, jun. (86, p. 1139), who it appears is the most extensive stick-maker in the world. His collection contains about five bundred varieties, comprising most of the known materials. This exhibitor, who in Hamburg employs between two and three hundred workpeople, has also a branch-establishment in New York. There is also a small collection from another exhibitor of Hamburg,

which, being a free port, possesses an almost equal ad-vantage with London in regard to obtaining materials free of duty, and is generally a large purchaser at the Colonial sales in London of all the productions obtained frum the British dependencies. Being placed on an equality in this respect, Hamburg has another great advantage in the cheapness of hand-labour over London, and is consequently a most powerful rival in the mannfacture of sticks.

HESSE.

From the Grand Duchy of Hesse is contributed a collection of sticks, ornamented with transfers from paper, printed by lithography, and which are produced at so low a price as to defy the competition of Hamburg or London. Large quantities of these very neat productions, imitative generally of sticks covered with plait, are annually exported to England and America.

There is one exhibitor who sends good articles from

SABBINIA.

There is one exhibitor of beautifully finished plain sticks, which, although comprising few varieties, are very meriturious. SWITTERLAND

TUSCANY. The contributions from Tuscany consist of five walking sticks, composed of numerous pieces of born, with haudles

UNITED KINGDOM

The manufacture of sticks in England is in an increasing and most flourishing condition; for not only are the goods for home-consumption chiefly made in this country, but Great Britain also possesses a very large export trade in the finished article, and almost exclusively supplies the Continent with the raw material with which her markets are abundantly furnished from all parts of the world. To give some idea of the extent of the trade, it may be stated that the principal Loadon maker prepares manually 80,000 bundles, which are equal to 2,500,000 ratans, principally for parasol and umbrella ribs; and he also sells annually the subjoined quantities of manufactured sticks, viz.:—

Partridge canes	_	_	-	-	-	-	60,000
Bamboo canes	-	-	-	-	-	-	80,000
Malacea canes	-	_	_	_	-	-	110,000
Dragon caucs	-	-	-	-	-	-	100,000
Ground ratans	-	_	_	_	-	-	15,000
English sticks,	such	RS	onk,	26	h, er	nb,	144,000
maple, &c							

Polished ash-sticks are chiefly manufactured at Birmingham, where they are sawn out by machinery, and subsequently turned and polished. At present the English maker is unable to compete with the German manufacturer in producing sticks ornamented with transfers from printed papers, but probably the substitution of letter-press for lithographic-printing would turn the scale in favour of

The importation of walking-sticks is, however, very small as will be seen from the following table :-

Walking-sticks are sent by thirteen exhibitors, whose productions are dispersed in various divisions, as, for example, in Classes VIII., X., XVI., XXII., and XXIX. These specimens comprise many instances of the em-

ployment of walking-sticks for containing various implements, alluded to in the introductory matter. Beside the instances there quoted, are to be found-a walking-stick which serves the purpose of a miniature wine-cellar and larder (Class XVI., 81, p. 522); one which contains a voltnic-battery (Class X., 423, p. 455), which continually sub lects the owner to an electric current; one (Class XXIX., 183, p. 8(8)), to contain guide-maps, and I wo or three others convertible into seats, umbrellas, and other instruments.

LIST OF AWARDS.

BAGRE, -- (France, 1123, p. 1232), Honourable Mention is accorded for a collection of walking-sticks made of ram's-horn and tortoiseshell.

Ctaupo, Joseph (Sardinia, 68, p. 1304). Prize Medal for a collection of well-manufactured walking-sticks, com-

prising several varieties of wood. FRANK, J. G., Offenbach, (Grand Duchy of Hesse, 61,

p. 1129). Hononrable Meotioo is accorded for a large collection of well-made and very cheap walking-canes, which are ornamented with tartan and other patterns, transferred from lithographic impressious on paper, and then highly varnished; and also for papier-maché souff-

HEDINGER, C., Stuttgart, (Wortemburg, 92, p. 1119). Prize Medal for a collection of Malacca walking-sticks, partridge walking-cases, umbrella and parasol sticks, and

some few ambrella-frames. The goods exhibited are well made, and at very reasonable prices. MEYER, II. C., jun. (Hamburg, 86, p. 1139). Prize Medal for a most extensive assortment of excellent walkingsticks, sword-sticks, and dart-sticks, the mounts of which are, in most cases, tastefully designed and well executed The collection comprises also split whalebone, plain and fluted, which is used for covering sticks, whips, operaglasses, and telescopes,

MEYERS, BARNETT, 18 Crntched Friars (Class XXIX., 140, pp. 797, 798). Prize Medal for a very large and inter-esting collection of cames and sticks of various descriptions, in the raw state, which comprises all the principal varieties. Also parasol and umbrella ribs of dyed ratan; cane-ribs for milliners, cap-makers, whip-makers, and chair-makers, together with an excellent collection of highly-finished walking-canes, sword-sticks, and dart-sticks, the mounts of which are good in design, and of the

best class of workmanship.
SCHULE, C., Essen (Prussia 593, p. 1083). Prize
Medal for a collection of well-made walking-sticks, and sword-canes, which are well manufactured, and are sold

at reasonable prices.

Torri, L., Florence (Tuscany 111, p. 1298). Honourshle Mention for a collection of walking-canes composed of numerous pieces of horn of different tints.

Upwards of 3000 years ago the artist of ancient Egypt paioted the fan on the walls of the tombs at Thebes. There the Pharnoh sits surrounded by his fan-bearers, each in his due rank; and there is seen an investiture of a fan-bearer, which realises the description to Genesis of the honours paid by Pharnoh to Joseph. The office of fan-bearer must have been honourable, and the insignia of office were long slender vividly coloured fans on variegated or twisted handles: in war the same officers acted as generals or marshals, using their fans as standards; and in peace they assisted the Pharaob in the temple, and waved their variegated fans both to produce a cooling breeze, and to guard the sacred offerings from the contamination of noxions insects.

the contamination of noxions insects. The flux is mentioned by horspieles, and its origin from "barbarous countries," its use in Greece was similar to The mean of the contamination of the contaminat taken and spread out somewhat in the form of a semieirele, hot pointed at the top; a thread connected the feathers at their base, and another near their summit, and the fan thus made was fixed in a handle. This fan, the precise type of the state-fan of India and China of the

present day, was waved by a female slave.

The fan, according to Virgil and Apuleius, was sacred to Bacchus, and the "mystics Varaus Incchi" was carried in procession in the feast of that deity, as well as in the Eleusinian Mysteries. Its appellations multiplied, though its office remained the same, and it was termed indifferently "Flabellum" or "Muscarium."

The modern Greek church is careful to place a fan in the hands of its deacons to guard the officiating priest and the elements from desceration.

The Roman ladies certainly enjoyed the luxury of the fan, which, gorgeous with peacock's feathers, or delicate with the tinted plumes of the ostreth, could not yet be fielded, and rendered the services of an attendant

In the works of the middle ages references are made to the two forms of the fan, to that employed for winnowing the grain, and that used in the service of the church alternately to court the breeze or wave away the flies, till we hear of the fan as brought to France by Catherine de Medicis, when it was no longer stiff and unviolding, but light and pliable. In the early part of the seventeenth century, it was so constructed that it could be folded in paper and perfumed leather, it became the delight of the French Coort; and attracting the attention of artists, fans in the luxurious reigns of Louis XIV. and Louis XV. (in the latter under the name of "Pompadours") shone with gilding and gems, and at length glowed with the pictures of Boneher and Watteau; until at length no toilet was esteemed complete without a fan, the cost of which was frequently in those days as high as from 121. to 15t. sterling. In Italy, on the contrary, in the early part of the seventeenth century, even painted fans were part of the seventeenth century, even painted hais were of a very moderate price, and of universal use. "The first fans," says Coryat, in his Travels in 1608, "that I saw in Italy, I did observe in this space between Pizighiton and Cremoun; but afterwards I observed them common in most places where I travelled. These fans both men and women of the country do earry to cool themselves with in the time of heat by often faming of their faces. Most of them are very elegant and pretty things. For whereas the frame consisteth of a painted piece of paper and a little wooden handle, the paper which is fastened into the tops is on both sides most euriously adorned with excellent pictures, either of amorous things, having some witty Italian verses or fine emblems written nuder them; or of some notable Italian eity, with a brief description thereof added thereto. These fans are of a mean price, for a man may huy oue of the fairest of them for so much money as countervaileth an English groat."

England must have been agreat buyer of fins in the last century, as a budy of that privid would have felt as a ward without her fin as a gentleman without this secord. Indeed Addisson makes the comparison, and in secord. Indeed Addisson makes the comparison, and in the fin is taught. "In the finter of a fam," he observer, "there is the angong future, the moder future, their construct, the confused flutter, the merry flutter, and the amorous flutter," He says, "I have seen a fin as a backet forer who provoked it to have come within the wind of it."

Gay again gives the fan as a present from Venns to a despairing lover, in order to soften his mistress, and describes in verse the laint which the peacock's tail presents for its construction.

CHINA.

The frame is made of the feel of the "Feelle". The frame is made of the feel
The leaf or feuille is sometimes single, but more often double; and it is usually made of paper lined with all or eaties, but also of parchiment, lamb-wkin, ratio, and water-colours on veillam, by artists to extend the supernature of the supernature of the supersistence of the supercolours of the superties by artists of ecletivity, since Blooder and Waterson, familie Bospetheir signatures to fast which they have decorated. The devices on the more ordinary descriptions of fina are partial from copper plates, and soluently hand, and extense-of-thempoly, we returnated by the precent

The feullike is foliced in a mould of strong paper, and is then mounted on the frames and gined to the perologiations or "Best" of the inner ribs. The feuille of the best fins is after this painted on the edge with gold-size, and gift with leaf-pold; but the feuille of the common fins is printed in Dutch motal; previous to it being ensemted on the frame. The decorate row or ensuests that frame with gold or closed to the control of the control of the strong the control of the control of the stateshes the sate sels, and selvent the proper sized sheath into which she places it.

The frame or "Pied" is made in the parishes of Andeville, the Deluge, the Boisière, Corbeil-Cerf, and Sainte Generière. In the district situated between Méra and Beauvais, in the Department of the Oise, 2,000 workpeople, men, women, and children, are employed in the fin-traile. The woods used are the beam-tree, the plamtree, ebony, saindal, and the lime-tree. The dexterity

^{*} Etude pratique du Commerce d'exportation de la Chine, hy Natalis Rondot, pp. 92, 93.

and sureness of hand of the possant workman are said to be quite wonderful. Considering his wart o knowledge of the principles of drawing, his facility in engraving, scapitaring, and sellong, in certainly resultable. The scapitaring has been supported by the scapitaring of the the workman makes for himself with pieces of watchspring. A reasthable piece of san-priering in the skape of a mother-of-poor! fan in exhibited in the French Section, No. 169; it centalizes no less than 1,000 for the scape of the scape of the scape of the scape of one of one of those possant artisans, named Device Pietry.

The printing, the colouring, and the mounting of the feuille, and the final embellishment of the fan, are usually performed at Paris, under the direction of the fan-maker, called par excellence "Ecentailliste;" though he has really but little to do with the nanufacture of the fanand must be regarded rather as the collector into one focus, and arranger of the produce of others; yet his labours are not the less essential. The mounting of the femille, its ornamentation with feathers, and final deco ration, are the operations usually performed by a small number of workpeople in his own establishment; be-sides which he furnishes the drawings to the peasant in the Dise, for the framework to suit the constant changes in fashion, he instructs his feuilliste as to the style of ornament, he groups together the frames and feuilles, and finally he overlooks the whole to see that the workmanship has been well executed. Except the mount-ings of the feuille and the final adorning of the fm, the other operations are usually performed by workmen at their own homes. The number of fan-makers or Ecentaillistes in Paris in 1827, was 15, who employed 1,010 workmen (344 men, 500 women, and 166 children), and sold about 40,420l, worth of fins. According to the our colleagues M. Natalis Rendot and M. Say, it appears that in 1847, there were 122 fan-makers, comprising colourers. The value of the fans made was 110,000.1 These masters employed 575 workpeople (262 men, 264 women, 29 youths, and 20 girls). The workmen on are working on the average earn 3s., and the women 1s. 8d. per day.
The men were for the most part copper-plate engravers and printers, lithographic draughtsmen and prioters, painters, and colourers; the women were mounters, illnminators, painters, colourers, and overlookers. Thus in twenty years, it appears that the produce in fans had increased in value nearly threefold, whilst the number of workpeople had diminished to one half. This change is to be attributed to the employment of machinery; especially of the fly-press in stamping out and embessing the ribs, and the extensive employment of chromo-lithography, an art not practised at the former period. By these means the French have been enabled greatly to increase their exports by the production of cheap fans, to compete with those made by the Chinese. P. DUVELLEROY France, 495, p. 1201) exhibited some small fans, the price of which was as low as 5d. per dosen,

The callection of flam in the Forech Department is more complex, and remains reveral specifyll occurred in more complex, and remains reveral specifyll occurred in Albert. Bookie there and others, painted by first-rate artists, it comprise most off the deverging toman marketered extended of the complex of the complex of the complex of the complex of the market for which they are detributed for instance, some diday great differences in the length of the market for which they are destined, and the complex of the c

BRITISH COLONIES.

The colonial dependencies of Great Britain contribute many examples of Fans, some of which are interesting on account of their simplicity, whilst, on the other hand, those from India present most striking proofs of the luxurious splendour of the Indian princes. British Guisnes. Internous spendour of the intain princes. British dissipation of the Ita-palm. Condity, A fan of somewhat similar nature, but made of the bark of a tree, is contributed by Miss Ilelen Romerea (175, p. 967). Cogline. There are several rich "Puntahas" or fans, and a richly-painted troy fan-handle from this island. India. The Indian Department contains fans or Poubots in great variety as regards form and decoration and the material employed, some of them being of a very costly description, some of them being of a very costily description. There are, for example, two fins contributed by H. H. the Rajam of Kota (p. 924), one with an ivory handle, the other with a gold handle; but as the names of the various manufacturers were unfortunately not ascertainable at the time the Jury examined these specimens, no prizes were awarded in their Savour. The Indian fan differs from that of Europe and China in not closing, and likewise in its form; and it is usually kept in motion by an attendant. Beside the fans alfixed to central handles, all of which are most gorgeously enriched with embroidery and jewels; there are exhibited others resembling a curtain suspended from a silver rod, which is held horizontally by the attendant, and waved backwards and forwards over the head of the wealthy lliudoo: and there is also the circular standard-fau: the handle being a silver staff, crooked at the top, to which the fan is attached on the side opposite to the crook. The attendant stands by the side of his master, and placing the end of the staff against his foot, inclines it away from his body and slowly swings it to and fro. There is also a heautiful peacock-feather fan from Assam, and a fan or Possible, composed of China beads and pearls, and made in the city of Delhi. The most simple, however, are those made of the entire or the divided leaf of the Bornson Rabelliformis, manufactured at Calcutta, and commonly used both hy natives and Europeans. The other examples comprise, a punkah made of khus-khus grass (Andropogos nouricatus) which, when wetted, emits a fragrant perfume; fans made of sandal-wood, from Calcutta; a fan made of bamboo from Moorshedabad, and several of similar description from other parts of India; and lastly, from Bengal, large and hand-fans, made of the palmyrn-leaf. As far as the Reporters could ascertain the names of the contributors. it uppears that, besides the faus from the Rajah of Kota, before named, several of the examples were sent by the RAJAH of PATTIALA (p. 924), the RAJAH of JODHPORE (p. 924), the JUBBULPORE SCHOOL of INDUSTRY (p. 924), and Captain Datron (48, p. 791). The inspection of these heautiful productions of Indian workmen, unturally suggests the idea that their skill and remarkable taste might be turned to profitable account, if directed to the production of fins suitable to the European and American markets. Nove Scotis (p. 970) sends an example of a very simple Indian fan. Trinidal. Lord Hanars, the Governor (p. 975), sends examples of fans for Indies, And from Westers Africo, Mr. R. JANESON, of Liverpool (22, p. 955), exhibits several fans from the banks of the

Niger, one of which is made of a species of grass.

A few specimens of fans are exhibited in the collection from Egypt, to which much interest attaches, as coming from a country in which, possibly, the fan was first devised.

SPAIN.

There are two exhibitors of flats in the Spanish Court, one of whom excentinates painted and also printed "Fouller," and the other both feullist and complete flats, some of which are copies from French models. The camples, which are copies from French models. The camples, execution with the splendid flats from France, are good of their kind; and it would appear that the attention of their calibitions has been directly rather to the manufacture of or arr. But it is remarkable, that no fluer specimens should have been sent from a country in which the use of fans is so prevalent that they are commonly offered for sale outside the arena of the hull-fights and uther places of amusement.

The fans in the Tunisian Court are ten in number, and are in some cases ornamented with rich embroidery.

TURKEY. The only example is an embroidered fan made at Adrianople.

WURTENBURG, Several bone and ivory fans are exhibited by M. C. STOLL of Ulm, they are reasonable in price, but not nearly so good as the ivory-fans contributed by the Freuch

The number of exhibitors of fans is twenty-three; of these, there are: -

2 Holders of a Prize Medal. 1 Who obtained Honourable Mention. 20 Unrewarded.

23 Total.

LIST OF AWARDS.

DUCAGT and PETT, Paris (France 149, p. 1178), Honograble Mention for a collection of fans in ordinary demand and at reasonable prices, namely, from 5d, to 40s, each; also excellent examples of pierced and sculptured ivory and mother-of-pearl fans, one of the specimens of which has been before alluded to in the introductory These are of much higher quality, and range in price from 31. to 121, each,

Develleroy, P., Paris (France, 495, p. 1201), Prize Medal for a display of fans ornamented with artistic paintings, and remarkable for the beauty of the inlaving, and the pierced ivory and mother-of pearl frames. most elegant fan in this collection is one painted by Roqueplan; the ribs are of richly-pierced and sculptured mother-of-pearl inlaid with gold, and it is valued at 404. Beside the above, others intended for foreign markets were exhibited, the prices of which vary from 3d, to 40s.

FELLY, ALEXANDRE, Paris (France, 199, p. 1183), Prize Medal for a collection of fans, being for the most part copies of the best examples of ancient fans: these, although not possessing the merit of originality, are such remarkably beautiful specimens of vellum-painting, that they fully entitle this manufacturer to the award, and are moreover the richest of any exhibited.

V. PIPES AND AMBER MANUFACTURES.

Before discussing the merits of the pipes contributed from all quarters of the globe to adorn the Great Exhihition, it will be proper to notice the materials principally employed in their manufacture. Clays, of different kinds, are more used than any other

substance in the formation of pipes: Inst as their nature and composition will probably be fully discussed in the been abstracted.

Special Report on the fictile-arts, of which clay pipe usaking is comparatively but a small branch, it is needless here to describe them

Woods of several descriptions are next in importance. The wild cherry-tree, and the jasmine are the principal sorts, and great care is bestowed on their culture to ensure their growing free from knots and identishes; the young stems of the jasmine being wound round with cloths to effect that object. Lemon-tree and clony are also in re-quest, the latter being generally used for carved tubes.

which of perel, Horn, Forey, and Hore are extended Mother-of-perel, Horn, Forey, and Hore are extensively used; nor are the precious notath and costly gone excluded from a share in the formation of the pipe. But these have not that intimate connection with the subject under notice, which appertains to two materials-Merroleman and doder, whose names are emphonious to the ear of the rennine smoker. The former substance is devoted exclusively to his use; and the latter though not entirely his own, pays to him a very considerable tribute, in the form of month-pieces.

So early as the year 1609, the genuine meerschaum just have been held in estimation in England; since Dekker appears to refer to it in his "Golf's Horn-book when he wishes his gallant to be able to discourse " which pipe has the best bore, and which berns block, and which breaks in the burning.

Meerschoon (Econo de mer) is a mineral of somewhat rare occurrence. It consists of magnesia, silica, and water, and may be called a hydrated silicate of magnesia (MgO, SiO2+HO). As the compound is not crystalline. its constituents are variable, and thus silicates of iron and alumina are often found in combination with it. These affect the colour of the meeyschanm, which when pure is quite white. Siliente of iron frequently occurs, and gives it a tinge of colour, varying from the palest yellow to a deep brown. Good meerschanm is tolerably soft, it resists the pressure of the hand, but is easily indented by the finger-nail, and, especially after having been wetted, may be easily cut with a knife. The fracture is generally earthy, and rarely conchuidal; still the state of aggregation of even pure meerschaum is very variable, as is proved by the marked differences in its specific gravity. Some kinds sink in water, others float un its surface; these qualities in the estimation of the pipe-maker, are indicative of different values, for he rejects both the very heavy and the very light, and prefers those of medium density. The light varieties are generally very porous, and even contain large cavities, whilst the heavier kinds he suspects to be an artificial product.

Mecrochaum is met with in various localities, in Spain, Greece, and Moravin: but by far the largest quantity is derived from Asia Minor, it being dug chiefly in the peniusula of Natolia, near the town of Coniah. Formerly the material was roughly fashioned on the spot into bowls. which were more elegantly carved in Europe. The art was especially cultivated in Posth and Vienna, where it formed an extensive and important branch of trade. These rough bowls still occur in commerce, but by far the greater part of the mecrachaum is exported in the shape of irregular blocks with obtuse angles and edges, requiring careful manipulation with the aid of water, in order to remove irregularities and faulty portions. A beautiful specimen of meerschaum thus cleaned is contributed by LUDWIG HARTMANN (Austria, 675; and there is also a box of meerschaum earth in the Greeian Department, 23). This preliminary treatment still leaves namerous blemishes, and the meetschaum of commerce has defects of various kinds; besides various minerals scattered through its mass, it contains a hard sort of meerschaum, which the mannfacturer calls chalk (Kreilemassen), and which is the cause of much difficulty in the earving.

Previous to the mechanical treatment of the meerschaum* for making the bowl, it is subjected to a certain preparation. It is soaked in a liquified unguent composed of wax, oil, and fats. The wax and fats which the sub-

* This subject is ably discus: under the head * Meer-haum," in Precht's "Encyclopicitic der Gewerke und schsum," in Prechtl's "Encyclipatic art creation Konste," from which some of the foregoing remarks have stance absorbs, cause the colours which mecreclaum assumes after masking. Under the influence of the heat produced by the lurraing tolacco, the wax and fats pass through all the stages of a true process of dry distillation, the substances thus formed become associated with the products of the distillation of the tolacco, and by their colour which are so highly prized by the commensuring the produced of the colours which are so highly prized by the commensuring the produced.

Occasionally, though rarely, the bowls are artificially stained by dipping them, before they are souked in wax, in a solution of copperas (sulphate of from) either alone, or mixed with one of dragon's blood. This process must manifestly affect, very materially, the shades of colour produced in stonking.

Attempts have not been wanting to initiate meerschaum, the process being rather mechanical than chemical; for nilthough chemists have of late been very successful in the artificial production of minerals, for instance palagorite (Bansen, spinelle; Ebelmen, verystallized carriomates: Senarmont), no one has attempted the production of meerschaum, chemically.

The large quantity of meerschaum parings that are left in roughing out the bowls would entail considerable loss, unless some process had been devised of rendering them available. A species of meerschanm bowl has long been known in commerce under the name of Mana-khade massa bowls), which is made from the parings; these are triturated to a fine powder, boiled in water, and moulde i into blocks with or without the addition of clay, each of these blocks suffices for one bowl; but before they can be used they must be allowed to dry for some time, as they contract considerably. Specimens of composition pipe-bowls and eigar-tubes are exhibited in the Austrian Section (687). These bowls are distinguished from real meerschaum by their greater specific gravity, but there is no very certain test by which the real meerschaum can be distinguished from the composition, and many suppose that all the beavier descriptions are spurious, though there is no alsolute proof of this being the case. A negative test may however be mentioned; the composition bowls never exhibit those little blemishes which result from the presence of foreign bodies in the natural meerschaum, therefore if a blemish ocear in a meerschaum bowl, which is very frequently the case, the genutueness of the bowl is rendered most probable; but as these do not show until after the bowl has been used for some time, the test is not of much value.

Assier. - The most extensive use of this elegant material is for the manufacture of the mouth-piece, constituent of the gennine meerschaum and Turkish pipe. Up to the present day, amber mouth-pieces continue in great request in the East, where they fetch very high prices, instances of which will be quoted. There is a current belief in Turkey that amber is incapable of transmitting infection, and as it is a great mark of politeness to offer the pipe to a stranger, this supposed negative property of the amber accounts in some measure for the mation in which it is held. In the Christian countries of Europe, ivory, hone, and horu, have to some extent usurped the place of the more costly material, which is reserved for the higher class of pipes. Amber is also much employed in numerons small fancy articles, espe-cially for beads, necklaces, brooches, and earrings. The Exhibition furnishes also examples of its being worked occasionally into candicaticks, salvers, pipe-tubes, and other larger articles. The coarser descriptions and chips of amber are also employed for the manufacture of va nish, and the preparation of amber-oil and succinic acid, which it yields by distillation at a moderate temperature. Copal, which bears a strong resemblance to, but is much cheaper than amber, is occasionally substituted for it, frandulently or through ignorance. There is no difficulty in distinguishing the two by a chemical analysis, but this renders the sacrifice of a small piece of the substance necessary; some varieties of amber, especially the dark yellow and transparent descriptions, are searcely to be distinguished, unless by n well-practised eye, from copal. A few words may be said respecting the ebemical characters of amber which, however, do not affect its

employment in manufactures. According to an analysis of herzelius, it contains a volatile oil, succeinie acid, two resins soluble in alcohol and other, and a complex bituminous substance (succinic bitumen) which is not affected by any solvent.

by any solvent.

The mode of obtaining amber is peculiarly interesting. The greater part is found on the coast of Prussia Proper, especially between Königsburg and Dantzie; it is distinguished as terrestrial and marine amber; the former is dug in mines, and is generally found in alluvial deposita of sand and clay, associated with fossil wood, iron pyrites, and alum shale. Amber is also found in some other countries, but never to any amount. The marine amber is east ashore during the autumnal storms on the coast of Ponceania and Prussin Proper. It is then picked up, or fished for with small nets. There are several fine specifished for with small nets. There are several fine speci-mens of both descriptions of nuber in the Austrian Section. (675, p. 1042), and in the Prussian Section (438, 441, 40, and 41, pp. 1075, 1050). In the case bearing the latter number are specimens of land amber, and the fossil wood associated with it which were obtained at a depth of associated with it waters were obtained at a depth of 60 feet by the exhibitor, M. TESKLER (41, p. 1050), who employs about 20 workpeople in his amber-pits. The opinious respecting the origin of amber are very divided, some hold the view expressed by Tacitus in his Germonia, that it is a resin exuded by certain conifers, traces of which are frequently observed among the amber. Others assume it to be a species of wax or fat, having undergone a slow process of putrefaction; and they base their views upon the fact that chemists are able to convert cerous or fatty substances into succinic acid by inducing oxidation artificially. It is quite certain that at one time amber autificially. It is quite certain that at one time amber tunst have been liquid, for numerous small animals are found coclosed within it; these for the most part are insects belonging to an extinct species of Arnolmide (40), There are numerous and excellent specimens of amber enclosing insects in the Prussian Section (441), and others case which deserves favourable mention from D. T. TESSLER, who has sent one specimen containing the leg of a toad.* The processes which nature employs for the preservation of the structure of extinct insects, is one which the microscopist successfully imitates by embalming bis delicate dissections in Canada balsam between two slips of glass.

There is evidence of the extreme antiquity of amber in

the fact that the Phonicians of old fetched it from Prusia. Since that period it has been obtained there uninterruptedly, and no diminution in the quantity annually collected has been perceived. This would almost induce a belief in the correctness of the outrefaction theory, above alluded to, and we may perhaps assume that a constantly new formation of amber is taking place; this view is somewhat strengthened by the different appearance of the varieties of amber, which seem to exhibit the successive stages of its development and decay: still this conclusion to many will appear strained. The different kinds of amber are distinguished by varieties of colons and degrees of transparency. It is found of all shades of yellow, from the palest primrose to the deepest orange, or even brown. In point of clearness amber varies from vitreous transparency to perfect opacity, specimens being obtained nearly as white as ivory; in this latter case the transformation is assumed to have advanced further than in the ordinary varieties. It is rarely found, and is chiefly used for earness ornaments, and is mounted on darker amber which forms the back ground. Several examples of its employment are exhibited in the Prussian

An inopairy naturally suggests itself as to which of these varieties of suber is the most valuable. It is selfcrident that this must depend, as in the diamond, upon the size and the eniformity of the pieces. Besides, as all the varieties, excepting the white, which has its special nees, are equally popherable for manufacturing purposes, and the property of the property of the property of depend in a great measure upon its rarity. The strayyilow, slightly cloudy, translatent variety is the most

* According to M. Natalis Rondot, specimens of amber contairing juscets are of frequent occurrence in China.

rare, and in that which the Orientals prefer to all others, and which they purchase at extravagant prices. There are few specimens of it in the Exhibition, and it is needless to search for them in the German Department, as every piece that is found to Prussia is exported to Turkey in the raw or manufactured state; and it is in the section occupied by this latter country (1928, 1929) the only specimens in the Exhibition will be found.

Some writers are of opinioo that the preference which the orientals show for the pale yellow, slightly clonded variety, has been transmitted to them from the ancients, but their argumeots will not bear a close examinatioo

Having alloded to this matter, it will be as well to advert to the opinions held on the sobject by the nucleut authors. It appears that the word "electron" (amber) had two significations; one referred to the substance which we call amber, hence the derivation of the word electricity, from its long-known property of attracting, when rubbed, light sub-stances, such as straws, which was the first electric phenomenon ever observed; the other meaning applied to an alloy of gold and silver found in nature, or produced artificially. Pliny expresses himself very clearly on this point; he says that gold always contains ailver, and that when the silver amounts to one-fifth of the compound it is termed "electrum;" if the proportion is higher, the electrum ceases to be malleable.

It has been assumed that the latter was the original meaning of the term, and that it was subsequently applied to umber on account of its resemblance to the white gold, to umber on account of its resemblance to the white gold, the variety most closely resembling the alloy possessing the highest value. This view is supported by the circumstance that we find "electron" profess of by the epic poets lesiod and Homer as employed in articles for which assure you will be supported by the population of the polyectron, for instance, of amber for sheltda might cause some slarm for the safety of the Homeric heroes. But the ancivot poets did not always pay minute attention to the natural qualities of the materiols which they meetioned in their narrative ; this is evident from Hesiod's employing other fragile substances, such as ivory and alabaster in the manufacture of shields. Moreover, the fine carving of these show-pieces was not adapted to resist heavy blows. The learned Buttmann (Abandlanoes der Berliner Academie 1818, 1819), very correctly observes that these works of art are derived by the poet direct from the workshop of Vulcan, and that this at ooce does oway with any protest Vuican, and that this at occe does oway with any protest against the insecurity of vory, albaster, or examel to the manufacture of his shields. The same learned anti-quary has compared critically the most important pas-sages in which the word "electron" occurs, and he has demonstrated, incoorrovertibly, that the word originally meant amber, and that the accord interpretation has only meant amber, and that the second interpretation has only been introduced at a later period, especially by the tragic poets. Thus it follows that the transmission of the predilection for the straw-coloured cloudy amber from the ancients is far from being proved, and that we must content ourselves with the explanation first attempted of its resulting from the greater rarity of this kind of amber. This predilection appears to be coofined to the East, as io other countries, e.g., Russia, the orange-yellow transparent variety is decidedly preferred, possibly on account of its elempness. The Russian peasant girls adorn themselves with double ond treble rows of amber beads; though frequently they are supplied with mere copal-bends iostead of the genuine article.

Having made these general observations on the character of amber, we pass to the detailed consideration of what has been presented to us to the Exhibition order the head of Pipes and Amber Manofactures.

 Historia Naturalis, xxxiii., n. 4. Omni anro inest argentum vario pondere, siibi dena, siihi nesa, siihi octava gentum vario pondere, siibi dena, alihi nona, alihi octava parte. Ubinnaque quinta argenti portio est, nietrum vocator. Pit et eura alectrum argento addito; quod si quintam partinome excessii, incudibus non resistit. Et electro suctoritas Homaro teste, qui Menelai regiam auro, electro, argento, ebori fulgera tradit. Jd. Paga 460, vol. li., ari Holland's Transiation.

GERMANY.

No one will be sorprised that this lood of smokers bears off the palm in the manufacture of pipes and amber; nor that her exhibitors outnumber those of all other nations that her exhibitors outnumber those of all other nations collectively. All the States of Germany, however, have out contributed equolly, the pipes being chiefly from Austria, and especially from Vienne, and the amber-manufactures from Prussin. The mecrechnum works of the Viccooses are unrivalled, as regards taste lo design and excellence in execution; the carving of many of the pipebowls and eigar-tubes being examples of highly-cultivated art. Most of the fancy pipe-tubes, composed of horn and art. Most of the lancy pipe-tubes, composed of norm and mother-of-penf, are more curious than gracefol; the cherry-tree tubes are in great variety, and are good examples of this component of the log pipe; besides there, there are large numbers of bene and wood mouth-pieces, and others made of omber, the latter being bene-pieces, and others made of omber, the latter being benetifully worked.

The meerschaum pipes from Prussis are not comerous, oor are they so elaborate as those of Austria. The Prussian Section presents such a series of amber specimens as are oot likely to be again collected; the manufactured amber dors not, however, evince much feeling for artistic design on the part of their exhibitors, whose marits rest principally oo the excellence and difficulties of the workmanship.

The contributions from the other parts of Germany consist of meerschaum and other pipes from Bararia, which are oot remarkable; porcelaio pipes from Homburg and clay-pipes from Nassau. Those from Hamburg are of fancy forms, and those from Nassan are chiefly plaio descriptions, which are sold at exceedingly low prices.

BRITISH COLONIES.

Brillish Guianz.—T. B. Duggin (146, p. 986) sends a specimes of a pipe, or rather tube, used by the aboriguies for smoking tobacco, called a Wioos; it resembles o cheroot in outward appearance, but is hollow so as to contain the tobacco. It is said to be made from the rind of the fruit of the Manicole-palm (Arcca municol, Lodd.), from the River Berhice. It may be remarked that such tubes, made of paper covered with a leaf of tobacco, ore now manufactured in England. County contributes a collection of well-made clay-pipes. The Indian collection contains examples of the costly and beantifully-orno-mented cocos-ant and lae Hookahs, mounted in silver with their rich tubes or soakes, and the simple pipe com-posed of two pieces of hamboo, one for the bowl cut close to a knot, and a smaller one for the tube. These primitiva pipes are io common use amongst the poorer natives of India, and yet Dr. Royle cites an extemporary pipe sometimes used by the natives, which surpasses even this to simplicity; the amateur makes two holes, one louger than the other, with a piece of stick, in a clay soil, in-clining the stick so that they may meet; ioto the shorter clining the stick so that they may meet; ioto the shorter hole he places the tobsecco, and applies his mouth to the other, and thus luxuristes to the fumes of the narcotic herh. There is, likewise, a specimes of the Singoo opium-pipe which is of very small dimeosions, the tube out being larger thoo a thimble. The opium is placed in the bowl, and ignited by placing a piece of charcoal on it, which is effected with a small pair of tweexers, which find a place in this interesting and well-arranged collection

The habit of smoking is very general in Chios, being common to both sexes in all classes of society, and at all ages. In every part of this vast empire the tobacco plant is cultivated, and consumed both as sauff and for smok-ing. So prevalent is the babit that little girls and boys are commonly seen smuking, and from this early period it is persevered in hy its votaries through life nlways customary to offer visitors a cup of ten and a pipe, M. Natalis Roudot estimates the number of smokers io China as at least 100 millions, and states that pipes are made in enormous numbers, and in an almost infinite variety of forms; they are of three classes, the woter-pipe, the straight-pipe, and the opinm-pipe. The Chinese pipes are generally very long, and the bowl very small, it being usually made of uickel-copper (white metal). The only contribution however is from Dr. Berncustle, who sends an optum-pipe and apportenances.

EGYPT.

The specimens in the Egyptian Court comprise two Narguiles or water-pipes, one of zinc and one much richer, mounted in silver; also several pipe-bowls of Assonam and Assiout.

FRANCE

The examples contain of the popins only from two examinations and the state of the

Person

Mr. J. B. Thomson (3, p. 1426) contributes a Narghili or Narguiké, and a lady's amber mouth-piece, and Mr. J. Hubson (10, p. 1427) several specimens of pipes, which illustrate the luxurious habits of the Persians in smoking.

SARDINIA

The contributions from this country consist of beantiful examples of carred mecrachann pipe-bowls, which equal those of Austria, but are insignificant in point of number, having been contributed by only one exhibitor.

TUBKEY.

In the Turkish collection are numerous rich examples of the Narguish; or success composed of the Narguish; or success composed of the Narguish; or success of the Subit to the Narguish; the content of a pipul to every with inchange of the Subit to the Narguish; the numerous of the pipul to the Narguish; the numerous of the longer of the longer of the longer pipul. 10 Holders of a Prize Medal.

18 Who obtained Honourable Mention.

18 Who obtained Honourable Mentic 21 Unrewarded,

The number of exhibitors from the various countries is as follows:—

LIST OF AWARDS

ALBA, SAMUEL, Vienna (Austria, 664, p. 1041).— Honourable Meation is accorded to this exhibitor, for a very large collection of meerschaum pipe-bowls, eigartubes, mad amber month-pieces. The plain bowls and cigar-tubes, and those ornamented with folinge are very creditable productions, but where human figures are introduced, they are not so well executed.

ATS-ATS. LEAS., Vienne (Austria, 666, p. 1641).— Prite Medal, for an assortance of most equivite specimens of meerchann pipe-howls and eigat-tubes; the scalpturing of the figures displaying remarkable artistic skill, and the execution of testage being bold and sharp. very moderate (10,843, 30s.; 11,028, 45.; rigar-stubwith figure of Venas, 45s.; number with that of Heredes, 50s.). Besides the above, the collection comprises acreat-0.31 and the state of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the state of the control of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the control of the control of

BEISDOYL, PHILIP, Vienna (Austria, 667, p. 1042).— Honourable Mention. For mecrehaum pipes with silver mounts and amber mouth-pieces; meerschaum pipe-bawls and cigar-tubes; cherry-tree and ebony pipe-tubes, and plain amber mouth-pieces, which are all very well manu-

and eigar-tubes; cherry-tree and ebony pipe-tubes, and plan amber month-pieces, which are all very well ananaplan amber month-pieces, which are all very well ananaments. Soss, and Ca., St. Omer, Pas-de-Calain (France, 176, p. 1813)—Infoomable Mention. For a great variety of clay-pipes, such as are used by the working classes, and more particularly by the peasantry. These pipes are more remarkable for their chesposes pipes are more remarkable for their chesposes.

Figure 1, 1987. Omer, Pas-de-Calais (France, 211, p. 1184).—Homorable Mention. For a large assortment of clay-pipes exceedingly well-made. The bowle are mostly in the form of heads, some intentionally grotesque, and others intended to represent eminent personages, scarcely less to, on account of the eyes being picked with two dals of black. These pipes are not remarkable for Prench.

Fig. 67. PLOGE, GERHARD, Vienna (Austria, 670, p. 1042).— Prize Medal. Carred mecrechaum pipe-bowla and cigartubes in great variety, and of excellent designs and exaction; also a large collection of amber for smoking purposes, including the round month-piece used in Turkey.

Fargater, Johans, Vienna (Austria, 671, p. 1042).

—Prize Medal. A very large assortment of merchaum pipe-bowls and eigar-tubes, with amber mouth-pieces of beautiful designs, frequently containing several figures, which are exquisitely and boddly sentptured. The prices, which vary from 17s. 6d. to 7l. 10s. each, are reasonable.

GRUNHUT, J., jun., Prague (Anstria, 673, p. 1042).— Honourable Mention is accorded for a mecrschaum pipebowl and two cigar-tubes, the carving of which is very shape and expirited.

p. 1132).—Honomable Mention. For remarkably shows day-pipes, varying in piter from 6.1 to 2s, per hindred. NATH EFFECHI, Contantinople (Turkey, 1441, 1447, 1469, 1969).—Pites Media fire a valuable collection of round amber month-pieces, for the chiboque or long pipe. Commanested with rings of artificial aventuries and with colour of the month-piece, the lowest being 378, 64, and the lighest 354, and also for a collection of justing pipes.

Pantscu, A., jun., Theresienfeld (Austria, 611, p. 1038).

—Honourable Mention. For an assortment of cheap clay-

pipe-bowls, coloured and glazed,
Romoli, Lurici, York Terrace, Chelsea (Tiscany, 124,
125, p. 1300).—Honourable Mention, For an ebouy pipetube, wrought in pierced carved work.
Roy. W. vov, Dantizi (Prassis, 441, p. 1075).—Honour-

Roy, W. vox, Dantise (Prussis, 441, p. 1075).—Honourable Mention, For a most interesting collection of all the known varieties of amber, systematically arranged in four cases, which contain likewase succinio seld, crude and pure, obtained from amber. Also for various manufactured articles, amongst which the most remarkable is an ranged to form a mosaic pattern, the Royal Arms of England being engraved in the centre.

Satu Aza, (Turkey, 3802, 3372, p. 1399). Honornible Mention, For an assortment of those maber mouth-piece which are in most general use in Turkey, and which vary a large collection of pipe-tubes, and wood month-piece. Stratzss, J., Turin (Sradisin, 80, p. 1895.—Piers Medal, For several elaboratoly-arred merechanum pipe-tubes, and the strategies of the

amber, among which are strings of well-formed spherical beads, a eigar-tabe, a ring-stand composed of different coloured ambers, the ornane at and workmanship of which are very good. This exhibitor has likewise sent a specimen of land amber, together with the fossil wood with which it is generally associated.

WINGENDER BROTHERS, Hochr (Nassu, 9, p. 1132).— Honourable Mention is accorded for an assortment of various descriptions of clay-pipes, intended chiefly for exportation, and which are remarkable for their low price, 5g, 6d, per thousand.

WINTERFELD, J.A., Bredan (Prantia, 204, p. 108).

—Prize Medal. For the largest collection of aubermannfactures, the workmanniy of which is exceedingly good: also a collection of most of the varieties of raw amber. The manufactures comprise amber mouth-pieces agree pipe-takes, composed entirely of amber; amber dange pipe-takes, composed entirely of amber; amber white opening manufactures and the control of the composition of th

Wönera E, H. (Hamburg, 89, p. 1139),—Honourable Mention. For a collection of well-made pipes mannfactured with Tarkish elay.

Zerras, Joseph Wienna (Austria, 687, p. 1042)— Prize Medal. Masca pipe-bowla and eigar-tubes, which are manufactured from meen-chann dust. The forms of these articles are elegant, and the execution so good that they are distinguished only with difficulty from the real mercubann. The price of massa pipe-bowls is much lawer than those of the real meen-chann, and they are smally mounted with plated instead of real silver tups.

VI. SNUFF-BOXES.

The boxs, which are known under this very general name, have exhibited equally the extremes of consesses and of elegance. Under the former condition, they will be remembered in the box of hors, beas, or japanned-tion—the last, however, being known rather as a common expensel for tobacce; and in the latter state, they will be recognised in the countless persible depositories for how the state of the state of the latter state, they will be recognised in the countless persible productions of nature have supplied the materials.

The word must is an infection of the old northern work must, and it existed as a term expensive of strong inhabit, and it existed as a term expensive of strong inhabits of the strong inhabits of the strong inhabits of the strong inhabits of the strong in

In the the naturable of which these bottles

In the extract already given from Howell's Letters, it is stated, that so early as 1646 even the peasants in Scotland were accustomed to "take out their boxes of suntchin, which exand draw it into their nostrils with a quill;" plains the intention of the spoon attached to the eruets referred to, the manufacture of which probably belongs to the early part of the seventeenth century. The word erroneously printed "smutchin" by Howell, is accurately mention, a vulgar name for stuff, which causes sneezing: and hence anceshin-mill (sometimes corrupted into most!) is the Scottish name for anuff-box. Dr. Jameson,* from whom these illustrations are derived, adds, that the word mill " is the vulgar name for a snuff-box, especially one of a cyliadrical form, or resembling an inverted cone. No other name, he continues, was formerly in use; and the reason assigned for it is, that when tobacco was first introduced into this country, those who wished to have sunff were accustomed to toast the tobacco-leaves before the fire, and then bruise them with a piece of wood in the box, which was thence called a mill, because the sunff was ground in it. From these notices it is easy to perwas ground in it. From Inese hotters it is easy to per-ceive how a ram's horn, from its conical shape, became one of the primitive forms of the Scotch sunfi-box; al-though at the present time it is frequently one of the most costly and Justrious. Down to the middle of the ciphteenth century, the "meeshin-born," with the spoon and hare's-foot attached to it by chains, appears to have been regarded as so completely a national characteristic, that when Baddeley played Gibhy in The Wooder, with Garrick and Mrs. Barry, he came on the stage with such an apparatus.

require that most of the known arts should be passed in review, as the greater number, not excepting even that of glass-making, have from time to time been subservient to the production. The discussion of these subjects is clearly "An Elymological Dictionary of the Sortish Language. † The Gulft, Horwbook, by T. Dekker; edited by the Rev. J. Nott, 1812, p. 119.

factore of the snuff-box in all its ramifications, would

beyond the province of the Reporters for Class XXIX., the Jurors for which were called upon to judge of such auuff-boxes only as are composed of papier-mache, wood, ivory, tortoise-shell, or horn: those made of glass and the various metals belonging to other Classes. Notwithstanding this limitation, the Reporters have endeavoured to ascertain the number of exhibitors who have contributed snuff-boxes in other Classes; but there may be some examples which have escaped their observation.

The manufacture of papier-maché snuff-boxes does not call for any special notice in this place; for although aus can sor any special notice in this passe; for allhough it forms a distinct frament of paper-maché work, its various processes scarcely differ in their details from those universally employed in the making of other articles. It may be remarked that the production of south-forces of this material is chiefly earried on in Oermany and France, whence they are exported to most

parts of the civilised world.

The manufacture of those very beautiful articles, called Scotch boxes, is the only one calling for especial notice in the present Report. These ingenions productions were originally made in the village of Laureneekirk, hy Mr. Stiven," whose son and successor is present by his works in the Great Exhibition. The art, however, suppears soon to have spread to other parts of Scolland; for we are informed that in 1832, in the parish of Old Camusck in Ayrshire, upwards of a hundred persons, comprising men, women, and children, were employed in the practice of it, and in 1845 there was also an extensive manufactory of wooden snuff-boxes in the town of Mauchline.† In this work, about sixty persons were at that period employed. Judging only by the importance of the contributions to the Great Exhibition from Laurencekirk and Mauchline, it might be inferred that the latter town is st present the principal seat of the manufacture of Scotch wares; which now includes the production of numerous other articles beside snuff-

In Classes XVII. and XXIX, are examples of covers fur books and memorandum-books; paper-knives and book-markers; eard-cases and card-trays; spectacle-cases; needle-books, thread-reels, erochet-cases, knitting-cases and work-boxes; razor-cases, sheaths for razor-strops, pomatum-boxes, scent-boxes and dressing-cases; eggcups, ten-caddies; and even candlesticks. To give an idea of the wholesale prices of some of these articles, the following quotations are eited:-Cigar-cases are sold at 42s, per dozen; paper-knives from 10s, to 17s, per dozen, according to size; snuff-boxes from 22s, to 168s, per dozen; and netting-cases at from fe, per dozen

The Scotch Sautt-box, which has long been renowned for the perfection of its binge and the close fitting of the eover, is cut out of the solid wood, the description chiefly employed being the symmore or plane-tree. Mr. W. Chumbers states that this is the timber used at Old Cumuock; and that a piece of rough wood which costs 25s, will make snuff-boxes to the value of 3,000/. first operation consists in making a number of circular exeavations in close contiguity to each other, by means of a centre-bit, or a drill running in a lathe; the interior is then squared out by means of goages and chisch, and is afterwards smoothed with files and glass-paper. The celebrated hinge is formed parily out of the substance of the hox and parily out of that of the lid, the greatest attention being paid in its construction to the accurate fitting of the various parts one into the other. The box is lined in the inside with stout tin-foil, and is painted on the outside with several coats of colonr, each of which is rubbed down smooth with glass-paper before the succeed-ing coat is applied. It is then ready to receive the various styles of ornament, which, in some cases, are produced by the hand of the artist, and, in others, hy mechanical means. The most usual decoration consists of the mrtan-patterns, the component lines of which are drawn separately by pens fixed in a ruling-machine on to

the box itself, if bounded by planes or slightly-curved surfaces: although such lines were also formerly drawn by means of a rose-engine on circular boxes, it is now found a more convenient practice to rule the lines on paper, and then to attach the paper to the boxes Another style of ornamentation, known by the name of "Scoto-Russian," is of more recent introduction, and imitates, in a remote degree, the beautiful ensmelled silver snuff-boxes, for which Russia has long been famous, In these, the outside of the box is first covered with stout tin-foil, then completely painted all over the surface, and afterwards placed in the rating-machine, which traces upon it on intricate pattern of curved and straight lines, hy means of a sharp flot tool. This instrument pene-trates completely through the paint, but only scrapes the tin-foil, which is left very hright and resembles inhid silver. Several coats of copal varnish, each of which is successively polished down, are then applied to complete the south-box.

In the manufactory of the Messra Smith, of Manchine, which is said to be one of the largest, about eighty arti-saus are employed, who have been instructed in the works. The workmen carn from 16s, to 24s, per week, according to their skill and the department in which they are engaged; and the women from 7s. to 9s per week. An actist capable of making a copy of an oil pointing earns 30s, per week.

AUSTRIA.

There are two exhibitors of snuff-boxes in the Austrian Section, one of whom, P. Buaaalla, (t/60), has contributed some beautiful specimens composed of a sparkling glass, called Artificial Aventurine; which is a silicate of oxide of copper, wherein part of the oxide of copper has been reduced to the metallic state by processes which are kept secret. The reduced copper exists in the form of minute erystols, which, under the micro-scope, present a most splendid appearance. Although mention is here made of these articles, they really belong to Class XXIV. The other exhibitor has sent examples of nanier-maché snuff-boxes, glove-boxes, work-boxes, cigar-boxes, spice-boxes, and buttons, which are creditable productions of their class, and remarkable for their cheappess,

CHINA.

In the Chinese Court there is a beautifully carved sourf-box, sculptured out of English cannel-coal, which was taken to China for that purpose by the exhibitor, Captain NHA, p. 1420. The carving, which it appears occupied the Chinese arriva is fortisight, cost the eXhibitor only 2l, sterling. This specimen, however, does not strictly belong to Class XXIX, nor does it represent the smuff-box used by the Chinese. The snuff-box, or rather suuff-flask of Chinn, is in form and size like a smellingsount-mask of (Linna, is in rorm and size mac a succining-buttle, and is made of rock-crystal, coloured gisses, por-celain, wood, and other materiels. To the stopper is strached a small spatula, for the purpose of taking out the snuff, a contrivance which has already been described as formerly in use in England.

BAVARIA

The contributions from Bavaria, sent by two exhibitors, consist of papier-maché small-wares, including snuff-boxes, which are produced at remarkably low prices, and are exported in very considerable quantities,

BRITISH COLONIES. The Indian Courts contain several examples of snuffboxes, the most earnous being - the goard small boxes, mounted in gold and silver, from Scinde; a snuff-box

mounted in gota and adver, from Seinde; a smift-hox made from a econs-sut, highly polished; another from the bilva fruit; and a beautiful specimen made of huffalo-horn inlaid with metal (p. 920). St. Helma con-tributes smift-boxes made from the willow-tree inder which the remains of the great Napoleon reposed until their removal to France and also removed until their removal to France, and also from a willow-tree which he planted behind the library at Longwood. From Von Diessen's Land, J. Million (201-203, p. 996) exhibits several specimens, interesting from the variety

The New Statistical Account of Scotland, Vol. XI. p. 144.

 p. 175.

[#] Gazetteer of Scotland, p 175.

of the materials of which they are made; comprising a globular snuff-box turned ont of the tooth of the spermwhale, which is employed in the colony for stick-heads and similar purposes; a turned snuff-box of irou-wood (Olea apetala); one of the huron-pine; and one of the musk-wood of Tasmanin (Eurebia argophyllum).

FRANCE.

The beautiful examples of sunff-boxes in the French Department are as peculiar in their style as the Laurencekirk snuff-boxes in their's, and the manufacture of them appears to be confined to France, if not to Paris. These boxes, which are quite remarkable for the accuracy with which the hinge is made, and the close fittings of the lid, are usually lined with a vencer of tortoiseshell very highly polished. The outside or body of the box is composed of various materials, as ivory, tortoiseshell, and rhinoceros-horn, and also of petrified wood and other woods, as the maple, the olive, rosewood, and several sorts of palms out across the grain. Some examples are very tastefully, not showily, ornamented with neat gold and silver mounts, but none, perhaps, are more elegant than those made of the palm-tree cut across the grain. These contributions are from two manufacturers, in the excellence of whose work only a very trifling difference was discernible.

GRAND DUCKY OF HESSE.

The examples from Hesse consist of papier-mache snnff-boxes, very similar in character to, but not so numerous or various as those of Austria and Bavaria. They were sent by one exhibitor (61), who has been rewarded for walking-sticks, and is mentioned in the section relating to them in the present Report.

The snuff-boxes and other articles of small wares sent from Prussia are also entirely of papier-maché, and are principally imitations of the various descriptions of Scotch, of tortoiseshell, and Russian boxes. They deserve com-mendation for the workmanship, but they are higher in price than similar goods sent from Austria and Bavaria. The following are some of the prices which were quoted as those at which the goods are sold wholesale; but judging from the examples from other parts of Germany, junging from the examples from the prices:—Souff-boxes, plain, 15s. per dox; marbled boxes, 15s, per dox; dox; dsmasked, or engine-turned boxes, similar to the "Scoto-Russian," 15s. per dox.

Reventa.

The contribution from Russia is the produce of one manufacturer, and consists of papier-maché snuff-boxes, creditably made, but exceedingly high in price. The most common snuff-boxes sell at 2s. 10d,, and the dearest at 38s, each: and the cigar-boxes range from 22s, 2d, to In 1842 the government of Moscow possessed five manufactories of papier-maché snuff-boxes, which employed eighty workpeople, and produced goods valued at 3,000/.

From Saxony there is also a contribution of papiermaché sauff-boxes, ranging in price from 1s, 10d, each to 2s. 6d., the latter being an imitation of the Scotch box, There are likewise some boxes of buffalo-horn, lined with tortoiseshell, all which productions are commendable for their finish.

TUBREY.

The snuff-boxes in the Turkish Court consist of three examples: One of the bituminous-hale, a well-carved mother-of-pearl souff-box from Bethlehem, and a box made of enamelled silver, the latter of which does not, however, belong to this Class.

UNITED KINGDOM.

Class XXIX., the exhibitors of snuff-boxes are only four in number, and those deserving of especial mention are contributors of Scotch snuff-boxes. The most important display is that to be hereafter noticed in the list of The other principal collections are that of Mesers, Clarke and Davidson (p. 545), of Class XVII., No. 135, and that of Mr. Stiven (Class XXIX., 35, p. 79), which are both deserving of favourable notice,

The snnff-boxes from Wurtemburg are of two kinds, and were contributed by two exhibitors. One of them has sent papier-maché snuff-boxes inlaid with mother-ofpearl and imitation gold and silver, which are very commendable as of the better description of papier-maché work; and the second has supplied some carved ivory snuff-boxes inlaid with mother-of-pearl, which are also deserving of praise.

The number of exhibitors of all nations in this division is twenty-one; of these, there are:-

- 5 Holders of a Prize Medal. 16 Unrewarded.

LIST OF AWARDS. ADT BROTHERS, Eusheim (Bavaria, 66, p. 1101), Prixe Medal, for an assortment of very cheap papier-maché small wares, comprising cigar-boxes, glove-boxes, cigar-cases, snuff-boxes, and memorandum-book-covers, which are well manufactured; and although artistic merit is not aimed at, the less elaborate are creditably orna-

mented COLETTA-LEFEBVRE, Paris (France, 458, p. 1200), Prize Medal, for beautifully-finished snuff-boxes, made of wood or ivory, and lined with tortoiseshell, and remarkable for

or vory, and inset with forcestedell, and remarkance for the close fitting of the hinge and joint. Horatturas, C., Reicheman (Anstria, 644, p. 1040), Prize Medal, for a very large assortment of Papier-maché sunif-boxes and other popier-maché small-wares, comprising 167 varieties, which, taking the price into consideration, are remarkable for their cheapness and goodness of manufacture. As an example of cheapness may be cited the imitation Scotch snuff-boxes, which

may be cited the imitation scored shutt-wave, when wary in price from 4d. to 7d. each,
Mencius, C. V., Paris (France, 1658, p. 1256), Prise
Medal, for tortoiseshell, palm-tree lined with tortoiseshell, and other kinds of smift-boxes, in all of which the workmanship is most excellent; the accuracy of the hinge, and the close fitting of the joint being points particularly commendable.

SNITH, WILLIAM and ANDERW, Mauchline, Ayrshire, Scotland (Class XXIX., 280, p. 816), Prize Medal, for a great variety of articles ornamented with Tartan patterns, engine-turned patterns ("Scoto-Russian"), and paintings, Independently of the manufacturers who sent the engine-turned patterns ("Scoto-Russian"), and paintings, ram's head mull, before alinded to as not belonging to and comprising sauf-boxes, hiotting-cases, cyar-cases and several other descriptions of Scotch small-wares, which are remarkable for the great accuracy of the workmanship, high degree of finish, and the heauty of the varnish.

E. MANUFACTURES RELATING TO AMUSE-

I, MANLY GAMES.

Cricket and Arehery are the only games of skill and strength which are represented to an extent worthy of notice.

Cricket. UNITED KINGDOM.

The exhibitors of bats and other implements used in

cricket are nine in nomber, and, as might be expected, they are all British; indeed the articles they contribute are scarcely intelligible to any but Englishmen. The implements and appliances in the nature of gloves,

guards, &c., which the present mode of playing the game, and especially the practice of swift overhand bowling, has brought into use are so various, that there is more room for ingenuity in the manufacture of them than might at

for toperative the season of t lighter than those which are thickly waided or lined with Indian rubber, whilst they farnish a stiffer and more effectual defence against the ball.

So also in regard to the gloves which protect the fingers of the band that holds the bat; by a tube of Indian rubber fixed along the buck of each finger, an improvement is apparent in those enhibited by Messrs. Dark and Sons, inasmuch as a second and smaller tube is fixed within the first, thereby materially increasing the resistance to a hlow from the ball without sensibly adding to the weight or diminishing the pliancy of the glove. The bate schibited by R. Dank (198) are of excellent wood and very well balanced.

DUKE and Son (191, p. 800), contributed a collection of all the implements used in cricket, remarkable for the The number of exhibitors is oine; of these, there are

DARK, MATILDA, and Soxs, Lord's Cricket Ground (Class XXIX., 197, p. 800), Prize Medal for a collection of bats and wickets.

DARK, ROBERT, Lord's Cricket Ground (Class XXIX 198, p. 801), Prize Mcdal for gauntlets, leg-guards, spiked-soles, balls, and other implements, used in the game of

DUKE and Sox, Penshurst (Class XXIX., 191, p. 800), Prize Medal for implements used in the game of cricket.

Archery

UNITED KINDDOM.

In archery the British exhibitors are five in number. P. MUR and AINCE and ALDRED exhibit articles of excellent workmanship. The bows are well halanced, excellent workmanship. The bows are wen nanneca, and the materials from which they are made well se-lected, some of the woods being of great value and arrity. A bow of Spanish yew, exhibited by the last-named firm, is valued by them at 35 guiness. The arrows also of both exhibitors are beautiful specimens of intaid wood.

BRITISH COLONIES.

There are several contributions of bows and arrows from the dependencies of Great Britain, but as they are the only distinction between their work appears in be in really used as weapons, they do not belong to Class the amount and character of the ornaments attached to

XXIX. The reader is, however, referred to the follow-ing: - British Guiana (144, 145, and 145A); the Indian Court, which contains specimens of bows and arrows from Assam; bows and arrows from South Africa; and several contributions from Western Africa.

SWITZERLAND

One exhibitor sends a variety of bows; and a case of arrows remarkable chiefly for the number of separate pieces of wood of which they are framed. One arrow is stated to be composed of no less than a thousand

The classification according to the various countries is as follows:-Switzerland

AINDE and ALDRED, 126 Oxford Street (Class XXIX., 180), Prize Medal for bows, arrows, and archery-accoutre-

ents, and also for fishing-tackle. Muta, P., Edinburgh (Class PXIX., 150, p. 798), Prize Medal for bows, arrows, and archery-implements.

Rockets

UNITED KINDDOM.

A small selection of Rackets is contributed by one exhihitor to Class XXIX. The manufacture of these, especially of the heavier and stronger, such as are used in the game of tennis, is hetter understood in France than in England; indeed the rackets used in the few tennis-courts which still exist in England are mostly im-

ported from France. AWARD. JEFFERIES, ISAAC, Woolwich (Class XXIX., 184, p. 800), Hononrable Mentinn for a selection of rackets which

deserve to be mentioned as promising to compete successfully with those of French manufacture.

II. FISHING-TACKLE. University Kingson

The articles exhibited under this head are, as might be

expected, almost entirely of British manufacture, the sport of angling being but little pursued in other countries, and nowhere with the same study and scien-tific skill as in the United Kingdom, Probably there is no other country in which the manufacturers of fishing-tackle constitute a trade in themselves, certainly none in which so much money is annually spent upon the implements which they produce. The British exhibitors twenty-five in number.

The merits of many of their articles, especially of the rods, could not be completely tested within the limits of the Exhibition. The most valuable properties of a rod consisting in the thorough seasoning of the wood, its capability to resist weather and wear, without warping or twisting, and its retention of an even spring and pliability under constant use, can be ascertained only after prolonged trial; a test which it has not been in the power of the Jurors to apply. The same may, to a great extent, be said of lines, artificial flies, and baits, the dara-

hility of which, one of their most valuable and rarest mitty of writen, one of tents most valuatine and rarest merits, must be proved by experience.

The articles exhibited by C. Fanzlow (176, p. 800), Alvor and Aldren (180, p. 800), J. K. Panlow (181, p. 800), and Jahrst Jowes (181, p. 800), may all claim much credit for execution and high finish. In this respect

But it should be observed that a profuse expenditure of silver and gilding in the meml-work of a fishing-rod, the application of precious stones in the reels and joints, the inlaying of the huts with ivory and rare woods, and the use of velvet or silk, embussed and gilt, in the place nf leather or other more appropriate materials, of which the books and cases for containing fishing-tackle are more usually and properly made, cannot be considered as im-

LITTLE and Co. (174, p. 800), exhibit some improvements which combine practical utility with excellent work-manship. A multiplying reel, in which, hy an ingenious arrangement of the cog wheels (the teeth of the driving-wheel being internal), the handle of the reel retains its place in the centre instead of being fixed, as is usually the case in multiplying reels, at the edge of the side plate, thereby being more convenient to wind, and less liable to entaugle the loose line. Also an application of sliding rings to the nater ferrales of the joints, which are slightly split, and, by the pressure of the rings, made to gripe the inserted joint more closely, whilst the inconvesieuce of the joints becoming fixed when swollen by wet, is obviated. Also a mode of forming and fixing the ferrule on the joints, whereby the modden transition from plant would to stiff metal, which renders a rod, when strained, mpt to give way in those parts, is in great measurements. sure avaided

AINGE and ALDRED (180, p. 800) exhibit some spliced rods of excellent construction, each joint being composed of three pieces, bound together longitudinally, and thereby less liable to twist or warp, whilst it retains an even

spring and elasticity throughout.

J. BERNARD (177, p. 800) and J. K. FARLOW (181, p. 800) exhibit articles of considerable merit. Rods of similar construction to those last mentioned, and an improvement in the construction of ferrales; the lower and larger joints being fitted into the upper, instead of the upper into the lower. This mode has the advantage that water is less likely to find its way between the joints and make them swell.

FRANCE

With the exception of some lines for float-fishing, of very fine and even texture, which are exhibited in the Department of France (141), there is no contribution from foreign manufacturers.

The number of exhibitors is twenty-six; of these, there are-

2 Holders of a Prize Medal, 4 Who obtained Honourable Mention,] 20 Unrewarded,

The classification, according to the varians countries, is as follows :-

III. TOYS.

One of the most eminent of modern physicists* has remarked that "boys' toys are the most philosophical things in the world," and a renowned statesman, taking another view of their importance, affirms that they are an index to the character of a nation.

In illustration of the first position, a few examples may be cited. A child's kite, in the hands of a Franklin and a Romas, has served to identify lightning with electricity; and conveys an instructive lesson on the composition of mechanical forces. The pea-shooter not only affords evidence of the elastic force of gases, but also of their economical employment when used expansively. The sucker illustrates the weight of the atmosphere, and its equal pressure in all directions; and the sling, the hoep, and the top show the property of centrifugal-firre; when the top is in rapid motion, it converts for the mument, every spot and hruise on its surface into an relegant zone; and thus also imparts a good lesson in physiological optics. To a reflecting mind toys affired ample food for thought; and they might, perhaps, be made to yield much salid instruction to the child, were it not generally far more wise, for a certain period, at least, to limit its inquiries rather to the discovery of the weakest

parts of its plaything.

With regard to the assertion that toys indicate the genius of a nation, it is evident that, as the natural tendency of children is to imitate the employments of their elders, they will always take the most interest in such toys us will assist them in this propensity, and lead them in their sports to do that which they see those around them doing in earnest. Hence, in countries which are of a military disposition, flags, drums, trumpets, gnns, swords, and the accontrements of soldiers, are much in demand for the pastime of even the youngest boys. In a maritime nation toy-ships will be esteemed; and thus the very pastimes of childhood might be made available in promoting the welfare of such services as the partienlar state most requires. The Exhibition might, therefore, have afforded an in-

teresting opportunity to statesmen and philanthropists for studying the diversity of character exemplified by the contributing nations, had they been all as well represented in their toys as they were in their rather manufactures. This, however, was far from being the case, as will be seen from the subsequent detailed Report,

The only contributions from the United States consisted of India-rubber toys, which belong to Class XXVIII.

AUSTRIA.

The toy-trade of Austria is exceedingly well and very pionsly represented in the Great Exhibition. From Vicuus there are two exhibitors, one of whom sends a great variety of automaton-toys; and the other a general collection of ordinary toys, military-accontrements, guus, and swords, holding a very prominent position among them. From Bohemia are sent excellent and very numerous examples of those very beautiful boxes of toys far which it is famous, and which form a large item in the export-trade of the country. From the mountains of Tyrol, J. B. Ponora (655, p. 1041), contributes unmerous specimens of carved white wood toys, which are deserving of favourable mention, both on account of their cheapness and the goodness of the workmanship. The specimens supplied by the other three exhibitors will be found noticed in the List of Awards.

BAVARIA.

The chief contributions from Bayaria consist of mechanical toys, which will be noticed in the List of Awards; and also of numerous magnetic toys, exhibited by J. M. INMAYER (26, p. 1099) which are deserving of com-mendation for their ingenuity and variety. Both collections are from Nürnberg, in which city large quantities

. Dr. Michael Faraday. † Mr. Richard Cubden. of these descriptions of toys are made for exportation. Besides the exhibitors of the foregoing specimens are two others, one of whom sends dressed dolls, and the other carved toys, which do not call for any particular

FRANCE.

One of the French Exhibitors sends two ingenious drowing-room ornaments, containing automaton hirds, which are toys rather for adults than children. Another exhibitor contributes some excellent wax-figures for hairdressers, which are made hy processes similar to those employed for producing the best description of dolls; and they are, therefore, enumerated with toys. But although France manufactures enormous quantities of toys of many kinds, only one description of them has been sent, and that by a single exhibitor from Paris, who been sent, and that by a single exhibits dressed dolls only. "In that capital alone," according to the Statistique de l'Industrie à Paris, says M. Natalis Rondot, "there were, in 1847, no less than 371 manufacturers of children's toys, employing 2,099 workpeople (641 men, 1,345 women, 80 boys, 33 girls). workpeople (1-41 men, 1,342 women, 30 opt), 33 girts), who, in that year, produced 172,800, worth of goods." The men earn, on the average, 2s. 8d. per day, and the women is. 3½d. per day; but some of the men earn 2s. 3½d., 3s. 3½d., 4s. 9½d., according to their skill, or the description of work they are employed on. Many of the masters employ only a single assistant, or work alone, and very few employ more than ten assistants. Thus, of the 371 manufacturers only 52 employed more than 10; 142 employed from 2 to 10; 77 employed 1; and 90 employed no assistant, but did all the work with their own hands. Competition has, it appears, brought down prices so low, that dressed-dolls, incloding a bonnet, are to be bought for cight pence per dozen; and undressed composition dolls at two-pence half-penny per dozen. It is to be regretted that none of the very excellent automaton toys, boxes of games, of kitchen ntensils, &c., find a place in the French Department, as they are exported from France to a considerable extent. Swords, guns, helmets, and other military accourrements, are also, as might be expected, produced in large quantities in that country; hat are disposed of chiefly for the home trade, Most of the toy-guns are beautifully made, and are generally furnished with percussion locks, which will fire off a cap. Conjuring-toys, for adults as well as children, ought most certainly to have been exhibited, as in the manufacture of these articles Paris has no rival. The nature of the toy-trade in Paris is thus given by M. Natalis Rondot :-

Number Masters.	Number of Work- people amployed,	Nature of Goods sunnufactured.	Value.

FRANKFORT. J. V. ALBERT (p. 1122) exhibits, amongst philosophical

apparatus, Dolls and the Moor's-head conjuring-toy, which admits of a knife traversing the neck without severing the head. The mechanism by which this is effected, though simple, could not be made clear without a diagram.

Намиско.

The only contribution consists of Heads for dolls made of papier-maché and wax, which call for no comment farther than that they are largely exported to England and other countries.

PRUSSIA.

The principal Toys in the Pressian Department are those of Pewier Foun Berlin, which are solicide in the List of Awards. Pesides these there are positores of most and the properties of the properties of the same of the properties of the properties of the amenit six of these submiss (No. 253). A. Ellisterieckhildric of Class XXIX, No. 198, p. 277), ends a "Bellamonois-chandelite." This very humorous prowide the properties of the properties of the with the performer of his band seater bound the circles of the candelshrum, in a great variety of quaint and expressive astimptics; their features and varied action

SAXONY.

The contribution consists of a few Toys and husts made in pewter. Yet in 1846 there were six hundred and ninety-seven manufactories of wooden toys, which employed fifteen hundred and twenty workpeople.

SWITZERLAND.

There are not any carred white-wood toys exhibited in the Swiss Department, excepting some beautiful small models of oringes, who will call any of the control of the contr

[•] It would appear from the admired Indian drama of Secondade, without pile poet Collada in the first century B.C., that this has of the poet Collada. In the first century B.C., that this has of the poet Collada in the Collada B.C. "Go, I prox," says an attendant, in Act Vil., "to my cottage, where thou with find a plaything made for the hermit's shill Sencera: it is a pracease of carthen-ware, pationed with rich colours."— Works of Sor William Joses, vol. vi. p. 302.

When it is magnified about twenty times linear, all the various parts may be distinctly seen, and they then appear beautifully formed and perfect in their polish. Every part is, indeed, as complete and perfect as it is to be found in an ordinary precussion-pistol, so that the lock cases when the ringger is pulled. The second contribution is a Mechanical singing-bird from another Exhibitor, and will be found noticed in the List of Awards.

UNITED KINGDOM. Although the number of Exhibitors of toys in Classes XXIX, and XXX,, whose contributions have been examined by this Jury, is Twenty-noe; yet, as the greater part of their productions consists of large models and other special objects, the United Kingdom is scarcely represented in Toys properly so called. Even of Wax-dolls, which are made in this country in considerable numbers, there is only one contribution (Class XXIX., No. 123, p. 797) worthy of notice; and this will be found described in worthy of notice; and this will be found descrined in the List of Awards. Rocking-horses are exhibited by J. C. Dran (Class XXIX., No. 128, p. 797); and H. Lacas (No. 127, p. 797) sends an improvement on the Garden-hierse, which is made to rock by means of the motion of one which is made to rock by means of the motion of one of the wheel-axes as the horse is dragged along. A few Compressible-toys are exhibited (No. 216, p. 801); and a variety of Automaton and other toys, elicily foreign, are displayed by A. Borener (No. 124, p. 797). With respect to the models already referred to, those exhibited at (No. 126, p. 797), will be noticed in the List of Awards. The others, which are worthy of favourable mention, are: — a landscape, with elockwork giving mation to a railway train, &c., contributed by J. T. Curm (Class XXX., No. 146, p. 829); another mechanical land-scape-picture, by J. L. Barrett (Class XXX., No. 339, p. 842); and the model of an English villa (Class XXX., Nn. 213, p. 832), exhibited by M. A. SRITH. None of the ordinary strong toys of English manufacture are contributed, probably on account of the makers of these sorts being generally very poor. For most of the English wooden-toys are constructed by chamber-masters, who seldom manufacture goods to order; but, on the contrary, when they have produced a small number, hawk them about from shop to slop, or vend them in the streets, Without capital, and compelled to work almost literally from hand to mouth, they continue to exist only, without any material advance, but making much the same kinds having the same general degree of merit one year after another. That this is no exaggeration, must be conceded by every one who will recall to mind the toys of twenty years since, and mentally contrast them with those of the present day. That the progress has been slow, and requires long intervals for comparison to make it apparent, quires long intervals for comparison to make it apparent, arises from the fact that all the improvements must be made in the few lessure moments of the workmen, who are compelled to labour many hours each day to gain a livelihood, and who, probably, cannot even afford the time to carry out any suggestions which may be made to them That the poor workman does, nevertheless, endeavour to Inst the poor workman does, betermiests, eisdelvour to improve in his productions, is shown by Mr. Dickens, with touching humour, in *The Cricket on the Hearth*, when Caleh is made to asy, "You couldn't have the goodness to let use pinch Boxer's tall, numn, for hard a nument, could you?" When surprise is expressed at the question, he time explains his meaning: "Oh, never numl, numn! be mightn't like it, perhaps. There's a small order just come in for barking-dogs; and I should wish to go as close to natur' as I could, for sixpence. That's all. Never mind, mnm." Dolls'-houses, shops, brewers drays, waggons, common horses, the body formed of a sort of skittle with a slice cut off on the under side, and four round pins for the legs, are made in large quantities in England. Spades, wheelbarrows, garden-rollers, garden-rakes, skipping-ropes, caoutchoue-balls, topa, kites, and similar toys, are also made in great numbers. or composition dolls are made entirely in England, but wooden-dolls are imported, as are also papier-maché dolls'-heads, the bodies only being made in this country.

That very large quantities of boys' Marbles are also annually imported, we learn from the Hull collection (No. 290, pp. 816, 817), in reference to which it is stated, that 1,600 cwt. of these articles were entered at that port during the year 1850.

As toys are among those foreign productions which come under the enterproy of "Goods Non-enumented," the Reporters are unable to give a detailed account of the various kinds which are brought into Eugland, but the following list will show the extent of this trade, with respect to the various countries which send their toys believe. The Hamescuit Towns, it must be remembered, believe. The state of the parts of Germany.

KIETAIOL, F., Vienna (Austria, No. 653, p. 1041). Prize Mild for a collection of Thirty-aine Automaton-toys, These toys, which are all mored by good metallic clockwork, are most iogenious productions, but they appear to be more expensive than similar manufactures produced in France, with which, nufortanately, the Exhibition afforded no opportunity of comparison. The following

are among those descring of especial notice:—Male and female figures sulting, 12a, the contrivance for effecting the occasional rapid rotation of the German waltz being very ingenious; i Planiste, (31a) who plays, or rather appears to play, "God save the Queeu," and "Rud Brittania;" an Elepante carrying a Howdab, and four walking Indians carrying a Palanquin. This collection is the only one of detached becometive-figures.

MONTANARI, AUGUSTA, Upper Charlotte Street, Fitzroy Square (Class XXIX., No. 122, p. 797), Prize Medal, The display of this Exhibitor is the most remarkable and beautiful collection of Toys in the Great Exhibition. It consists of a series of Dolls, representing all ages, from lofancy to womanhood, arranged in several family groups, with suitable and elegant model-furniture. These dolls have the hair, eye-lashes, and eye-lids separately inserted in the wax, and are, in other respects, modelled with life-like truthfulness. Much skill is also evinced in the variety of expression which is given to these figures in regard of the ages and stations which they are intended to represent. From the prices of these dolls, however, they are adapted rather for the children of the wealthy then for general sale; since the prices of the undressed-dolls are from 10s. to 105s. each; the dressed-dolls, which are attired with much taste, are much more expensive, and vary in price according to the richness of the material of which the robes are made. In a small case adjoining that which contains the toys just ennmerated, are displayed several Rag-dolls, which are very remarkable productions, considering the materials of which they are made. They consist entirely of textile-fabrics, and the dolls which are intended, and are well adapted for the nursery, are reasonable in price, varying from 6s. 6d. to 50s, per doll, including the dresses.

Prize Medial, for a collection of Pewter-toys; the principal example being a representation of the review at Window, on the occusion of the visit to England of the Emperor which this well-exceeded model contains. Besides this specimen, there are several miniature Dianer and Tes services, also can it powter.

services, also dail to per life. Street (Class XXIX., No. 126, p. 175). Pitts Medal, for two Models, one repositing to English farm-yard, and the other Guilliver to Lilliput. The Farm-yard is no lapsenions model, representing with fidelity the various buildings and the every-needing with fidelity the various buildings and the every-purpling of water for extile, thanhaling of comp by horse-power, winnowing of grains, &c.; the various figures being mored by clock-work.

The second model was executed by A. Fleischmann,

of Sonnenberg, who also exhibits a comic chandelier in stacks, do not belong to this Class, and were, therefore, wakes in the country of Lilliput, and finds himself "unable to stir," "As I happened," he continues, "to lic ou my back, I found my arms and legs were strongly fastened on each side to the ground, and my hair, which was long and thick, tied down in the same manner. I bkewise felt several slender ligatures across my body, from my arm-pits to my thighs," Such an iacideot affords ample scope for the imagination of the artist, and he has proved himself quite equal to the undertaking. There is much humour evinced in the physiognomy and expression and action of the Lillipations, some of whom are bold enough to pash their inquiries so far as to pry are some enough to pass their inquiries so har as to pry into Gulliver's waistonat-pockets, a piece of temerity which is nigh coating one philosopher-looking individual his life. Others of the unkives, however, are far more cautious, and mounted, in funcied security, upon the becauches af trees which Gulliver night blow dawn with a breath, they content themselves with a more distant view of him; others again prefer trusting to the ground and their own legs, and some of them are already on the start at the first sigus of waking on the part of the manmonster; some slow, dull-headed individuals, not knowing what is taking place, are eagerly climbing up on his body, whilst others are precipitately sliding down; and even the Lilliputian horses seem to have their presentiment of danger, and are becoming unmanageable.
Wittien, Kennel, and Co., Geisslingen Wurtemburg,

No. 52, p. 1119), Prize Medal, for upwards of two handred Boue and Ivory small-wares. The chief part of this collection consists of very small and exquisite Models of furniture, in which there is much minute pierving and carving which, in this respect, exhibit great skill on the part of the workman: these miniature works are much used as chimney-ornaments in Germany. There are also numerous children's Toys; as, rattles, 64d, each; spelicans, 2s. the set, in which those with figures are fairly carved, considering the nature of the goods and their prices. Umbrella and stick-handles form also an item of these productions, and present several examples of good carving, as, for instance, one representing bears climbing a pole, valued at 22s. Lastly, there are several small articles, such as ladies' brooches, and ladies' companions ur cases, containing bodkins, crochet-needles, &c., which are sold for is, each. The whole of the productions are well manufactured, and reasonable in price.

F .- MISCELLANEOUS.

In addition to the various manufactures already noticed in the previous remarks, there are productions from no less than Eighty Exhibitors, of so miscellaneous a character that they do oot admit of being classified under racter that they do not admit of being etassisted under any one of the numerous subdivisions already specified. Of these, however, it must be remarked that braid, sewing-cotton, felt, wire-buttons, bone buttons, pins, uccilies, fish-hooks, printers' type-cases, black-lend pencils, large flating-inchke (including large unets), easks and models of vats, shocmaker's-lasts, gig-whips, hot-water and steam-apparatus, assh-line, sheets of woven-wool, cotton and worsted bobbins, and the covering for

London, March 1852.

the Praising Department. It represents one of the inei- not examined by this Jury. Of these various manofac-dents in Swift's well-known romance, when Gulliver tures there are Tweaty-one exhibitors, leaving still Fiftytures there see Twenty-one exhibitors, leaving still Fiftynine belonging to the present Class XXIX, there are:-

The contributions of these Exhibitors were carefully xamiued, but no Awards were made in their favour. The following, in Class XXIX., are nevertheless worthy of notice.

Burnishing-Stones.

T. CHAMBERLAIN (231, p. 802) exhibits specimens of Burnishing-stones for the use of silversmiths, of which both the rough and the finished stones are displayed.

Confectioners' Moulds. LEALE and ALBRECHT (108, p. 796) exhibit several

well-made jelly and cake moulds.

Letters for Sticking on Glass and Door-Plates.

H. FLETCHER (240, p. 802) exhibits Letters to be fixed on glass; and, also, Engraved door-plates filled with a composition said not to be liable to erack in the san, a very valuable improvement which, buwever, can be only tested by time. G. Lucas (277, p. 816) exhibits brass and zinn door-

plates engraved by machinery, and also filled with a com-position said to be not liable to crack in the snn, nor to position said to be not made at be acted upon by the atmosphere.

Glass and Emery Paper, and Cloth. BARSHAM, Son, and Co. (213, p. 801), and R. and

II. Romers (215, p. 801), exhibit excellent specimens of Glass and Emery cloth, and glass and emery paper; and also of the powdered glass and emery of different degrees of fineness, which are used in their manufacture.

Ornamental Paper-Work.

There are several examples of Cut-paper urnaments both in Class XXIX. and Class XXX. The only contribution, huwever, which need be noticed, is a very beautiful Paper Transparency, representing Chepstow Cattle, Moa-mouthshire, by moonlight, which is exhibited by S. Hrs. near (Class XXIX., 301, p. 817). The effect, which resembles very closely that of the porcelain pictures, is produced by many over-laying sheets of tissue-paper, cut out in the proper form with scissors, a work requiring much patience as well as skill.

Wafers,

H. THUNDSON (209, p. 801) exhibits very beautiful specimens of Cameo-wafers, a manufacture, to a great extent, superseded by the very general employment of envelopes having their seal-flaps gummed and emboased, The remaining contributions are too unimportant to require enumeration in this Report, especially as they are amply described in the *Illustrated Catalogue*.

CLASS XXX.

REPORT ON SCULPTURE, MODELS, AND PLASTIC ART,

(The Figures after the Names (between parentheses) refer to the Exhibitors' Numbers and lo the Pares in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE, I

Jury.

RICHARD REDGRAYF, R.A., 18 Hyde Park Gate South, Kensington Gore; Artist. Y. D. C. Ser DROMF, Holland; lats Master of the Mint at Utrecht. Dr. C. Wanger, Zollverein; Director of the Museum of Fine Arts at Berlin.

W. WYON, R.A., Her Majesty's Miut; Medallist.

True Jury of Class XXX, assembled for the first time on Monday the 12th of May 1851. In compliance with the instructions received from the Council of Chairmen, the Jury proceeded to elect a Deputy-Chairman, to make arrangements as to the time and place of their future meetings, and to nominate Sub-Committees, who should lay before the Jury detailed reports upon the several points of joquiry specially assigned to them. Lord Col-borne was elected Deputy-Chairman; and at a subsequent meeting the undersigned had the honour to be appointed Reporter,

The Suh-Committees having brought their investigations to a close with the ntmost dispatch consistent with the due performance of the arduous duties entrusted to them, severally laid their reports before the Jury, who, after the most mature and anxious consideration, have agreed upon their awards now submitted to the Royal Commissioners through the Council of Chairmen. As the Jury of Class XXX, forms a group by itself, and is not part of any other group of Juries, its awards have not been submitted to any other Jury or Juries for confirmation, as would otherwise bave been the case, according to the 12th Instruction from the Conneil of Chairmen. The Jury, however, considered it expedient to hold a special meeting as a group, and at that meeting the owards previously made were reconsidered and finally settled by Jurors. It is therefore upon the Jury of Class XXX. Class of Fioe Arts resta

Class of Fice Arts rests. In making these awards the Jury have seted strictly in accordacce with the principle laid down by the Council of Chairmen in their 18th Instruction. They have been guided solely by the merit which they have recognized in the individual works exhibited, without reference to countries, and considering the Exhibition as a whole.

And in compliance with the 20th Instruction, the Jury of
Class XXX, have made the proportion of the Council to
the Prize Medal, a very small one. Even had this instruction not been laid down in such precise terms by the Council of Chairmen, the Jury of Class XXX, would have felt it their duty to exercise great reserve in awarding Council Medals, knowing, on the one hand, that superior excellence is but very rarely attained, particularly in such works as fell within their jurisdiction, and

being aware, on the other, that it was only " for very pre-emittent merit" that the Great Medal was intended.

It baving already been explicitly stated that the Jury in making their a wards were guided solely hy the merit which they have recognized in the works exhibited, it might be deemed superfluons to add more on this point; there are, however, one or two facts, obvious indeed, but yet of sufficient importance to be recalled to the minds of such persons as might be led by the decisions of the Jury to draw invidious comparisons between one country and another. It is an obvious but most important fact to be borne in mind, that with respect to the principal branch of the subjects falling under Class XXX. (Sculptore), foreigners have laboured under peculiar difficulties in having had to bring over from distant parts, and at considerable expense and risk, statues in marble or bronze for the Exhibition. Again, all foreign artists have not njoyed the same means of overcoming these difficulties. many cases their Governments have given facilities In many cases their Governments may a sure and assistance towards this object, but, even then, this and assistance towards this object, but, even then, this Jury could not moreover but feel and regret the ab from the list of exhibitors of the names of some of the most distinguished artists in Europe. It might be invidious to meutiou iodividuals, hat it would be najust to pass over the fact unnoticed. Among the works, bow-ever, by natives of the United Kingdom, to which Medals have been aworded, there are two deserving notice on account of their being exhibited among the Romao sculp-tures — a graceful acknowledgment of the advantages derived by the artists from that school on which their eminent success reflects so much credit.

The scope and nature of the works on which the Jury of Class XXX, were called upon to adjudicate, gave to their position and duties a special character, and most necessarily impose a peculiar line of conduct upon the Reporter.

There is no doubt, for instance, that a history, however

rapid, of the rise, progress, and present state of most classes of industry represented in the Exhibitioo, will, in the majority of cases, form a part of, and add considerably to, the value of the several Reports, but to attempt such an historical sketch with reference to the Fine Aris must, of necessity, prove unsatisfactory and worse than usedon. The Jary believe, however, that their availes wife two just of the proon that of the pine. Are at all they have the wife two just in the proof that the pine. Are at the proof that they are the propose their particular in observing the navierally maintain in which they are held. They have saided with equal pleasur, that industry directed by science faster expenditure to the propose of the proof that the proof the proof the proof the proof that the proof the proof the proof the proof that t

The Jury of Class XXX, have been most anxions not to pass over any of the numerous objects in the Exhibition, which it might properly be considered to be their duty to examine. They think it unlikely that any article deservand diligent inquiries. On the other hand, this Jury have occasionally abstained from examining objects, respecting which, owing to the necessarily uncertain limits of the several classes, doubt might be entertained whether they strictly belonged to Fine Arts or not. Should the Jury of Class XXX, have been led, in some few instances, to limit their jurisdiction too much, they have the satisfaction of feeling that ample justice has been rendered to exhibitors by those Juries, to whose judgment such objects as have not been considered to belong to this Class have been finally submitted. Thus the Jury of Class XXX, have purposely abstained from judging of such metalcasts as they conceived to have been exhibited merely for the purpose of showing either the successful result of a new process, or the novel use of a particular metal. In case they were aware that another Jury were about to take these points into their consideration, and judge of these objects as specimens of mechanical industry. In some few exceptional cases, such, for instance, as those of Messes. Peace, Weishaupt, &c., certain objects have appeared to possess so strong a claim to be noticed in this Class, that the Jury have not hesitated to distinguish them by an award, although aware that they had been rewarded by other Juries; but whenever such instances of double awards have been made known to this Jury, the fact has been noticed in this Report.

The Jury would willingly have endowoured to state, and directed by the 20th instruction of the Conneil of Continue, the several grounds upon which four of the Great form of the Great found impossible to comply with the har instruction win respect to objects of sculpture, although the Jury felt how the continued of the continued

nite and more uniformly appreciable nature.

At a meeting held on the 5th of June, long before the question of individual awards came under consideration, the Jury agreed upon the following resolution:—

"That it is not desirable to assign the Council Medal

to every depict of art pre-emisently beautiful or excellent of the Clove or too, it to that it should be retailed inside to the highest works of the highest class." This results to the highest works of the highest class." This results the highest works of the highest class. "This results the highest become to any but works of art of the highest the highest become to any but works of art of the highest the highest become to any but works of art of the highest with those of other pairs guided by different pulmpiles. Class XXX have but does are their which the Janous via the highest class of the high works of the high works of highest properties of the high was to be a secondary to the high value of the properties of the properties of the high value or tipon there exercile many the proposition by those who conformed down. It is the high value or tipon there exercile many the proposition by those who conformed down. It is the secondary of the high value or tipon there exercile many the proposition by those who conformed down. It is the secondary of the high value of tipon there exercile many the proposition by those who conformed down.

In forming their judgment upon works in the highes

branch of art coming within their jurisdiction, the Jury have principally looked for the embodiment of ideas, thought, feeling, and passion; not for the mere imitation of unture, however true in detail, or admirable in execution. They have looked for originality of invention, less or more happily expressed in that style which has for twenty-three centuries been the wonder of every civilized people, and the standard of excellence to which artists of the highest order have endeavoured to attain. Wherever the nignest order have endeavoured to attain. Wherever indications of originality, clustened by a successful adapta-tion of this style, have been met with, the Jury have acknowledged a corresponding amount of merit; and it is this originality of conception, improved by such style, which the Jury have recognized by the honours placed at their disposal. They have endeavoured to record, in the most emphatic manner, their auxious wish that artists should study to give their ideas that form and life which spiritualizes every-day nature, and elevates the work of art to the place of a type of nature itself. The Jury of Class XXX, would point to the remains of the Parthenous as embodying the result of the great principles which they have been anxious to inculcate, and which they sire to see universally adopted. The limited number of Council Medals awarded must not, therefore, be re-garded as a proof of deficiency of taleat in the hulk of the works exhibited, but as evidence of the severity with which the principles adopted by the Jury have been

applied.
It was agreed to recommend that Conneil Medals should be awarded to the following works:—
To Professor A. Kiss, of Berlin, for his group east in

To Professor A. Kuss, of Berlin, for his group east in sine, and brouxed by M. Gzuss, representing an Amazon on hurseback attacked by a Tiger. (Prussis, No. 279, p. 1065.)

To Haron Maraccurryt, of Tarin, now of London, for his coloscal equestrian statue in plaster of Richard Cour de Lion. (Outside West, No. 76, p. 118.) To M. J. Paaduss, of Paris, Member of the Institute, for his marble statue of Phryne. (France, No. 1407,

To M. J. Pradics, of Paris, Member of the Institute, for his marble statue of Phryne. (France, No. 1407, p. 1343.)

To the representatives of the late Mr. Richard J. WYATT, for his marble statue of Glycera. Exhibited by

Captain LAYLAND. (Main Average East, No. 104, p. 128-5.) If was the unaimous impulse of the Jury on the unards being taken into consideration, to recommend that the same high diffusive law should be conferred on Mr. Deg. exhibited by the Earl of Yannoncom. Their insteads was defined by Mr. (Globon himself, who, well knowing that should be accept the office of a Juror of Class XXx, he could no longer receive a prite from that Jury, preferred serving in the brother artists to his own receiving the honour which he had so well descreed.

DIVISION A.—SCULPTURE AS A FINE ART.*

Section A.—1. In Metals simple, as Gold, Silver, Copper,

Pron. Zime, Lead, fre.

In this section of the works calonited to their judgement, the Jury warded the Princ Media to the following work, it being, however, understood that for this class or reward, when meet than one article was exhibited by the same arist, the Jury might, if they thought it expedient, countable in their judgment the various species of merit "To Nears. C. M. WEINBARTY SOSS, of Hanna (p. 1073). To Nears. C. M. WEINBARTY SOSS, of Hanna (p. 1073), for a Set of Chess-men and Beard, in silver and gold,

for a Set of Chess-men and Board, in silver and gold, ornamented with enamed. Although aware that the merit of these articles has been asknowledged by another Jnry, the Jury of Class XXX. wished to record their opinion of them as objects of art. (Prussia, No. 412.) The Jury were of opinion that the following artists

were deserving of Honourable Mention:

Mr. A. Verntre, of London (No. 97, pp. 686-690), for his designs for silver works executed by him for the exhibitors, Mesars, Hunt and Rossetta. Although a

* The classification of awards is according to that a lopted in the " Head Juries."

Cooncil Medal has been awarded to the exhibitors by another Jury, the Jury of Class XXX. considered it just to record their opinion of the merits of this artist.

(Class XXIII., No. 97.)
The Jury of Class XXX. have heard with great satisfaction that another Jury have suitably acknowledged the excellent workmanship of the Shield presented by His Majesty the King of Prussia to H. R. H. the Prince of Wales, on whose behalf it has been exhibited by H. R. H. PRINCE ALBERT. They think it, however, their duty to add that the several eminent artists who have contributed to the execution of the design of Director Cornelins 110), deserve the special praise of the Jury of Class (p. 110), deserve the special photo of the respectively XXX, for the taste and skill which they have respectively displayed in this work. deserving of Honourable Mention:Mr. J. Hanistaenoki, of Müoich, for his galvanography. (Bavaria, No. 85, p. 1102.)

To the processes applicable to the Fine Arts generally, belong those employed by the next three Exhibitors, whose claims the Jury of Class XXX, have acknowledged in the following manuer:

Prize Medals were awarded To Mr. B. Cheventon, of London, for his process of reducing sculpture by machinery, as exemplified in the

heseus. (No. 194, p. 832.) To M. A. Collas, of Paris, for his process of reducing sculpture by machinery, as exemplified in the Gates of the Battisterio at Florence, and other works. (France,

No. 1709, p. 1258,) The Jury were of opinion that the following artist was ing of Houourable Mention :-

Mr. B. E. Durra, of London, for specimens of a new process of executing floe-art designs on detached tiles; the design being hurst in on the separate pieces, and then put together. Exhibited by Messrs. II, Minton and Co. (Class XXVII., No. 51, p. 767.)

DIVISION G.- MODELS.

Section G .- 1. In Architecture.

The Jury having been directed to include architectural models in the range of their inquiries, were naturally led to reflect upon, and then to feel it a most agreeable duty to acknowledge publicly, the merit of the Building in which they met. The originality of the construction, and the rapidity with which it has been carried to completion would, in comparatively recent times, have induced popular enthusiasm to ascribe to fairy ageocy the power of overcoming obstacles hitherto considered to be insurmountable by human ingennity. The noble simplicity of the whole edifice, the striking grandeur of its proportions, the novel and ingenious application of the materials of which it is constructed, and the admirable adaptation of all its parts to their multifarious purposes, gave to the person who conceived it, as well as to those who, with so much zeal and success, carried out the constructor's design, a right to the highest award in the power of the Jury to recommend. The Jury had, therefore, the hunnur to propose that a Conneil Medal be awarded to Mr. Joseph Parton, and a similar Medal to Messrs. Fox and HENNERSON. And although the Jury Means, FOX and HENDERSON. And although the Jury had already rendered justice to the chins of Mr. Owen Joxes, by awarding him a Prize Medal for his chromo-lithography, they felt it to be their duty to record her their opinion of the advantages resulting to the Building from the simple and tasteful style of decoration which Mr. Owen Jones has so skilfully suggested and so successfully applied.

The following Prize Medals were awarded in this

To Mr. J. C. Boesche, of Magdeburg, for his models of Magdeburg Cathedral and of the Nuremburg Foun-tain, excented in limewood. To this artist the Jury have nlso made a money award of 30l sterling. (Prussia, No. 785, p. 1094.) To Mr. JABEZ JAMES, of London, for his model in

various materials of the Britannia Suspension Bridge. To Mr. S. Salter, of London, for his model executed in card of St. Nicholas' Church, now being rebuilt at Hamburg. (Class VII., No. 221, p. 331,)

The Jury were of opinion that the following artists were deserving of Honourable Mention: Mr. J. H. Cassenon n, of Oldenburg, for his model of

* Since the Award Book was closed, it has been ascertained that the two entries No. 257 and 258 refer to the same person.

Heidelberg Castle, carved in cork. (Oldenburg, No. 1, 821), J. Kyd (No. 10. Class XXX., p. 821), and J. Raw-Mr. S. Cundy, of London, for his restoration of the

Monument of Philippa of Hainault, in Eaglish alabaster, from drawings by Mr. G. C. Scott, (Main Avenue West, No. 60, p. 848. Prize Medal, Class XXVII.) Mr. T. DUNHILL, of Loudon, for his model in plaster, and other materials, of a Metropolitan Cattle Market,

with abattoirs, &c. (Class VII., No. 90, p. 318.)

M. J. LEEMAN, of Berne, for his model of the Nuremberg Fountain, carved in wood. (Switzerland, No. 258, p. 1283.,*
M. J. LEEMAN, of Zürieh, for his model of the Cathedral of Strasburg, executed in eard. (Switzerland, No.

p. 1282. Prize Medal, Class VII.)* Mr. W. Stuart, of Plymonth, for a model of the VII., No. 28, pp. 311, 312.

Section G. 2.—In Topography. The following Prize Medal was awarded in this sec-

To Mr. John Grantham, Secretary of the Liverpool Local Committee, for a model of the Docks and comm eisl portion of the Towo of Liverpool, in various materials. (Main Avenue West, No. 95, p. 851.)

Section G. 3, - In Anatomy.

The Jury of Class XXX. abstained from examining models in Auatomy, as such objects were transferred to another Class. (Minute of May 26th, 1851.)

Designe.

The various designs for decoration, tapestry, em-hroidery, mixed fabrics, &c., not having been submitted to the examination of any other Jury, the Jury of Class XXX. appointed a Committee of their own body, which, together with members of Juries of other Classes, were instructed by the Royal Comoussioners to report on the articles thus overtooked. This mixed Committee having reported accordingly, the Jury of Class XXX, proceeded to award the following Prize Medals:—

To MM. Branus Baothers, of Paris, for their general shility in designs for shawls. The Jury wished, however, to guard thenselves from being supposed to approve of the introduction of landscapes in such designs, as exhibited in frames Nos. 1 and 2. (France, No. 55, p. 1174.)

To M. J. Cheneaux, of Paris, for his cotton and calico prints, spart from their taste. (France, No. 1146, p. 1233.)

To M. C. E. CLERGET, of Paris, for his designs generally, and his exhibited works in ornameut. (France,

No. 799, p 1219.)
To M. A. Couden, of Paris, for his Shawl Designs, and for his skitful execution of his Designs generally, apart from their taste. France, No. 1566, p. 1251.) To the GOVERNMENT HEAD SCHOOL OF DESIGN, esta-

hlished in London. (Fine Arts Court, No. 10, p. 821.)
The mixed Suh-Committee examined the Designs intended for Manufactures, exhibited by this School, directed by Messes, J. R. Herbert, R. Redgrave, and H. J. Townsd; the female department being superintended by Mrs. M'lan. The Sub-Committee reported that in these designs they had observed a parity of taste, a propriety and chasteness of invention, and a well-understood adaptation of style for the several objects, which do great eredit to the directors and to their scholars The Sub-Committee, therefore (Mr. Redgrave, one of its members and a Juror of Class XXX, having withdrawn), felt it to be their duty to propose to this Jury that a Prize Medal should be awarded to the Institution. They moreover recom-mended that Honourable Mention should be made of three of the pupils, and that six other pupils, viz., S. Asy-worm (No. 87, Class XVIII., p. 558), F. Cettherer Collins (No. 86, Class XVIII., p. 558), J. S. Cettherer (No. 10, Class XXX., p. 821), A. Tows (No. 10, Class XXX., p.

* Store the Award Book was closed, it has been ascertained that the two entries, Nos. 257 and 258, refer to the same person.

LINGS (No. 10, Class XXX., p. 821), should be meutioned with much approbation. The Jury of Class XXX., after due inquiry and mature deliberation, approved unani-mously of these suggestions, and adopted the whole of these recommendations. The names of the three pupils to whom an Honograble Mention has been awarded will be

severally found in their proper place.

To M. E. LABOCHE, of Paris, for his Manufacture of Designs. (France, No. 291, p. 1190.)
To LUKE LIMNER (Mr. Leighton), for a variety of

To LORKE LIDDER (AIR, Leggmon), 10s a valuely of Designs. (Class XVII., No. 24, p. 538.) To Mr. Diouv Wyarr, of Loudon, for good taste gene-rally in his Designs. (Fine Arts Court, No. 30, p. 822.) The Jury were, moreover, of opinion that the following artists were deserving of Honourable Mention :-Mr. W. Aldaidor, a pupil of the Government Head School of Design, for his Designs. (Fine Arts Court,

No. 10, p. 821.) M. C. Braux, of Paris, for his Designs for Calico riots. (France, No. 72, p. 1175.)

Mr. JOHN CARTER, of Crayford in Kent, for his Designa unapplied. (P. 821.)
M. F. Dider, of Paris, for his Designs for Shawls. (France, No. 820, p. 1219.) M. N. A. GALIMARD, of Paris, for his Designs for

Painted Glass. (France, No. 228, p. 1187.) M. GRUNTHAL, of Berlin, for his Patterns for Berlin

M. GRUINSTRAL Of Hevin, for his Patterns for Berlin
Wool, (Pruissia, No. 166, p. 1095, for his Designs for
Carpett, (Clina XIX, No. 1927, p. 567.)
Mr. B. Heatin Class XIX., No. 289., of the Government School of Design at Nothingham, for his Lace
Designs. (Price Medal, Class XIX., p. 579.)
Mr. Envil Steracts, a popular of the Government Ledo
Mr. Envils Berack, a popular of the Government Ledo
Nr. Envils Berack, a popular of the Government Ledo School of Design, for his Designs. (Fine Arts Court, No.

Mr. J. H. Méreaux, of Paris, for his Designs for Lace Manufacturers. (France, No. 631. Prize Medal, Class

XIX., p. 1208.)
M. MEVNIER, of Paris, for his Designs for Shawls. (France, No. 638, p. 1208.) MM. NAZE and Co., of Paris, for their Designs for

Cotton Prints. (France, No. 625, p. 1207.) M. E. Picasp, of Rosen, for his Designs for Woollen, Cotton, and other Printing. (France, No. 347, p. 1194.) Mr. C. P. Slocombe, a pupil of the Government Head School of Design, for his Designs. (Fine Arts Court, No. 10, p. 821.)
Mr. G. Taueritt, of London, for his Design of a

wrought-iron canonied Tomb. (Fine Arts Court, No. 75,

The Jury of Class XXX., having brought their labours to a conclusion, eannot refrain from expressing their hope that steps may be taken for rendering the Great Exi hition as useful after it has ceased to be, as it has proved gratifying and instructive in the course of its short existexce. It is the wish to see these hopes realized, that impels the Jury, even at the risk of overstepping the strict limits of their functions, to submit, with great deference, their views on this point to the Royal Com-

The foundation of a permanent industrial Museum in the heart of the metropolis of trade and industry, seems to the Jury the logical and practical consequence of this Exhibition. It is in the "Crystal Palace" that the great truth has been impressed upon us, that art and taste are henceforth to be considered as elements of industry and trade, of searcely less importance than the most powerful machinery. It seems also natural that this Museum should in the first instance consist of the objects to which the several Juries have called public attention as happy types and models for imitation. While such a Museum, on the one hand, would be a lasting depository of industry and of the arts; it would, on the other, serve as the best and ensiest standard of comparison by which human ingenuity night mark its progress, on the opening, ten years hence, of a new Great Exhibition; --it would serve nlike as a guide and as a beacon.

Thus the Great Exhibition of 1851, which already stands out so prominently in the past, would bear fruitful and lasting consequences for the future, and would acquire as additional claim to a grateful record in the amusts of mankind.

The Greeks, our masters in the nobler arts, did not trust to the historian and the poet alone for the record of their achievements, but committed to the greatest artists the task of immortalizing their military triumphs. The Great Exhibition deserves to be celebrated as the triumph of industry and invention over commercial routine and international jeniousies. Whether the "Crystal Palace" shall be removed or not, posterity will look for some so variously and so powerfully contributed,

mark of gratitude to the illustrious Prince to whom the present generation owe the realization of a gigantio thought; a thought which may have floated in the minds of others, but which received consistency and was brought

to maturity by his energy and perseverance.

The Jury of Class XXX, therefore, hope that on the site of the Exhibition Building a statue will be erected to Prince Albert. Ou its base should be recorded the beautiful to the prince Albert. share which statesmen and others have borne in hringing such an undertaking to completion. The Fine Arts would thus be called upon to perpetuate the memory of the Great Exhibition, to the attractions of which they have

London, September 1851.

CLASS XXX.

SUPPLEMENTARY REPORT.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.

THE Exhibition of the Works of all Nations in the | had a claim to be admitted into the Exhibition; their Crystal Palace had for its primary and essential object the display of whatever could be characterized as a production of Industry. It comprehended every kind of nnwrought material, no less than the most ingruious nawrought masernat, no test than the most ingentous results of machinery, or the most exquisite examples of haudicraft. But this complete and absolute recognition of industry as the purpose of the Exhibition did not, in the view of the Moyal Commissioners, preclude from admission the productions of the Fine Arts; Painting admission the productions of the Fine Arts; Painting alone being excepted, because, being but little affected hy material conditions, it seemed to rank as an independent art. It was not without reason that such a course was adopted, when we consider how greatly, on the one hand, Architecture and Sculpture depend in the execu-tion of their details on mechanical dexterity, and, on the other, how intimately the Fine Arts are connected with many branches of manufacture. So closely, indeed, do their provinces border on those of certain other are that it is often difficult to decide in what rank or class objects should be distributed, in the production of which industry

and taste have been jointly employed. This is most strikingly apparent in the case of jewel-lery and other works in the precious metals, works in bronze, iron, zinc, porcelain, glass, terra-cotta, and also in avery description of faroithre; but it is not less true of earpets, tapestries, and embroidered and coloured stuffs, in all which the taste and beauty of the design depend upon the manner in which the material has been

treated and its special conditions observed, In the great markets of the world the preference will invariably be at once given to those productions which combine, with other indispensable requisites, the recommendation of good taste in their design and treatment. Among the many good results which we may venture to anticipate from this Exhibition, it may not be too much to hope for a foller revival of that happy alliance

between the Fine Arts and Industry which subsisted in the middle ages, when the artist was more of a craftsman -the craftsman more of an artist-than is the case at Indeed, even in our own day, such a system of co-peration has been established with regard to one object,

the technical application of materials; and of the signal results thus obtained many striking examples may be cited from the Exhibition.

Among these may be mentioned the wonderful speci-mens of casting in bronze, iron, and zinc; no art which, as regards the two latter metals, has only been brought to perfection in a recent period.

To the present age are also due two most valuable and

original inventions, by which works of sculpture may be reproduced, in the one case by means of Galvanoplastic deposit, in the other hy the mechanical processes of M. Collas, in France, and of Mr. Cheverton, in England, The cheapness with which the noblest works of art can be multiplied by means of these inventions cannot but tend to the more general development of a feeling for the beautiful. Such then are some of the results of the connexion between Industry and the Fine Arts.

But it was not only on account of their intimate asso-ciation with the interests of Industry that the Fine Arts

presence there, as was anticipated by the enlightened views of the Royal Commissioners, conduced essentially to the impressiveness of the general spectacle. It was the variety and beauty of the works of art that lent to the scene its peculiar grace and charm.

In this Report the objects contributed by the several nations will be considered in succession, commencing with Great Britain.

In the survey of each nation, its productions will be noticed in the following order:—

- A. SCULPTURE AND WORKS OF PLASTIC ART-1. Sculpture on a large scale, and in various mate
 - rials, whether marble, metal, or wood, 2. Sculpture and its varieties on a small scale, in
 - metal, "biscult," ivory, wood, precious stones, shells
- B. GRAPHIC REPRESENTATIONS ON PLANE SURFACES-
 - 1. New processes of painting.
 - 2. Enamels on porcelain or metal,
 - 3. Painting on glass, 4. Mosaics,
 - 5. Designs for woven and printed stuffs. 6. Various processes of printing, such as lithography, lithochromy, zincography,
- C. ARCHITECTURAL DESIGNS-
 - 1. The Exhibition Building. 2. Architectural and other models.

THE UNITED KINGDOM.

From the first introduction of the Fine Arts in this country to the present day they have received little or no notice from the Government as such; their encouno notice from the travernment is seen; their encouragement, fise that of many other important objects, has been left to the public. The foundation of the Royal Academy itself is of comparatively recent date, and the lustitution is self-supported. The collection of sculpture and antiquities in the British Museum, and that of point-and antiquities in the British Museum, and that of pointing at the National Gallery, have been formed only within the last half century, and many of their most valuable treasures are donations or bequests of private individuals. Before the building of the New Honess of Parliament the distinguished artists of this country had rarely been employed by the Government on works of a Monumental character, and such commissions were, from their nature, not the objects of private munificence. This is one principal cause why, in the English school of painting and sculpture, no true Monumental style has been as yet formed

Again, it was only in the year 1836 that the Schools of Design were formed; institutions by means of which the Fine Arts have exercised a most beneficial influence on the vast productive energy of Great Britain. Much improvement in every branch of industry has been accumplished by means of these schools, but it must be acknow-ledged that in many kinds of manufacture the English productions, both in regard to their form and colour, show far less taste than those of other nations

Both the Government and the nation, however, are now becoming conscious of the great importance of Art, not only in its Monumental character, but in its relation to Industry.

The vast range of comparison which the Exhibition has no forded, by the justapoint on the products of so many nations, has directed the English mind to more enlightened views; and, from the energy of the national character and institutions, these newly-awakened ideas may ultimately prove of the greatest benefit in regard both to the Fue Arts nud the Manufactures of the country.

A. SCULPTURE AND WORRS OF PLASTIC AST.

Sculpture on a large Scale. No other nation has exhibited so many works of this

No other nation has exhibited to many works of this elses as Great Britain. This may be partly accounted for by the fact that the Eaglish seniptors have not been embarrased, like those of other countries, by the cost of transporting their works from a distance; but the far greater wealth of the Eaglish, as compared with other nations, is another cause of this numerical superiority.

With regard to the quality of their sculpture, it must be enufessed that the productions of the modern English school, till within a comparatively recent date, have not been such as to command the approbation of the most competent judges.

In the earlier periods of English art the name of

Flaxmat stands alone; and, fertile as this great genius was in its entition, the execution of his works hardly was in its entition, the execution of his works hardly all his influence seems to have been scarcely felt for a considerable period; the strong tendency to fixelism *in the Eartlist elseviol of endputing found its natural expression in partrainture. Ciuntrey, long pre-emittent annual his consumeraries, renduced a creat number of nathribble his consumeraries, renduced a creat number of nathribble inconsumeraries, renduced a creat number of nathribble consumeraries, renduced a creat number of nathribble consumeraries.

sion in portraiture. Chantrey, long pre-emittent among his contemporaries, produced a great number of admirable busts; but in all the works of this period which have a higher pretention, and claim to rank as Ideal sculpture, there is a striking deficiency, not only in scientific knowledge, but in taste and in genuine Plasite style.

"A work is called Resistic when the arrist restricts himself to the tack of rendering an individual model in all its parts, form, character, and the like, just as they appear before him. On the other hand, a work of art is called blest when the arrist modifies the figure in these same respects, according to his own feeling for its inner significance and outward beauty of form—attributes which uccessarily vary in each case.

When we say of a work of snalphure that it possesses "wire," the following qualities cought to be implied. The surlays the most have so treated the solid material, such as stoom, metal, wood, with which he has to deal, as not to played, but so as rather to suggest to the eye the character of the object instanced, field, shapers, ow whatever it may be. Further, as we learn from the antique endpaire, in the treatment of rather is surface, the surfaces of shall not be treatment of material surfaces, the material shall not be impair the general here it is, but should be rather indicated by moderate depressions in heat suffersions in heat surfaces.

In drapery, again, to attain the same general breadth of effect in the larger surfaces, which are supposed to be defined by the forms and action of the body, the details of the fiblis should be represented not by big, heavy projections, but by numerous continuous channellines or merkines.

The scalepor most, moreover, take circ not to already.

The scalepor most, moreover, take circ not to already more of the fold materials recapity voted already all scales and the should a logic a travened more can more conventional in about 18 along the scale more conventional in adoption, for the folding more control most farther in the folding materials. The scale materials was deliver as in exercised most farther in the solid materials of the scale materials was deliver as in exercised most farther in the solid materials where the scale materials was delivered in the scale materials where the scale was the scale materials where the scale in its first delivered in the scale materials. The scale materials was along the scale materials where the scale is in high, missible, or scale materials was scale materials.

To this general criticism E. B. Baily (p. 847), in his best work, form a distinguished exception. Among these, however, we can hardly recken the three statues in the Exhibition, of a llunter, a Yonng Girl, and Ecc. of the latter a cast in sine only was exhibited. But the merit of these works was not overlooked by the Jury.

who have awarded them a Prize Medal. (P. 8, 6 and 5). Since the period referred to a new mee of complore Since the period referred to a new mee of complore degree the qualities in which their predecessors were dedicted. Along the chief cames which have combined to produce this school may be reckness the influence of the produce the school may be recknessed the influence of Greek at preserved to us in the Eigin markles, and the example of the great Thorwalden, with whom many of the Eighth sculptors at Bone had constant

Among the most distinguished of contemporary scalposes we have percellal mention the name of Gibson. In his Hunter and Dey a lively and imaginative ecception his Hunter and Dey a lively and imaginative ecception lines, and with through knowledge. The treatment is strictly Plastic; the details carefully and conscientiously wrought out. The manimous award of the Jury would have bestored the Conneil Medial on this week had not distinguished the Conneil Medial Med

Next should be mentioned the name of Mr. RICHARD J. WYATT (Main Avenue, East, 120, p. 1286, and Illustration), whose death, in the full maturity of bis powers,

we have to deptore.

His statue of Glycera represents a girlish figure, slight

and full of simple grace; the characteristics of femiline beauty are indicated in the modelling with great delicacy; the drapery is treated with good taste, and with a due regard for style. One feeling pervades the whole design, and imparts to it a peculiar charm. This work, therefore, united all those qualities which entitled it to receive as the following temperature of the pervadent of the total control of the pervadent of the pervadent of the total control of the pervadent of the pervadent of the total control of the pervadent of the pervadent of the total control of the pervadent of the pervadent of the total control of the pervadent of the pervadent of the pervadent to the distinguished names already noticed:—

J. H. Posks, of London (p. 1885, and Himstripics). A Victor As Novem of the a cett in placing and conders the control of the c

style.

J. Bella, of London (Class XXII, 64), p. 66). The Eagle-alayer, east in bronze, and also in iron. This fearner represents a powerful man in very strong action, at the moment after shooting an arrow into the air. The violence of the exertion has brought the muscles into full play. The artist has admirably succeeded in expressing the momentary and transient character of the action, and

that the whole profile of the relief should be restricted within a given scale; that, again, there should not be more than two distances in the composition, so that two figures at the most can stand one behind the other; in attempt greater depth is to invade the province of picture-span composition, and by destroying the idea of relief from an actual plane, to cause inslittentenes of outline.

the form is modelled with a knowledge and truth of detail which are seldom found in the English school, His work bas, therefore, obtained the Prize Medal.

In the statue of Falkland in plaster, p. 847), executed for new Houses of Parliament, the same sculptor has displayed a mastery rarely attained in portraiture; the conception is very spirited, the treatment throughout strictly Plastier; the figure is remarkable for its uoble presence, and its attitude of calm and dignifical repore. The following artists also exhibit, in their styles, the

application of jūst principles of art:— The most remarkable work of this earliptor is his Dee (in platter, p. 80). This work of this earliptor is his Dee (in platter, p. 80). This graceful, and the expression of longing curiosity well rendered. We may also mention his Girl at Prayer in article, ladd, a, figure treated with simplicity and depth of feeling, and very carefully executed. His marble figure Deep (1004), has also considerable merit. Fraze

W. Calder Marshall (5, p. 844, Sculpture Court). The Sabrius of this artist is remarkable for the feminise grace of the motive, the bend has a fine character of individuality, and there is great beauty in the form and in the general expression: in marble. Prize Medal.

the geomic approximation in markle. Prize Medal.

"C, States, of London (19), 84-14. A by structured
in lizard. This is a remarkable work-spite unlike, in
a lizard. This is a remarkable work-spite unlike, in
continuous control of the prize and the little of the little

tion. Prize Medal.

J. Houax, of Ireland (14, p. 843). A drunken Satyr,
gorged with new wine, which has distended all bis veius
and muscles, makes a last effort to save binself from
falling. This work coatains evidence of careful study,
but the attitude has something violent and ungraceful:

in plaster. Prize Medal.

B. Jennings, of Loudon (81, p. 846). In his murble figure of Cupid this artist has been very happy in the

representation of youthful form.
The same may be said of the Arethusa of E. Thaure,
of London (58, p. 845, a recumbent figure leaning or
one elbow, though there is rather a want of like and individuality in the features. A Boy catching a Butterfy
(56, p. 845, by the same artist, is a carefully executed
and attractive work: in marble.
A Nymph batting, by J. Lawson, of London (22,

p. 841.), also deserves softer here; in mattle, All the three last-mestioned work have obtained Princ Medials. Warrow, or I Loudon; 100, pp. 843, ishers low greatly this artist excelled in Gone sculpture. The figure, which is executed out of a very beautiful block of mattle, is nested; and the second of the second of the second of the principle of the second of the with great spirit, and with constraints in bloom. The (p. 843) by the same artist, are also remarkable specimens of the same class of recipture, though not equal in large; in markle. Price Medial.

L. MACONALD, of Rome (Rome, 18, p. 1286). The leonic figure by this sculptor, executed in the manuer and costume of classical antiquity, shows that the artist has a just perception of style and sound knowledge: in marble. Prize Medal.

In conclusion may be noticed the following artists, as deserving the Honourable Mention bestowed on them by the Jury:—

W. Behnes, of London, for his Nymph startled by a Lizard: in marble 54, p. 945). W. Theed, of London, for his marble group of the

Prodical Sen (59, p. 845) embraced by his Father, and for his Narcissus (79, p. 846, also in marble. H. Weekes, of Loudon, for his Sleeping Child with a Dog: in marble (p. 853).

E. B. STAPHENS, of London (p. 853), for his Deer Stalker and Dog. F. M. Milles, of London, for Two Orphan Children

at Prayer: marble sp. 850.

Mr. and Mrs. T. Thounvenorr, of London, for the Royal Children, in the characters of the Four Seasons: in

noyal Conduct, in the cuntacters of the Poir Session: in plaster (34, p. 844).

G. MYERS, of Lendon, for the Tomb of Bishop Walsh, in stone; a monument in which the ecclesiastical style of the middle ages is well sustained, not only in the principal

the middle ages is well sustained, not only in the principal figure, but also in the accessories. Prize Medal. (Class XXVI, p. 761.) To this list the uame of HAXCOCK (p. 849) deserves, in my opinion, to be added, for his states in plaster of the Beatriee of Dante, in her beatfied state. The figure is distinguished by a pure and noble expression of the lessel, although many defects may be remarked in the drane; v.

In cookluding this notice of Finglish sculpture, it is right to mention that several highly distinguished artists have not contributed asy works to the Exhibition. 2. Sculpture on a small Scule.

To this branch of English art the remarks already made on sculpture on a large scale are generally a plicuble. Even at the present day many of the most distinguished artists who have executed and exhibited works of this class are foreigners.

1. Works in Metal.

(a.) Embossed (Reponesé) Work,

A. Yurra; of France (p. 66-2), at proves sceled in Explaind. The work of this sirt in strictures belong Explaind. The work of this sirt in strictures belong Explaind. J. V. Mozzz and Cn., of Paris, now settled in London (p. 693). This firm cashibit as et of cups, made of disferent kinds of precious stoses, decerated with small figures, animals, mask, and other community, explainly greated and properties of the contraction of the consumer reflect dates. In the expression of the heeds only there appears a somewhat to modern sentiment. The takent displayed in three works in so remarkable, dustant displayed in three works in so remarkable, dustant displayed in three works in so remarkable, that have been rewarded with a Council Medial, they cannot be passed in interes here. (Clans XVIII. No. 117.)

(b.) Medals and Coins.

W. Wvon, of London, Chief Engraver of the Mint* (p. 858). This artist is certainly one of the most distinguished of his class is the prevent day. He is endowed with a just perception of nature, and a refined sense of beauty in form and movement. His works are executed

 This notice was written a few days before the death of the distinguished strist to whom it relates. in mezzo-relievo, in that style which alone is admissible in Numisaatie Art, and which he has brought to great perfection. Both the Medals, and the enlarged models of Medals, which he has exhibited, fully bear out these re-marks. But I would particularly call attention to his models of the heads of Her Majesty and His Royal Highness the Prince Albert, for the obverse of the Prize Medal of the Exhibition. His office of Juror alone disqualified

him from receiving a prize. (Class XXX. Nu. 284.) L. C. Wyon, of London (p. 838). This young artist is a worthy ioheritor of his father's talent. His portraits of the children of Her Majesty and that of His Royal Highness Prince Albert, as well as his model for the reverse of the Prize Modal, are excented in a very good style, and the whole is wrought out with the carnestness of a labour of love, as well as with great simplicity and feeling for nature. Prize Medal. (Class XXX, 286.)

2. Works in Ivory.

R. C. Lucas, of the Firs, Winehester (306, ihid, p. 840) This artist has executed with great fidelity copies of several of the most celebrated autique works in the British Museum, such as the bronzes of Siris, the supposed head of Proscrpine on the medallions of Syracuse, and the admirable carving in hone-stone by Albert Durer, representing the Birth of Saint John the Bantist, also in the British Museum, Honourable Mention,

3. Works in " Biscuit

MINTON and Co. (Class XXV, 1, p. 709-11). The prouctions of this great porcelain manufactory properly belong to Class XXV., and have there been rewarded with a Council Medal; but so many of them deserve to rank as examples of Fine Art, that I think it right to mention them here. I would particularly notice the enpies of the celebrated silver cups in the Museo Borbonico at Naples, with groups of centaurs in relief, the copy of the Parnese Flora, and also two frieres. The ductions, by means of which the finest models of Art are

circulated, and a correct taste more widely diffused The same laudable endeavour to spread the knowledge of Art is apparent in the manufactures of Copelann (p. 711-14), Charles Meigh and Son (p. 720-22), and Josiah Wedgwood and Sons (p. 717-19). The manufactory of Ball and Co., at Glasgow (p. 724-25), deserves especial notice, on account of the judgment generally displayed in their choice of forms from the autique. The more sparing use of gold as an ornament distinguishes these works from those of most other English manufactories.

4. Carvings in Wood,

Wood carving was from a very early period much esteemed by the English, and has been diligently culti-vated among them. An extraordinary number of speci-mens, not only in the Gothic and Renaissance styles, but in the "Rococo taste" of the last century, have been contributed to the Exhibition, and many of them are of the greatest merit. Though the greatest part of these imens are articles of furniture, and therefore belong to Class XXVI., yet among them are two of such high artistic merit, that I cannot omit a passing notice of them artistic merit, that I have sideboard, exhibited by Cooke and Sons, of Warwick (p. 827). (2.) A bookease in the style of the Renaissance, by Holland and Sons, of London (161, p. 745, and see Hinstration).

of Löndon (16), p. 149, and see Hillstration.

Among the wood carvings which may be considered purely as works of Fine Art, nre—(1.) Those of T. W. Mallis, of Louth, in Lincolosbire (89, p. 925, and see Illustration). This artist has represented various kinds of the control o of dead game with a true feeling for nature, and with an extraordinary mastery in every kind of detail. He is extraordinary mastery in every kind of uccan. Are in also entitled to the greatest praise for his carving of a mass of viue-leaves, which is executed with the most minute and scrapulous imitation of nature, without losing the characteristics of a true Plastic style. Prize Medal. (Class XXX. 89, p. 825.)

toria, and richly ornamented with carved reliefs; also, a group of musical instruments, among which may be espe-cially noticed a violin. These works show an extraor-dinary dexterity in the treatment of the material, and the ornaments of the eradle are in excellent taste. Prize Madal

In concluding this notice of works of sculpture of the United Kingdom, I must mention the machine invented by Mr. B. Cheverton, of London (194, p. 832), for the reproduction, either on the same or on a smaller scale, of works of sculpture. The figure commonly known as the Theseus, in the Elgin collection of the British Museum, has been reduced by this process in alabaster, for the purpose of casting io plaster, with an accuracy which leaves the most fastidious critic nothing to desire,

The benefit which all lovers of Art, and more partienlarly artists themselves, will derive from this discovery, are so ohvious, that I need not further insist on them bere. Prize Medal.

B. GRAPHIC REPRESENTATIONS ON PLANE SURPACES.

1. New processes of Painting. B. E. Duppa, of London (Class XXVII. 51, p. 767),

the inventor of n new mode of monochronic painting on tiles. The painting has all the appearance of a chalk drawing, and is so united with the tile by the action of fire, as to bear any amount of exposure to the weather.

Among the specimens exhibited of this process is a head which appears exactly like a drawing in red chalk. Honourable Mention.

2. Examels on Porcelain or Metal.

W. Essex, of London (241, p. 835-36), exhibits a number of copies of celebrated pictures, such as the so-called "Gevarius" of Vandyke; Joseph and Mary with our Saviour, by Mnrillo—both in the National Gallery; and a Young Girl, after Sir Joshua Reynolds. In all these copies the drawing, colonring, and general character of the originals are rendered with the numer fidelity. Other specimens, however, such as the Portrait of Shakespere, and that of Her Majesty Queen Victoria,

of Shakesperc, and that if Her Majesty Quiese Victoria, are somewhat hard, patchy, and deficient in modelling. These channels are on metal. Prize Medal, S. Chenyras, of London (246, p. 830). The picture by Murillo in the National Gallery, mentioned in the pre-ceding notice, has been admirably copied by this artist on

ceding notice, has been admirably copied by this artist on poreclain. Every trait in the uriginal is rondered with the nimont delicacy; this work reflects the highest credit on its author. Honourable Mention. Lastly, the following artists may be noticed as fully deserving the Honourable Mention they have obtained: EXELPARSH and WOTLAH (Class XXIII., 140, p. 695.), for the potentials of the Queen, the Prince of Walker, and of H.R.H. Prince Albert, on a Jewel-case belonging to Her Majesty Queen Victoria; HASLEN (Class XXX., 237, p. 835), for his St. John, after Murillo, and also for his Ecce Homo, after Corregio, both which pictures are in the National Gallery; Bell (249, ibid., p. 836), W. C. Boxi (233, p. 835), and lastly, Branler, of Stoke-npon-Trent (Class XXV., 2, p. 711), for a duck enamelled on cbins, and exhibited by Copeland.

3. Painting on Glass.

In this branch of painting there are two very distinct styles. The one has been principally employed for the decoration of church windows, and being thus intimately associated with architecture, must rigidly conform to its laws. Thus, in this style the general character of the ornament should be Architectonic, the patterns should be very distinct, combining beauty of form with harmony of colouring; there should be great repose in the attitudes of the figures, and the draperies should be in simple masses. The other style of glass-painting attempts to give all the effect of an actual picture, strictly so called, and to heighten this effect by the gorgeousness and trans-parency of the colours. The former of these kinds of glass-mainting is to be regarded as of higher importance, W. G. Roccus, of Loudon (353, p. 842). A cradle and has more claims to rank as an original art than the executed in lox-wood for Her Mnjesty the Queen Vic- latter, which, however, is capable of being made very attractive. But it is of the greatest importance not to mix the two styles. This has been done in many windows executed in the 10th and 16th centuries, in which the arrist, abandoning the Architecturic laws, which onght to be his guide, has attempted those higher artistic effects, which are only to be sechieved in other materials, such as oil or fresso, and has consequently fallen very far short or his aim.

Very good works in both kinds of glass-pinning were to be seen in the Calibidion, hut there must by no means be taken as the best specimens which the art of our age is capable of pooling. It is much be regreted that the Lakebinson and the calibidion of the capable of the capable of pooling and the capability of the capability of the very at Munich, or of the initiation of pictures by Messr., Basseefe, of Bonn; in both of which enablishments works have been exceuted which have hardly been surpassed in the present age. If is right to add, that the training in the estilishment at Munich is useful oration.

It is of the greatest importance in the imitation of anomical gains, which is now so generally attempted, that the characteristics of different periods should be faith-the characteristics of different periods should be faith-the clottle style makes this discensionation of styles all the more necessary. But the study of ancient examples may lead to the perceivation of asts, if the artist period is adhering to the conventional forms of the mediarial styles, and choose in ignore the supporter knowledge of styles, and choose in ignore the supporter knowledge of stated be observed, they will be found perfectly compatible with natural forms.

(a.) Ecclesiastical Style.*

J. Hannan and Co., of Birmingham (Class XXVI), 522, p. 761). In the window-glass exhibited by this establishment in the Medizeral Court, the true principles of the style have been faithfully observed; and the accusion of the work is very careful. It may be noticed, however, as a defect in these windows, that the glass of observed; and therefore the plant of the work of the wo

Prize Medal.

Chance Baothers and Co., of Birmingham (Class XXIV., 60, p. 706). Two Gothic windows also executed according to correct principles. Honourable Mention.

The three following artists also deserve the Honour-

The three following artists also deserve the Honournble Mention which they have received: HOLLAND and Sox, of Warwick, for their "Life of Christ" (bids, 63, p. 706). I, G., Howe, of London (bids, 67, p. 707), for his imitation of an ancient painted window. W. WALLES (bids, 73, p. 707), for the decorative part in his design. The figures are not equal in merit to the rest of the work

(b) Pictorial Style.

M. and A. O'Conxon, of London (lihd., 67, p. 707). In his Itaising of Lazarus, this artist has been very successful in giving the characteristics of an oil painting; everything is in perfect keeping, and is drawn with great truth and care. In the richness of the colouring, he has turned his material to very good account, Hononrable Mention.

4. Works in Niello.

In this kind of art, which received the name of "Niello" work in the middle ages, figures or ornaments are first engraved on a silver plate, and the incised lines are then filled up with a paste coupounded of silver, copper, lead, sulphur, and borax. The dark colours so inialad contrasting with the highly surface of the silver, produce an effect not unlike that of a print from a copper plate.

This art, which had been for a long time neglected, was revived in the present day with great success by

"This style of glass-painting might be termed Architectonic, as it is applicable not only to churches, but to many other edifices, civil as well as religious.

Wagner, a silversmith from Berlin, established at Paris. In the exhibition was a gauntlet, on which a design by Maclise was engraved in niello, by S. H. and D. Gass, of Loudon (Class XXIII., 63, p. 683). The work is very skilfully exented. Honourable Mention.

Designs for Printed and Woren Fabrics, for Embroidery, and for Book-covers.

The primary law of all noch doigns is, that they must ome distance the fatness of the surface on which they are drawn, hist only diversely it with lines agreeable to the other control of the surface all perspective views not be Isoloinity rejected, as at all perspective views not be Isoloinity rejected, as at the surface of the surface of the surface of the controllay affected by the quality of the materials and such, though of a yielding sextame, pattern will be overtaken to the surface of the surface of the surface shows the surface of the surface of the surface of the necessaries of the body in a general series; hence the mercaneous of the body in a general series; hence the order insides chotten, cottons, on the century, and other insides chotten, or the century, and other insides chotten, or the century, and other insides chotten, or the century of the century, and other insides chotten, or the century of the century, and other insides chotten, or the century of the century, and other insides chotten, or the century of the century of the control of the century of the century of the century of the control of the century of t

M. Diony Wyart, of London (Class XXX, 30, p. 822), exhibits a considerable number of designs for various purposes. They are in very good taste, and in perfect necovikance with the principles here laid down. Prize Medal.

John Leiturron, jun., of London (Class XVII., 24, p. 538). The designs for book-covers exhibited noder this name have very remarkable merit, from the variety of forms in the patterns, and the happy choice of the colours. Prize Medal.

C. J. Richannson (Class XXVI., p. 208, p. 751). Out of the multitude of designs exhibited by this artist, some show a good taste. Prize Medal. The following names have also been Honourably Men-

The conowing names have also been Homonrahy Mentioned; John Cartra, of Cray fird in Kent (10, p. 821); J. K. Haavix (Class XIX., 197, p. 567), for the design of a carpet with a rich pattern; and Brist. Healin, for his design for lace (269, p. 570). Prize Medal.

The Government Hara School or Dissich in Lower In Losmon (10, p. 82). The designs for textife fabries contributed by the pupils, both male and female, of this estahilahment, were executed in such good taste, and with such correct knowledge of principles, that a Prize Medal was awarded to the Institution, and the names of several of the pupils were mentioned with approbation. These names will be found in the Report of Mr. Panils.

This seems to be the most fitting place to outlete the spectres of the Orivinal and a white he had. Turber, and present of the Orivinal and a white he had to be a support of the Orivinal and the spectra of the Orivinal and the spectra of the spec

What a lesson such designs afford to manufacturers, even in those nations of Europe which have made the greatest progress in industry!

In these remarks I have specially referred to the productions of India, Some of the fahrics exhibited by Turkey and Tunis display analogous qualities, but in the greater part of these we trace in the patterns an European influence, which has overhald or partly superseded the trace characteristies of the unitomal style of oroament,

6. Architectural Designs.

G. Tauefitt, of London (75, p. 834). A design for a Gothic tomh and canopy, to be executed in iron; the proportions in this design are very good, the style very correct, and the treatment suitable to the material. Honourable Mention,

nourable Mention,

7. Various processes of Printing, such as Lithography,
Lithochromy, Zinco-raphy.

The art of printing in colours has been brought to such perfection by the employment of several successive plates for the same impression, as in many cases to produce an effect quite equal to that of a painting.

(o.) Lithochrossy.

Day and Sox, of London. The specimens enhibited by this establishment are admirable for keeping, force,

by this establishment are admirable for keeping, force, and finish. Prize Medal. (80, p. 825.)

M. and N. Hashawr, of London. In the plates executed by these artists there is a eleganose, force, and har-

mony of colouring, combined in a degree which is very rarely attained. Prize Medal. (64, p. 823.) HULMANDEL and WALTON, of London. In the works of these artists we find similar excellences in a very high

degree. The specimens are executed partly with the stump, partly with lithographic chalk and the stump comhised, and finally by printing in colours. Prize Medal. (71, p. 82t.) Owry Joyze, of Loudon. In the establishment of this

artist flower and fruit-pieces are executed with great force and truth, and in his patterns he shows excellent save. In his initiations of ministures he has been less happy, though these works display considerable merit. Pure Medal. (54, p. 823.)

T. UNDEAWOOD, of Birmingham In the novel attempt to represent water-colour drawing by printing in colours, this artist has been most fortunate: the specimens exhibited by him are well worthy of Homographe Mention, (77, p. 823.)

(b.) Printing in Oil-colours.

G. RANTEN of London. The view of the exterior of the Exhibition Building, and a female portrait by this artist, show very great skill in a process which so seldom yields a successful result. Honourable Mention. (115, p. 828.)

(e.) Zincography.

R. Appel (274, p. 838). This artist is the inventor of a process, hy which he transfers to a zine plate nucleut or modern engravings, and woodent impressions, as well as drawings executed either with the pen or the pencil, A peculiar kind of ink is employed for the transfer; and not only is a perfect facsimile of the original thus obtained, but copies, to any extent, of this facsimile are again produced, at an exceedingly moderate price, and all of equal excellence. A woodcut by Albert Durer, taken from his " Life of the Virgin," the zine matrix to which this was transferred, and the impression from this plate, which were all exhibited, afford sufficient evidence of the value of the invention. Many years ago Messrs. DUPONT and Co. (France, 181, p. 1182), of Paris, obtained similar results by their process of transferring designs to stone: for this they have received a Prize Medal in Class KVII. (Printing). The advantages of such me-chanical means of multiplying rare and costly prints are too obvious to need remark. Every kind of drawing can be executed in Mr. Appel's prepared ink; his invention has therefore this great advantage, that it enables artists at once to fix and reproduce their sketches, instead of having recourse to lithography, woodcutting, or engraving on metal. The most rapid and evanescent expression of an artist's thought may thus be arrested, without impairing the spirit of the original sketch in the process of transfer. Prize Medal.

(d.) Facsimiles of Printing executed by the Hand. J. Haants, of London. The masterly imitation of old printing, by this artist, has received Honourable Mention, (Class XXX., 244, p. 836.)

C. ARCHITECTURAL DESIGNS.
1. The Exhibition Building.

In this most admirable edifice every kind of excellence appears to be combined, whether we consider the wonder-

fin adaptation of the whole hallings in its purpose, the superscipa skill discuss in the employment of gibes and superscipa skill discuss to seek, the large plantees of the tenmeration on very seek, the large plantees of the conmeration of the seek, the large plantees of the seek and extent of the whole plan, must have been exceedingly direct, the employed of the mood of construction, of of the colours with which the hallings is ormanested of the colours with which the hallings is ormanested of the colours with which the hallings is ormanested for the choice of the colours of the seek of the colours of the seek of the colours of the seek of the colours of the first the choice of the hallings; to Meser, Fox, Haxane, or, and Co., the Contractors, for the assumpty immune in the plantation. Control Mechal a webside to the two forms by Clant Villar seek and control Mechal a webside to the two forms by Clant Villar seek and control Mechal a webside to the two forms by Clant Villar seek and control.

2. Models.

The practical ntility of architectural models, and the instruction and pleasure that may be derived from them, have never been more sensibly felt than at the present day. This brauch of art was therefore very properly represented in the Exhibition.

John Grantham Secretary to the Liverpool Local Committee: A Model of the Town of Liverpool. This work is executed with great accuracy, the proportions are said to be very well preserved, and the details finished with great care. Price Medal. (Main Avenue West.

95, p. 851.)

T. Dennetta, of London, Model of a Metropolitan Cattle-market, with abattoirs, and other appurteoances, as executed in plaster and other materials, and very skilfully planned. Honnarable Mention. (Class VII., 90,

p. 518.)
W. STUART, of Plymouth. Model of the Plymouth Breakwater in limestone. Honourable Meution. (Class VII., 28, p. 314-12.)

In coacheding this notice, I must also mention the Mediavard Coart, Sitted up by Professor A. W. Pears p. 764), one of the most distinguished among Fagish architects, as a designer of Gothle buildings and ornament. In this Coart he has endeavoured, with great coclessated art of the middle age, by exhibiting an assemblage of altars, shrines, topestries, painted windows, challects, and pastent, venturents, and other ecclesiastical

¹ It has been remarked by several distinguished authorities that, when its is painted, the author of the material should be indicated by the colours employed. This is, no doubt, runs, as a general principle, yet, in this instance, and the colours of the control of the colours of the co

furniture and objects. Most of these articles are executed from his own drawings. The merit of the collection has been duly acknowledged by the Jury.

THE ZOLLVEREIN.

1. PRUSSIA.

Since the year 1815 great efforts have been made in Prassia, by the successive monarchs and administrations of Prussis, to encourage the Fine Arts in that country. Museums, and other buildings of a similar character, have been creeted; sculptors, and more recently painters, have been employed in the execution of monumental works, and the cultivation of all those manufactures on which art can exercise any influence, has been greatly pronoted by the foundation of the "Iustitution for Trades" (Generic-Institute), under the energetic and judicious management of Privy Councillor Beuth. That these efforts have led to the happiest results has been proved by the Exhibition, which has furnished to Prussia long-desired opportunity of showing what progress has been made.

A. SCULPTURE AND WORKS OF PLASTIC ART.

1. Sculpture on a large Scale. Until the commencement of the present centory, the Berlin sculpturs continued to imitate the false and man-

nered style of the contemporary French school. The first who returned to the principles of nature, and to a careful expression of details, was the sculptor Schadow. But the Berlin school owes its present excellence to the auspicious co-operation of three great men, who de-voted themselves to its improvement. These were, the late architect Schinkel, the late sculptor Frederick Tick, aud Christian Rauch, a sculptor whose active energies still remain unimpaired outwithstanding his great age. These three artists had profoundly studied the master-pieces of aucieut art; the contemplation of these had imbard their minds with an intense feeling for beauty, and revealed to them the great laws of style. Inspired by these models, they did not attempt to reproduce them by a servile and spiritless imitation, but rather to apply the principles therein developed to works fitted for th wants of modern times, combining this reverence for antiquity with an earnest study of nature, and a most diligent and scicotific carefulness of execution. It is to be regretted that Rauch himself cuntributed uone of his works, if we except one or two copies from his Victories; and that many of his distinguished scholars, such as A. Fischer, Gustav Blaeser, Wredow, and Schievelbein were also absent.

But though the school of Berlin was thus only partially represented in the Exhibition, yet many of the works it contributed gave ample proof how great have been the results of the combined influences which have aided in the development of German art, A. K188, of Berlin (279, p. 1065). An Amazon on

Horseback attacked by a Tiger. With a ferocious bound the animal has leaped upon her horse, and fastened on him with teeth and claws. The Amazon is about to transfix her assailant with her spear. This work, which is on a colossal scale, has been cast in zinc by Geiss from the original model, and bronzed by electro-deposit. In this group the artist has, hy an original and powerful effort of invention, placed before our eyes the most eritical moment of the action. The whale expression and character of the Amazon are very nobly conceived; the anatomy displays consummate knowledge; great style is shown in the general treatment of the surface, and the details are wrought out with wooderful farce and truth. The whole work is full of soul; it seems the full earnest utterance of a true artistic nature. The great qualities of this work called forth, at the

time of its completion, the most unbounded admiration on the part both of artists and friends uf art. It was executed in bronze by a public subscription, and now ornaments one side of the staircase of the Royal Museum at Berlin.

where a work of art possesses striking merits, even considerable faults cannot counteract the favourable im pression which is produced. It is one of the fundamental laws of sculpture "in the round," that from many, but at all events from the principal, points of view the out-lines of the figures shall be distinct, and at the same time beautiful; and this rule is signally transgressed in the work of Kiss. The forms of the tiger and the horse are blended together in one confused mass, so that the front view is very unsightly, and even in the side views we lose on one side the head of the horse, on the other that of the tiger. Council Medal.

F. DRABE, of Berlin (273, Prassin, p. 1065). The pedestal of a statue of King Frederick William III, of Prussia, erected by the inhabitants of Berlin as a token of their gratitude fur the embellishments which this monarch has bestowed on their Thiergarten (Zoological Gardens). The work exhibited is in plaster, half the size of the original pedestal. In the reliefs with which it is oronmented the sculptor selected subjects which contain allusions in the local destination of his work. Thus he has represented a number of figures, of every age and sex, enjoying themselves in the open air. We see groups of children looking into a bird's nest or feeding the awans, young maidens weaving garlands, old people leading children to the scene of the sports, or contemplating their youthful gambols with an nir of calm enjoyment. There is much beautiful feeling in the treatment of this subject: the heads are full of expression, the movements of the figures very spirited, and the different groups are skilfully connected. The composition is executed in a very good style of alto-relievo, the details

finished with the greatest care.

On the whole, this work is deserving of the very great and general admiration that has been bestowed upon it. It may however be noted as a defect, that the artist has not throughout preserved the relative proportions of the figures. Prize Medal.

ALBERT WOLFF, of Berlin. A statue in marble of a young maiden holding a lamb to her arms. This figure is entitled by the sculptor "Innocence," and its purity and simplicity of character fully express such an idea. The drapery is throughout treated in a plastic style, and the exemption is very careful. Prise Medal. (No. 307. p. 1067.)

T. Kalide, of Berlin. A Gronp. A Boy, lightly grasping a swan and looking apwards, holds up his left arm as if to guard himself. The group is designed far a fountain, the water being meant to issue from the beak of the swan.

The figure of the boy is very prettily conceived, and the action very spirited. The whole work is executed with care, and in a good style. Duplicates of this group were exhibited; one in bronze, the property of His Majesty the King of Prussia, the other cast in zinc by Geiss. Honourable Mention. (No. 285, p. 1066. Prize Medal awarded, Class XXII.)

C. MOLLER, of Berlin. Several bronze casts of animals from models by this artist were exhibited: a Newfoundland Dog, east by Friebel, of Berlin; a smaller Dog, of the same kind, with a Boy, and a Bulldog with a Girl, by the same kind, win a roy, and a manage win a vira, of H. Fischer. These works are distinguished by great life and truth. They are very carefully executed, and in a good style. Honourable Mention. (No. 292, p. 1066),

LUDWIG WICHMANN, a pupil of Gottfried Schudow, LUNWIG WICHMANN, a papel of GOTTIFED SCENDER, A Young Maiden in the act of filling her pitcher with water. Cast in hronze, and tooled, from the model of the original, in the foundry of Count Liusided, at Lauchammer, in Saxony. This figure is distinguished by brunty iff proportions, good anatomy, and careful esecution. The Jury were, however, precluded from noticing it, because it was not exhibited in the artist's name, but

2. Sculpture on a small Scale.

in that of the foundry where it was cast,

(a,) in Metal.

Berlin.

The Shield of Faith. This work was a present from The approbation which it has received proves that. His Majesty the Kiog of Prussia to His Royal Highuess

the Prince of Wales. Though it belongs properly to Class XXIII., and has received a Council Medal from the Jury of that class, it is so exquisitely wrought, and the design is of so high an order of art, that I feel myself compelled to offer a few remarks on it here. In the execompetied to ofter a tew remarks on it here. In the exe-cution of this work the taleuts of several most distin-guished arists have been most felicitously combined. The architectural portion of the design is due to the Privy Councilor and Director of Architecture, Stifer, All the groups of figures are modelled from drawings by Cornelius, whose rich and fertile genius has here exressed in truly artistic language the cardinal idea of the Christian Faith, and happily combined with this principal motive an allusion to the immediate purpose for which the shield was executed.

The designs were modelled in low relief by the sculptor, A. Fischer, in a most masterly manner, and with a true perception of the principles of Piastic Art. The reliefs were then moulded, and the casts from them finally chased and tooled with consumnate skill, by the engraver,

A. Mertens. The figures of the twelve Apostles, which are from the designs of Cornelius, were beautifully cut in onyx by the distinguished gem-engraver, Calandrelli, who has long resided in Berliu; the fine enumels and ornamental work are executed by Klossauer, jeweller to the Prussian Court. The Council Medal awarded to this shield is presented to His Royal Highness the Prince of Wales, as its Exhibitor

J. WAGNER and Sons (840, p. 1006), Jewellers to the Court of Berlin. An ornamental piece of plate to serve as a fruit-dish in silver embossed work. This, like the preceding work, belongs in strictness to Class XXIII., in which it has received the Council Medal. I eannot. however, pass over in silence a work which shows to what perfection this class of art has been brought by the silversmiths of Berlin. In the whole design there is silversunths of Berim. In the whole design there is great hearty of form, and much invention is displayed These rein the subjects with which it is decorated. in the subjects with which it is decorated. I nese re-present the successive stages in the development of

civilization The first scene represents the simple characteristics of that primeval age which is still engrossed in supplying the mere physical necessaries of life, when hunting, fish-ing, and the tending of flocks and herds, are the only occupations of man. This forms the pedestal of the vase; round the columns a more advanced civilization is represented by figures, with the symbols of tillage, borticulture, and the vintage. In the reliefs upon the body of the vase, which are still unfinished, we have the characteristics of a still higher stage of social refinement; mining, commerce, pavigation, and the arts and sciences generally, are here represented figuratively.

As the apex of the whole composition, we have the genins of light overcoming a snake, designed to symbolize the highest form of civilization, when man has arrived at the government of those worst enemies, his own passions. Both the detached figures and the groups in relief which develope this train of ideas are disposed with admirable judgment about the vase; they are also executed with great knowledge, and a masterly finish of detail.

In the fruit, flowers, and foliage, which form the

subordinate ornaments, the combination of a close imitation of nature with a very good style, deserves the greatest praise. It may, however, be noticed as a defect, that the mass of the figure of the genius is somewhat too large, and that his wings appear ill set on, as if not originally united to his body. It is to be regretted that another Berlin artist, equally distinguished for his embossed work, M. Netto, contributed nothing to the Exhibition

JULIUS FRANZ. (1, Zollverein, 293, p. 1066). Two Victories modelled by this artist, from the figures by Rauch, on a reduced scale, of about two feet in height, east in broaze, and tooled by Fischer. These works are remarkable for the serupalona accuracy of their exeention.

J. Bennuard Armoen. Four medallion portraits east in hydre by this artist deserve praise for the truth of the general conception; but the execution, though always

careful, is occasionally somewhat feeble, and the treatment too picturesque. Hunourable Mention. (No. 309, p. 1067.)

(b.) Medals.

K. Fisches, Medallist of Berlin, exhibits nine medals. In the design of these, both obverse and reverse, good taste and feeling for nature are combined with correctness of style in the treatment of low relief, and a very careful and conscientious method of execution

The medal struck in honour of Alexander von Humboldt, as the anthor of Cosmos, is specially worthy of

mention. Prize Medal. (No. 281, p. 1064.)
C. Prizeres, Chief Medallist to the Cont of Berlin, exhibits 22 medals. These show a very careful execution, but the overcharged character of tho forms, which are sometimes too full and heavy, is at variance with the true laws of this branch of art, Honourable Mention. (No.

286, p. 1066.) The works exhibited by the ROYAL IRON FRUNDRY OF BERLIN full under Class XXII., and have there been rewarded with a Council Medal; they belong, however, so completely to the Province of Art that they deserve some notice here. The admirable taste shown in the ornaments of these works, and the good style of the sculptures, prove the extensive and abiding influence of the immortal Schinkel in this establishment. Among the works which specially deserve notice are, a large inlaid with silver and ornamented with a design by Hesse, chief architect of the Palace, after Thorwaldsen's Triumph of Alexander, and two stands ornamented in a similar style with small groups. (No. 271, p. 1064.)

B. GRAPHIC REPRESENTATIONS ON PLANE SURFACES.

Designs for Topestry. This kind of work has been more extensively practised

and brought to a greater perfection in Berlin than in any other place. Among the different designs of this elass, those of M. Grünthal deserve special notice for their general good taste. Hononrable Mention. (No. 166, p. 1057.) Lithochromy.

WINCRELMANN and Sons, Berlin. The specimens of Lithochromy exhibited by these artists are among the Latinonromy exhibited by these arcisis are among the most perfect that have been produced. By the employ-ment of a number of stones for the same impression, a ment of a unimper of stories not the reaching agreat variety of tints has been obtained, so that the most complicated objects, and particularly architectural orments, can be represented with all that refinement of gradation which they present in a perspective view. The grauation waste ties present in a perspective view. The most remarkable specimens are the views of the Castle of Orianda, designed by Schinkel for the Empeor of Russia, and several of the Plates in a magnifecent work on Architectural decoration, by M. Lewis Grauer, of London, Considering the excellence of these lithochromes, their price is proportionately moderate, which is an additional merit. Prize Medal. (No. 306, p. 1067.)

C. ARCHITECTURE,

J. C. Boysche, of Magdehurg. A model of the Cathedral at Magdehurg, of considerable dimensions; also a model of the beautiful fountain at Nuremburg. works are accurate in their general proportions, and the details are faithfully and earefully worked out. A model for another fountain is very neatly executed, and the design is pretty and original. Prise Medal. (No. 785, p. 1094.)
To this artist the Jary have also made a money award

of 30% sterling.

II. BAVARIA.

A. SCULPTURE AND WORKS OF PLASTIC ART. 1. Sculpture on a large Scale.

The Munich school of sculpture owes its importance to Schwarzhalen, whose untimely death in the flower of his years we have to deplure. The number of highly imaginative designs which the fertile invention of this artist has drawn from ancient mythology, from the middle nges, and modern times, has justly earned for him a last-ing fame. At the Exhibition he was represented only by a small number of his works. Though in the statues of Queen Libussa and of King George Podiehrad of Bohemia, east by Miller, of Munich, from Schwanthaler's models, the imaginative conception and noble proportions of the figures are well worthy of this great artist, they afford but a very imperfect idea of the whole range and compass of his genius. As they were not exhibited in the name of the artist, they could not enter into competition for a

It is to be regretted that the distinguished sculptor WIELMANN contributed nothing to the Exhibition JOHN HALBIO, of Munich. (2 Zollv., 90, p. 1102.) A Colossal Lion, cast in one piece by Miller; part of a group representing Victory in a Chariot drawn by Four Lions, and designed to be placed on the triumphal arch at The motive of this work is good, but the form is too heavy and clumsy. This overcharged appearance may perhaps be partly explained by supposing it to be calculated for the height at which the figure is to be

placed J. LEER, of Munich. A Young Girl looking at a Nest full of young Cupids, which she holds in her hands. This figure shows nutrete in its conception, and is carefully executed in marble. Hononrable Mention. (Ibid.

89, p. 1102.) 2. Sculpture on a small Scole.

M. Hagen, of Munich. A large Ivory Cup, on which are sculptured figures of children playing, in the style of Finningo; in a very good style, and executed with great care. Honourable Mention. (83, p. 1102.)

B. GRAPHIC REPRESENTATIONS ON PLANE SURFACES.

1. New Processes of Painting

J. N. vox Pocus, Professor in Munich, has invented a new mode of wall-painting, called stereschrony, which has many advantages over the freseo method which has been so generally adopted for walls. By the new process, the surface can be retouched to any extent, as in the case of an oil-painting, while it possesses far greater durability, or an out-painting, while it possesses far greater durability, heing protected by a varnish from the effect of exposure to the weather. A figure painted by M. Muhr, a pupil of Kaulbach, exhibited as a sample of this process, affords good proof of its merit. Prize Medal. (Ibid. 91, p. 1102.)

2. Enamels on Porceloin and on Metal. OTTO WUSTLICE, of the Fine Arts Establishment of

Schmidt, of Bamberg. A miniature of Charles IX. firing upon the Huguenots, on the night of the Massacre of St. Bartholomew, after a picture by Baron Wappers, of Brus-sels. This miniature is remarkable for its truth, its force and transparency of colouring, the goodness of its general tone, and its careful execution. Prize Medal. (Ihid. 92, p. 1102.)

3. Pointing on Glass.

STEPHEN KELLNER, of Nuremberg. A reduced copy of the celebrated painting by Volkamer, in the Chrich of St. Laurence at Nuremberg. In this work, which is executed with the greatest enre, the colours and every detail of the original picture are faithfully rendered. Prize Medal. (Ibid. 86, p. 1102)

4. Vorious Processes of Printing.

FRANZ VON KONELL, Professor at Munich, exhibits FRANK VON KOMELL, Professor at Munied, exhibits a new mode of multiplying Indian ink and other drawings, by means of copper-plates deposited by galvanic action: the investion is hence called galvanography. The process is as follows:—The drawing having been first executed either with encaustic colours. or with lithographic chalk, a plate of copper is preci-pitated upon it by galvanic action. By the contact of the particles of metal with the colours or chalk drawing, the plate receives, during its formation, an actual impression of the delineated surfaces, the lines being indented

on the copper as if by the ordinary process of the burin. The plate, thus cograved by galvanie agency, becomes a matrix capable of yielding other impressions.

F. HANTSTÄNGEL, of the Lithographic Establishment of Munich (Ibid, 85, p. 1102), has exhibited two plates as samples of this process; the matrix or plate impressed by Galvanography, and the patrix, or impression taken again from this plate. An impression in paper, showing the result, is added. These specimens are remarkable for the force, clearness, and evenuess of the print. Honourable Mention,

III. KINGDOM OF SAXONY. A. SCULPTURE AND WORES OF PLASTIC ART.

Sculpture on a lorge Scale.

ERNST REETSCHEL, of Dresden. This distinguished artist, one of the ablest pupils of Ranch, exhibits three works, the varied character of which shows the versatility of his taleuts. 1. A group of the Virgin weeping over the body of our Saviour, east in plaster, from a model executed for His Majesty the King of Prussia. In the figure of our Saviour, announiend truth is combined with nobleness of form; the countenance has a fine dignified nobleness of form; the countenance has a me digunite-character; its mild transfigured expression preclaims the triumph over the agenties of death. In the Mary, the triumph over the agenties of death. In the Mary, the has most resigned sorrow of non. The drapery of this figure is admirably composed. The execution is fully worthy of the invention shown in this group. 2. The Angel of Carist, a very noble relief in marble. The angel is represented in the form of a graceful youth, floating in the air, with the infaut Saviour in his arms; two infant angels attend his course. This group has a peculiar charm from the beauty of the heads and figures, the grace of the action, the suddenness of the movement impressed on the fiying drapery, and the masterly yet tender handling of the marble, 3, Love riding on a Panther, whose course he tries to arrest, eagerly grasping his neek with both his hands. This beautiful conception is quite in the spirit of ancient art, and is expressed with great vigour of hand. Prize Medal. (185, p. 1113.)

B. Graphic Representations on Plane Subfaces. Enamels on Porceloin.

HENRICH BUCHER, of Dresden. This artist exhibits a rich collection of miniatures on enamel, of which I will ren conection of miniatures on enames, or which it will only notice here the copy of the celebrated "Christ with the Tribute-money" of Titian, in the Dresden Gallery, in which the character and deep transparent colouring of the original are admirably rendered. The works of this artist are also remarkable for their very moderate price.

Prize Medal. (176, p. 1112.)
GUSTAV WALTHER. The six enamels, after well-known pietures in the Dresden Gallery, exhibited by this artist, are creditable works in this class of art. Honourable Mention. (177, p. 1112.)

IV. DUCHY OF SAXE-GOTHA.

F. E. Hennemeng and Co. A view of the Wetterhorn, in Switzerland, painted on china. This work has con-siderable merit. Honourable Mention. (772, p. 1093.) V WURTEMBERG

A. SCULPTURE AND WORKS OF PLASTIC ART. Sculpture on a large Scale.

L. von Hoffen, sculptor, of Stuttgardt. Casts in plaster from two Arabian thorough-bred horses, in the stud of the King of Wurtemberg. They are represented rearing; ench is held down by a naked attendant. The original groups are executed in marble, and are placed in the groups are executed in marble, and are placed in the garden of the palace at Mretenberg. Good Judges of borses are of opinion that in these works of Hofer the characteristics of a particular breed of horses are very accurately given. (105, p. 119.)

T. WAGNER, of Stuttgardt. The Penitent Mingdalen, a figure in marble. This work is characterised by truth of

expression and careful execution, but the drapery is drawn over the ridge of the leg so as to intercept its outline, in a manner not consistent with the laws of Plastio Art. Homograble Mention, (108, p. 1120.)

VI, ELECTORATE OF HESSE CASSEL.

C. M. Wessuaer's Son je vellen, of Huns., A chemical in gold and silver. The aids of the boul are such in gold and silver. The aids of the boul are such, biols, &c., in admirable tasts, and executed in an aid with the utilities of the silver and referenced the silver and referenced the silver and referenced the silver and referenced the silver and the silver and the silver and the silver of Frincis. The work people belongs to Class XXIII., and has been revealed there with a Consection of the silver and t

VII. GRAND DUCHY OF HESSE DARMSTADT.

C. W. Hert, ivory-curver in Darmstolt. A large goldet, on which is carved in reflect the battle of Armisias, after a design by Lindenschmidt. This work is entitled accurately a superior of the control of the control centure. The introduction, however, of several plates in the relief, and the videout foreelectricings, give to the with the principles of Platici Avi, whilst in some of the foreelectricings, particularly that of a borne, there is a with the principles of Platici Avi, whilst in some of the foreelectricings, particularly that of a borne, there is a p. 1129, 100 of drawing. Honorardic Mention. (15, p. 1129, 1)

VIII. OLDENBURG. Architectural Models.

J. H. Cassteons, of Oldenburg (1, p. 1135). A model of the castle of Oldenberg, correct in its general proportions, and carefully finished, though in the details of the architecture the character of the several members is not accurately rendered. Houourable Mention.

FRANCE

The French have been distinguished for many generations by the great encouragement they have bestowed, as a nation, on the Fine Arts. The French Government, under every change in its outward form, has not failed to regard Art as one of the most important instruments of eivilization; and recognising its great and beneficial in-fluence on the manufactures of the country, has, by the most liberal grants, placed it in a peculiar mauner under the protection of the State. Millions of the national revenue have, in consequence, been devoted to the erection venue nave, in consequence, next nevotres to the execution of great public edifices, and to the purchase of the heat works of native netists. Establishments like that of the Gobelin Tapestry, and the Severs China Manufactory, or the Ecole des Arts et des Métiers, have been not only founded but maintained by the State at an immense cost. In consequence of this encouragement on the part of the Government, the French school of Art has been most fertile io its productions; many branches of art have been brought to a rare degree of perfection, and the diffusion of an improved taste has exercised a most beneficial influence on a variety of trades and haudicrafts. By these means Paris has become an universal market, not only for the Fine Arts themselves, but for most of the branches of industry to which they are in any way allied.

A. SCULPTURE AND WORKS OF PLASTIC ART.

1. Sculpture on a large Scale.

During the first years of the French Revolution, commencing with 1789 ouwards, a reaction against the style of art, previously esteemed, was brought about by the painter David. This movement was followed up by the sculptors Chaudet and Bosio, who devoted themselves to

a diligent but cold imitation of the master-pieces of ancient Reman sculpture,

At a liner period, the style of many scalptons was directly by the paints bettagerous unforces of Custon a, a factor of the paints bettagerous unforces of Custon a, at a liner period still the influence of the best Greek Art has been flet in deep French as in other pariety enders enclosed, as the period of the property of the control of the period o

hate is any work.

J. Passinas. Member of the Basiletter, Phryse (1407, pp. 1407, pp.

ports transmission a group (Ibid.), east in bronze, of a crontribin a group (Ibid.), east in bronze, of a crontribin y tunes conversing with a Capid, who leasn against her. There is great originality in the conception of this group, and the artist has been for the most part very happy in the selection and treatment of the forms. The execution, however, is not equally careful through-

very happy in the selection and treatment of the forms. The execution, however, is not equally careful throughout. Council Medal for the Phryne. Avourte Denay, of Puris. "Le Premier Berceau."

This same is given by the sculptor to a figure of Exe, seated, with the Thands claspid over on knee, and supporting in her lap her steeping infinits, Calis and Abel. In the form and stitules of Exe there is great leastly, and the contract of the contract

elmany mass. Prize Medal. (46, France, p. 1173; and cell Illustration). G. La Jorgensov, of Paris (Main Avenue East). A Satyr, east in forome, represented after the manner of the ancients, dancing on a wine-okin, in a state of joyens and of the strong, hard mancles, quite correspond with the general Satyr type created by the imagination of the ancient artist. The motion is easy and natural, and the

carefalness of the execution is maintained throughout. Prize Medal.

A. EFEX (1215, Main Avenue, East, p. 1236). Of the three groups exhibited by this artist the most agreeable is that in marble of Hero and Leander, standing mournfully beside each other.

Coin and his Family. The characteristics of a buse, abaudoued asture are admirably expressed in the countenance and coarse clumsy limbs of Cain, which are very carefully studied from the life; in plaster.

The allegorical group (in plaster) of the City of Paris inpoling heaven to take away the plague of Cholera, is a less agreeable work, on account of the manner in which the subject is treated. The City is represented as a scated female figure, with an old man and a youth expiing of the pestilence, one on each side. In these figures the moment of death is expressed with wonderful truth. This work is a specimen of that class of art which, seeking to act on the feelings through the representation of more physical suffering, may be called the Revolting, n style which appears to be little cultivated or admired, except in France.

Toese works all show great knowledge on the part of the sculptor. Prize Medal.

J. Clestroga, of Beaugon (1709, p. 1258). chante, who is rolling on the ground in a state of drunken excitement. This figure is remarkable for the masterly chiselling of the marble, the great knowledge of anatomy, and the beauty of the countenance; but these excellences do not sufficiently excuse the sculptor for having in this work allowed his imagination to be perverted and degraded to the service of n low sensuality. Moreover, the treatment of the hair is at variance with the principles of a good style, and there is a great want of taste in the arrangement of the folds of the drapery. The Jury consi-dered this subject to be of an objectionable character, but have made Houourable Meution of the excellences pointed

J. M. RAMUS (1419, p. 1244). Cephalus, tenderly supporting in his arms the dying Procris. This group is, in its leading lines, very happily composed, and shows in the forms much knowledge of nature; but the modelling is not in a sufficiently large style, and is not sustained throughout. Prize Medal.

M. Pascat, of Paris (1660, p. 1266). A group, in marble, of a monk holding out a crucifix, which a little boy is eagerly kissing; a little girl stands by, steadfastly gazing at him. There is a charming feeling for nature in the expression of the heads: hat the general composi-tion, and particularly the drapery, may be termed rather Picturesque than Plastie in style, and, with the exception of the nude forms, the whole is only sketched out in the marble. Honoarable Mention.

C. Corder, of Paris (460, p. 1200). The head of n pegro, cast in bronze, by this artist, is a true example of characteristic portraiture; the conception is full of life, the execution most masterly, and well sustained through-

out. Honourable Mention.

JEAN DENAY, of Paris (573). A group of a young hunter, rushing forward to despatch a stag, pulled down by a hound. The hunter is naked, and the whole type is conceived in the spirit of ancient art. This group, from the natural manner of the action, forms a very pleasing composition. The hunter and the animals are modelled with great knowledge, and a good style is shown in the execution, Prize Medal, (Main Avenue East,)

Faarin, of Paris (1235, p. 1236). This artist, the most celebrated sculptor of animals in France at the present day, contributes to the Exhibition two cagles with n wild goat, which they have slain, a greyhound, another hound, life size, and several animals on a smaller scale, all in bronze. These works are fully worthy of the artist's reputation. The general conception is most spirited, the details of nature are most faithfully rendered, and the treatment throughout, particularly of the plumage and the skins, is most careful, and in a very good style. Prize Medal.

A. Lechesne, of Paris (573, p. 1205). Two groups, in aster. of does and children. In one is represented a plaster, of dogs and children. In one is represented a dog rescning a child from the attack of a snake; in the one reseming a custo from the attack of a smake; in the other, which forms the sequel to the preceding, the snake lying dead, the dog exhausted, and the child full of joy and gratitude for its researc. These works are very re-markable, from the extraordinary truth and spirit in the modelling and expression of the dog's head. The form of the child, on the contrary, is too swollen and coarse; and in the representation of the shaggy coat of the dog. the execution is too minute, and not in a legitimate style,

In another group, a woman is lying on the ground asleep, or denit. Above her hovers an eagle, about to entry off her child. Here, again, the treatment of the bird is very masterly, and by far the best part of the work. Prize Medal,

BONNASSIEUX, of Paris (64, p. 1174). brouze, representing Cupid, as a youthful figure, chipping the tips of his own wings; standing beside him is a dog. The form of the Capid is very graceful, but the head is too directly copied from the antique type.

execution is very unequial; the dog, in particular, is very carelessly modelled. Honournhle Mention, A. G. FORDINOIS (1231, p. 1235). A large sideboard, ornamented with figures and dogs, on a large scale, carved in wood. In these the artist has shown such a happy invention, and such power of execution, that this work must

be considered to rank as sculpture, and cannot be passed without a notice here, although it belongs to Class XXVI., and has been rewarded in that Class with a Council Medal. It may not here be out of place, after this notice of the works of English, French, and German artists, to compare briefly the intellectual tendencies which these three

great nations severally manifest in their schools of seuln-In each of these schools, though in the case of England only within the present generation, Greek sculpture has

been acknowledged as the standard by which all creations of ideal art must be judged. The English school has, on the one hand, sought to

attain the qualities of grace and loveliness of form; more recently this school has also aimed at strength and manliness of character, chiefly in strong action. The French have principally turned their attention to the representation of sensual heanty, to the tender feelings called forth by the relations between the sexes, to other forms of the Sentimental, or to the style which may be designated as the Revolting.

Finally, German art has been especially devoted to the representation of deep religious feeling, or of calm, idvilie scenes; it has also endeavoured to treat the most stirring oments of real life in a grand and impressive manner, Of the works contributed to the Exhibition by these three nations, those most distinguished in the foregoing notices may be fairly cited in proof of the socress with which each school has followed out its peculiar bent.

2. Sculpture on a small Scale. (a.) In Metal.

Among the French works in silver analogous in style to the productions of Veclite mentioned before, is a service of plate in the taste of the sixteenth century, executed by FEICHER, and exhibited by FROMENT MEU-RICK (1720, p. 1258). This work is the property of the Duke de Luynes. A Prize Medal has been awarded to it in Class XXIII. The French department of the Exhibition displayed an

extraordinary abundance of small groups of human figures and animals, and other small bronzes.

and animals, and other small bronzes.

Many of these are from the designs of distinguished artists, among whom may be noticed, Pascat (1660, p. 1266), who contributes a charming group of three children with hunches of grapes, designed for a dinner service, Fratux (1235, p. 1296), and also Mixá (630, p. 1298), who works in the same style as Fratin. In other bronzes we find copies from the works of cele-

brated sculptors, such as Rude, Duvet, and Pradier; these are often very well executed. A Daphnis and Chloc, after Gaylard, deserves special notice. But a great number of these specimens do not rise above the level of very pretty ornaments, executed without much style, and a notice of them here would occupy too much space. As the French medallists sent no specimen of their works to the Exhibition, no mention has been made of them in this Report, though the skill of many of these artists is very generally acknowledged.

(b.) Sculpture in Ivory.

L. LAUTZ, of Paris (295, p. 1199). A great cup, ornamented with reliefs, representing a battle scene. The composition of these is too picture que, and not treated in accordance with the principles of Plustic Art; but it must be admitted, that this is a work of extraordinary merit in the drawing and execution. Honourable Mention,

(c.) Sculpture in Wood

M. J. LIENARD, of Paris (1326, p. 1239). A Boar-hunt, carved on a clock-case. Although this work is treated in a manner atterly at variance with the principles of Plastie Art, it is nevertheless a perfect masterpiece for truth of imitation, drawing, and execution. This artist has re-ceived from the Jury of Class XXVI, the Conucil Medal, especially for a richly ornamented clock-case, but his merits have been also acknowledged in Class XXX, by the award of a Prize Medal.

The process invented by Mr. A. Collas (1709, p. 1258), for reducing sculpture by machinery, which has been already referred to in the opening of this Report, must be noticed here. Prize Medal.

B. GRAPHIC REPRESENTATIONS ON PLANE SURFACES. 1. New Processes of Painting.

It is now some years since a process of painting on lava has been perfected at Paris, chiefly by the exertions of the celebrated architect Hittorf. This kind of paint-ing is as durable as that on porcelain, and is barnt in the same manner. A copy of Raphael's picture in the Louvre, called La Belle Jardinière, executed by J. Dr.vens (818, p. 1219; was contributed to the Exhibition as a specimen of this process. It is very carefully and faithfully copied, but the flesh is rather heavy and deficient in transparency, Prize Medal,

2. Enamels on Porcelain and on Metal. Nowhere in Europe has the art of painting in coamel

been earried to such perfection as in the celebrated manufactory of Sèvres. The works of this establishment are distinguished not only by the extent of the cannelled surfaces, but also by the perfection with which facsimiles of celebrated pictures are executed, the drawing and colouring of the original being preserved with marvellous The Jury has therefore awarded a Prize Medal tu M. DIETERLE (1369, p. 1241), as the Director of an establishment where such great results have been attained. Although it is to be regretted that the celebrated Constantine contributed no specimens of his works, the Exhibition contained a great number of paintings of the greatest merit

Madame A. DUCLUZEAU, of Paris (1369, p. 1241). This most distinguished artist, whose recent decease I regret here to announce, contributed masterly copies of the fol-lowing pictures in the Louvre:—a. La Vierge au Linge, by Raphael; b. The portrait of Vandyke, by his own hand; c. A portrait of a male personage, recently ascertained to be a masterpiece of Johann von Calcar; d. The portrait of be a masterpiece of Johann von Calear; d. The portrait of Her Majesty Queen Victoria, after Winterhalter (96, p. 103). Jaconaux, of Paris (271, p. 1189). A Flower-piece, after Jan Van Huysum, thy his artist, is a perfect master-piece. Another flower-piece, after Von Spandonck, has also grout merit. Prize Medal.

A. BERANGER, of Paris (1369, p. 1241). The copy of a Portrait by Rubens, in the Louvre, and one of His Royal Highness Prince Albert, after a portrait by Winter-

halter (97, p. 109). Prize Medal.

Madame P. Lausent, of Paris (1369, p. 1241). Three remarkable enamels on copper, two of which were after Raphael, the other a Venus, were exhibited by this skilful

artist. Prize Medal. Madame Jacoror, of Paris (1369, p. 1241). This celehrated artist, now far advanced in years, contributed a copy of the portrait of Raphael, after the picture in the Portrait Gallery at Florence. The original is rendered

with great truth. Prize Medal. with great trius. Frace pressat.

Bonner, of Paris (1369, p. 124t). St. John enamelled on iron, of great merit. Prize Medal.

Schult, of Paris (1369, p. 1241). Paintings on two

orcelain vases, and on a table, very masterly in execu-

. Prize Medal. Mme, Turgan (1504a, p. 1248). A Holy Family, after Raphael, of remarkable merit. Honourable mention. MARIETTE DE CHARSAGNE (1354, p. 1251). A copy of the celebrated picture, by Horace Vernet, the meeting of Michael Angelo and Raphael, exhibited by Boyer, of

Paris. In this work every detail of the original is faithfully rendered. Honographe Mention. HAMON (1369, p. 1241). A casket of metal with figures, en grisnille. In this work there is a successful revival of

the process fur which the Limoges school of enamel was so distinguished in the sixteenth century. Prize Medal,

3. Painting on Glass. (a.) Ecclesiastical Style.

ALFRED GERENTÉ, of Paris (231, p. 1187). A window ALFRED GENERIT, of PRIN (231, p. 1187). A window in the style of the twelfth century. In the figures, which represent the history of Sampson, and particularly in the ornaments, the style of the period is rendered with extraordinary mastery and truth. Prize Medal.

A. Lesson, of Paris (265, p. 1285). In some windows.

in the taste of the thirteenth, fifteenth, and sixteenth centuries, the artist has given the style of each period with great knowledge and care. Honourable Mention.

(b.) Pictorial Style. MARKHAL and GUYNON, of Metz (329, p. 1193). The

sick of the plague receiving the Eucharist. The charac-teristics of a picture, keeping, truth of drawing, and expression, are very successfully rendered, and the advantages of a material admitting of such force and transparency of colorns as glass, are turned to the best account. These excellences are also exhibited in a very high degree in a male portrait. Prize Medal.

4. Islaid Works in Metal.

J. ROYCOF (1689, p. 1257). Different kinds of arms, such as pistols, inlaid with gold and silver ornaments, in very refined taste, and executed with rare mastery of d. Prize Medal.

5. Designs.

(a,) For Woven and Printed Fabrics. E. Laroche (291, p. 1190). A volume containing many designs for shawls, barbges, and muslins. The patterns show great taste and adaptation to the materials,

and are admirably executed. Prize Medal. BERRUR, BROTHERS (55, p. 1174). This establishment is one of the largest manufactories in France, and the designs for shawls which it exhibits have most remarkable merit both in regard to the patterns and the colours. The introduction of small landscapes, however, in some of these designs, is an infringement on the principle which has been already stated in this Report, that the pattern must not disturb the idea of flatness in the sur-

face. Prize Medal A. Courpe (1566, p. 1231). Designs for shawls and other stuffs. The execution of all these is very masterly, and those for shawls are in a very good taste. The others are very deficient in this quality. Prize Medal.

oners are very deneted in this quanty. Prize Medal.

J. Christopherax (1146, p. 1233). Some of the designs for cotton and calleto by this artist show a very happy invention, and are executed with very great skill. In his designs for other materials the execution is equally skilful, though there is a want of taste. Prize Medal. The fullowing artists deserve notice both for the taste

and execution of their designs :and execution of their designs:—
F. DIDISK (820, p. 1219) and MEYNIER (638, p. 1208), both of Paris, in their designs for shawls; NATE and CO. (625, p. 1207), and Barau (72, p. 1175), in their designs for cottoms; E. Pican (347, p. 1194), in his designs for ealices; J. II. MÉRATE (631, p. 1208), in bis designs for ealices; J. II. MÉRATE (631, p. 1208), in bis designs for lace. All these have obtained Henournhie Mention, and the last a Prize Medal. (Class XIX.)

(b.) For Painted Windows,

N. A. GALIMARD, of Paris (228, p. 1187). In these designs the artist has been very successful in representing figures according to nature, and under the conditions of Architectonie style. Honourable Mention.

 The Government Manufactory of Gobelin and Beauvais Tapestry (1367-68, p. 1241). This celebrated establishment, which has produced

such a number of copies of celebrated pictures, contributed two specimens of tapestry to the Exhibition. One of these is a copy of Raphael's freeco in the Farnesina, in which Psyche is represented carried through the air hy Geuii, and carrying the vessel which, at the behest of Venus, she has brought from the nether world. The other piece of tapestry is a copy of the celebrated picture hy Horace Vernet, representing Ali Pasha looking on at the massacre of the Mamelukes, who, at his command, were shot by his soldiers. In both these copies not only is the general effect of the original picture faithfully rendered, but the intention and feeling of the artist are preserved in a degree which could hardly be expected, when we remember that the process by which these copies are executed is a purely mechanical one. (Conneil Medal, jointly with Class XIX.)

7. Different hinds of Printing, such as Lithography and Lithochromy.

R. J. LEMERCIER, of Paris (558, p. 1205). This artist exhibits a number of lithographs, which from their force, depth of shadow, and fine gradation of tints and general tone, must rank among the most remarkable specim this art which have yet been produced. Prize Medal.

Lithochromy,

ENGELMANN (192, p. 1183). This celebrated estab-lishment has well sustained its reputation by the series of admirshly executed specimens of lithochromy, which it exhibits.

Printing in Colours from Wood Blocks.

G. SILBERMANN, of Strasburg (374, p. 1194), is the inventor of this node of printing, and the coloured impressions from wood blocks exhibited by this artist are in every way remarkable. Prize Medal.

Although the facsimiles of the illuminations and initial letters of ancient MSS., exhibited by the Count AUGUSTE DE BASTARD (1717, p. 1258), are worthy of the greatest admiration on account of the extraordinary truth and skill with which they are executed, yet these works ought hardly to have been admitted into the Exhibition, as most of them were finished by hand. Here ought not to be omitted the name of Mr. C. E.

CLEBORT, of Paris (799, p. 1219), for his designs gene-rally, and his exhibited works in ornament. Prize

AUSTRIA.

A. SCULPTURE AND WORKS OF PLASTIC ART. Sculpture on a large Scale.

The only parts of the Austrian dominious from which large works of sculpture have been contributed are the

large works of sculpture have been contributed are the Italian provinces, and especially Milan. In these works may be remarked a strong tendency to Realism. G. Syraxata, of Milan (718, p. 1043). Ishmuel. This name is given by the artist to the figure of a boy lying on the earth, expiring of thirst. The dry and meagre forms, characteristic of this period of boyhood, are rea-dered with a truth which borders on the expulsive. The dered with a truth which borders on the repulsive. The execution is masterly. The head, which is evidently studied from some type quite foreign to the subject of this work, conveys an expression of exhaustion which is almost painful. In the representation of this subject by painters, an angel bringing help to ishmael is always introduced, and from the absence of this figure the general impression produced by the wark of M. Strazza is most painful, and unrelieved by any mitigating cirenmstance. Prize Medal

R. Monvi, of Milan (746, p. 1044). Eve after the Fall, arrived at the full consciousness of her crime. This figure, which is in marble, is appropriately conceived; the motive is pleasing, and the execution is very careful. It has consequently obtained from the Jury a Prize Medal.

This figure was not so generally admired by the public In ingine was not so generally someter of the part of the same artist, representing a girl kneeling, with a thin veil thrown over her face, but the preference was not rightly given. Though extraordinary skill is shown in the execution of this veiled figure, trae judges of art must always esteem it a mere specimen of dexterons work manship, and they cannot but think, that in thus deviating from the undisguised representation of the buman features, the artist has renounced the only means by which beauty, character, and expression can be distinctly rendered in the countenance,

A. Galli, of Milan (711, p. 1043). A youthful female figure, to which the sculptor has given the name of Susanna. The forms are pleasing and the movement protty, and the work is very carefully executed in marble. But without the addition of the two Elders it would be

impossible to recognize the subject. Prize Medal, A. Sanotorgio, of Milan (722, p. 1043). A colossal hast, in marble, of the poet Vincenzio Monti; the conception of this work is very spirited, and the execution most masterly and careful. Honourable Mention.

1. Fraccasolx, of Verona (710, p. 1043). David in the act of slinging the stone at Goliath. The motive of this figure is very spirited, but a little strained; the features have a noble expression. The youthful character of the head does not accord with the rest of the body, in which the muscles are too strongly marked. artist also exhibits a statue of Achilles wounded in the

artist and extreme a season of common theol. Prize Medal.

L. Marchan, of Milan (716, p. 1043). Enrydice. In this figure, which is of marble, there is something very pleasing in the general expression, but the execution of the common theory of the desired. Honournble Menthe details leaves much to be desired. Honourable Men-

B. GRAPHIC DELINEATIONS ON PLANE SURFACES. Examel Painting

Noor (13. p. 1033, Painter in the unperial Procedure Manufactury of 1033, Painter in the unperial Procedure ture in the Imperial Gallery at Vienna, attributed to Raphael. In this copy the forems are rendered with tolerable fidelity, but the pale tone of the flow try tolerable fidelity, but the pale tone of the flow try the original picture. The artist has sacceeded better in a flower piece, in which the colours of the flowers are most carefully rendered in all their original truth and force. Honourable Mention,

Painting on Glass.

G. BERTINI, of Milan (737, p. 1044). A design, in the centre of which the poet Dante is represented scated: on his right hand is Matilda, on his left Beatrice. This picture is set in an architectural frame, in the Gothic style. It is very seldom that we find in glass painting so much artistic expression as has been attained in the figures, more especially the female figures, in this work; and their effect is heightened by the remarkable harmony of the deep soft colonring. But, an the other hand, the architectural frame is utterly at variance with the taste and principles of construction in Gothic architecture, and two great black spaces, in the upper part of the picture, have a very disagreeable effect, from their contrast to the rest of the design, which is meant to produce the imsion of a picture. From the arbitrary mixture of the Architectonic and Picturial systems of glass-painting in this work, its effect as a whole cannot be agreeable to the best judges. Prize Medal.

P. BAGATTI-VALSECCHI, of Milan (616, p. 1038). heroine of Manzon's celebrated romance, the "Promessi Sposi." As a specimen of course principle. minting on glass, representing Lucia Mondella, the Sposi." As a specimen of cenre painting on glass, this work is very remarkable in drawing, colour, general effect, and manner of execution. Hosouruble Mention,

Lithochromy.

The IMPERIAL PRINTING OFFICE OF VIENNA (362, pp. 1025-28). The work, "Paradisas Vindobonensis," exhibited by this establishment, contains a great number of lithographs of flowers and plants, which are represented in form, colour, and every other respect, with remarkable truth to nature. Prize Medal.

The Italian sculpture of the present day cannot be described as possessing any one general character; some of the modern school still imitate the style of Canova, as for instance, Bienaimé; others again, like Tenerani, follow rather in the steps of Thorwaldsen; others, like Marochetti, have devoted themselves, in conception and representation, to the romantic school,

SARDINIA,

D. W. Baron Marochetti (76, Outside West, p. 118). This arrist, though educated in France, and at settled in England, is by birth a subject of the King of Sardinia, so that it is most proper to place him under the latter country. He exhibited a colossal equestrian figure of Richard Cour de Lion, modelled in plaster, and bronzed, and placed in the open air at the west end of the building. Richard is represented in mail, mounted on a fine charger, The frank and noble conception of the chivalrous king, holding up his sword in his right hand, and the spirited action of the horse, make this a very remarkable work. In some parts, however, of the modelling of the horse there is a want of knowledge. The hind quarter and hind legs, especially, have rather a lame appearance, and the execution of this part of the horse is very imperfect; the disposition of the veins particularly is altogether arhi-The artist has, however, exhibited within the huilding a horse's head finished in detail, and from this sample we may see that certain farther modelling may much improve the general effect, Council Medal

Nicolas Lanny, engraver at the Royal Mint of Tarin, (60, p. 1304). This arrist exhibited nine microscopic dies of coins as examples of a process invented by hun-self, by which dies may be reduced with extraordinary accuracy to a scale, the minuteness of which is hardly

Though the inscription and design on these dies can only be discerned by the aid of a very powerful microscope, the details are rendered with extreme fineness.

TUSCANY.

Among the works exhibited by this country are a Bacchus by NENCINI (115, p. 1298), a Psyche by Fraccia (117, p. 1299), and a Dying Gladiator by Cos-toll, all in marble, These three works, though not rota, all in marble. These three works, though not without merit, must be reckoned of very subordinate rank, when we remember the great celebrity of Tuscany in art; they have, however, received Honourable Men-

Sculpture on a small Scale.

A wardrobe and jewel-casket, by Bannetts, of Siena (91, p. 1298), are, both in taste and execution, most remarkable examples of the rich style of decorative carving of the sixteenth century, commonly known as the cinque cento style; though these works, therefore, have already obtained a Prize Medal, in Class XXVI.,

they cannot pass annoticed here.

L. Bigorri (95, p. 1298). The ornaments carved in ivory by this artist show a good taste, and are carefully executed. Honourable Meution.

GRAPHIC DELINEATIONS ON PLANE SURFACES. Islaid Works in Pietra Dava

This kind of art has been carried to great perfection in Tuscany, and its cultivation there for so long a period

has supplied most of the palaces in Europe with works in Pictra Dara, which rank among the finest examples of decorative furniture. No first-rate specimen was contributed to the Exhibition; there are, however, several table-tops by G. BIANCHINI (119, p. 1299), which must be considered very remarkable works, on account of the taste displayed

in the composition of the flowers and leaves, and the care bestowed on the execution. They therefore received a Prize Medal from the Jury of Class XXX., as well as from that of Class XXVII.

ROME.

Sculpture on a large Scale, It is to be regretted that the most distinguished artists of Rome, and especially Tenerani, the greatest living sculptor of Italy, sent no specimens of their works to the

Exhibition

Two groups, of a little girl with a dog, by G. M. BEN-

ZONI (16, p. 1286), may be noticed here. In one of these the child is represented drawing a thorn out of the dog's foot; in the other the dog, after having killed a snake which was threatening an attack, seeks to awaken the child thus rescued. The motive of these works is attractive, and they are carefully executed in marble, but they are by no means of sufficient importance to be considered adequate representations of the modern school of sculp-

ture of such a city as Rome. Prize Medal.

1. Engra, of Hungary (p. 848). A group in marble, representing an incident in the myth of the Argonauts This composition is not happy in its lines, and the figures are somewhat deficient in character, but the execution is careful. Though this artist is not an Italian by hirth, yet, as he received his artistic education in Italy, this seems to be the most proper place for the notice of his work. Honourable Mention.

Fair specimens of this kind of art, which has been so

much esteemed at Rome, and cultivated with such great results, have been contributed to the Exhibition in a series of cameos, cut ou shells, by the well-known gemeugraver Sauliui. The greater part of these are copied from the most attractive works of the celebrated English sculntor Gibson, Honourable Mention, (24, p. 1286-87,)

This class of art, in which the artists of Rome have so long maintained the first mak, and produced such wonderful results, was far more abundantly and adequately represented in the Exhibition than the other branches of Roman art which we have already noticed.

Bannest (15, p. 1286). A table-top, on which are represented views of eelebrated cities in Italy, such as Rume. Flurence, Veuice, Pisa, &c. These views are arranged in a border round the table; in the central area thus encircled is a representation of the sky. Both in the choice of the subjects of the views, and in the force and refinement of execution, this work is smong the most remarkable specimens of mosaic that have been produced. There is, however, rather a want of taste in the form and colour of the ornaments which compose the outermost border of the design. Although this work has been distinguished by a Council Medal in Class XXVII., I have thought it necessary to notice it here, on account of its remarkable character as a work of art,

The Mosaic Manufactory at St. Peter's exhibits two excellent specimens by Castellini (25, p. 1286). One of these, representing a colossal three-quarter portrait of Pope Boniface II., is an example of the ancient style of mosaic, intended for the decoration of churches, and for distant effect. The other specimen is a half-length por-trait of St. John, by Gnercino. This work shows with what wouderful precision a picture, executed in a period when technical knowledge had been fully attained, may be reproduced in mosaic, with a perfect rendering of the forms, colouring, and general effect.

B. Boschettri (17, p. 1286), of Rome, exhibits two

mosaics for table-tops, remarkable for their taste and execution; these have obtained Hunourable Mention. Awarded Prize Medal.

Three Roman artists in mosaie, Dominico Moglia (21, awarded Honourable Mention, Class XXVII.), the CAVALIERE LUIGI MOGLIA (20, Rwsrded Prize Medal, Class XXVII.), and ROCCHIOLANI (22,- all these at p. 1286), have severally contributed to the Exhibition views of the temples of Pustum, this subject being a favourite one among the Roman mosaicists. These views are executed on a considerable scale. All these artists deserve praise for the truth and careful execution displayed in their works, but the mosaic of Rocchigiani is distinguished from the rest by the force of the effect, and depth and warmth of the colonring. An Honourable Mention has been bestowed on these three artists.

BELGIUM.

In this country, not withstanding its moderate size, there is so general a diffusion of talent and feeling for

tae Fine Arts that they have been more freely developed here than has been the case in other countries far greater here than has been the case in other countries far greater in extent of territory. Hence, within the last twenty-five years, side by side with the flourishing school of paining in Elegium, has grown ap a school of sculptors, among whom are many distinguished names. In she school of sculpture a tendency to the picture-sque, which is in conformity with the whole bent of the nation is arrivantally side of the composition of the co tion, and in a peculiar treatment of the surfaces, in which there is always a certain roundness and fuluess, and sometimes an exaggerated development. In many ideal subjects this treatment has a very attractive effect, but in some of the works of Belgian sculptors the want of a proper feeling for bony structure in the representation of the figure, and the affectation of the motive, show that the signe, and the alternation of the morree, show that the style of Canova has exercised an unfavourable influ-ence on this school. In portraiture the scalptora of Bel-gium have shown great ability; in this branch of art the whole Realistic tendency of the national mind has found

Nearly all the distinguished sculptora of this school sent works to the Exhibition, though in some cases it can hardly be thought that the merits of the sculptor were adequately represented by the specimens he contributed.

A. SCULPTURE AND WORKS OF PLASTIC ART. Sculpture on a large Scale.

E. SHRONIS (464, p. 1166). A colossal figure of God-frey of Bouillon ou horseback, raising the bauner with trey or assumen on nonscours, raising the banner with which he led the Crusadera to the Holy Land. Cast in plaster from the original in bronze, which is placed in the Place Royale at Brussels.

In this work the expression of the head is full of life and animation, the action very emphatic, the execution very careful. To compensate for the optical diminution which causes statues placed in the open air to appear meagre and deficient in mass, the artist has in this group exaggerated the forms both of the warrior and the horse. This departure from nature has perhaps been carried too far, and the principles of Plastic Art have been thus lost sight of in the treatment of the surfaces. It may also be presents two lines which are too parallel, and by no meaus happy.

In his group representing Truth trampling on False hood, the same artist has shown power in the represents tion of delicate feminine forms, and the work is carefully executed. The subject, however, is not indicated with sufficient clearness. Twn figures of boys, one of whom is crying over his broken drum, prove that M. Simonis has also been successful in that class of subjects called "genre," and which are altogether treated in a Realistic manner. Prize Medal. C. A. Frankin, of Schnerbeck, near Brussels (465,

p. 1166). A figure of Psyche moving lightly forward, and bearing a Cupid on her shoulders. The motive of this figure is spirited, the forms are expressed with great tenderness, and the group presents attractions from several points of view. There is, however, in the move-ment of the head of Psyche something affected, and in the style of Canova. Prize Medal. (4:5, p. 213.) G. Geers, of Schnerbeck, near Brussels (466, p. 1166).

G. Gerrs, of Schaerbeck, user Brussels (466, p. 1166). A groop, in which the power of beauty over savage nature is allegorically represented by a bon, who is allowing his claws to be cut by a pretty undraped female figure. This work, of which a cast is exhibited in plaster, is very carefully executed as a whole; the forms of the female figure are very pleasing, though the treatment is rather too soft.

The hust of His Majesty the King of the Belgian

The aust of the Support of the Rug of the Degians, exhibited by the same artist, is very spirited, and is carrefully executed. Prize Medal. (466, p. 213.)
J. Ternatsaccus, of Malines (456, p. 1165). A figure, in marble, representing the celebrated Giotto whan a boy, looking at his first drawing with an expression of Joy. The conception of this work is very spirited, and it is carefully executed. Prize bledal.

C. GEERTS, of Louvain (4:0, p. 1165). This artist, the most distinguished for wood-carving in Belgium, executed the carvings for the new stalls in Autwerp Carleedral. His chief contribution to the Exhibition is a "Coronation of the Virgin," executed in wood. In this work the artist shows a great knowledge of the Gothic style in the motive of the figures, the expression of the bends, and the manner in which the folds of the drapery are disposed. There is, however, samewhat too much of systematic uniformity in the character of the bods and drapery. Prize Medal.

Joszyn Gerrs, of Antwerp (45), p. 1165). "The Faithful Messenger." In the work so entitled the sculptor

ration resemper. In the work of entires the ecopor-has represented a dove perching on the shoulder of u young girl, to whom it has returned. This statue is very pleasing, but is hardly a work of sufficient consequence to give an idea of the distinguished merits of this utist. Houonrable Mention,

J. JAQUET, of Schaerbeck, near Brussels (461, p. 1165). J. JAGUET, of Schnerbeck, near Brussels (461, p. 1165). A group, in plaster, of Cupid asking Venas to restore his bow, which she has taken from him. This work is pleasing, though somewhat affected in motive. The exe-cution is careful, though the development of the muscles, particularly on the back and aboulders, is too strong. Honomerable Meution.

Sculpture on a small Scale .- Medals,

L. J. Haar, of Brussels (441, p. 1165). Thirty-nine Medals, among which a portrait of Rubeus may be particularly noticed. These works show very considerable skill in the class of art in which they are executed. Honourable Mention.

C. JENOTTE, of Liège (447, p. 1165). A series of Medals by this artist are also skilfully executed. Honourable

B. GRAPHIC REPRESENTATIONS ON PLANE SURFACES, Inlaid Works in Metal.

J. Falloise, of Liège (384, p. 1163). A shield, some drinking caps, a vase, an armlet, all in steel, inlaid with drinking caps, a vase, an armier, all in steet, minud with silver. The masterly execution, refined taste, and correct style shown in these works, place M. Falloise in the first rank in the class of Workers in Metal. Prize Medal, (Awarded Prize Medal, Class XXIII.)

SWITZERLAND.

J. Leymann, of Zürich, a bookbinder (257, p. 1282). The model of the Cathedral of Strasburg, executed in cardboard with a penknife. This model deserves special notice, on account of the correctness of the proportions, and the labour and dexterity shown in the execution, Honourable Mention. (Awarded Prize Medal, Class VII.) J. LEEMANN, of Berne * (258, p. 1283). The model of the beautiful Fountain at Nuremberg, executed in wood with the numost truth of detail. Hor ourable Mention

SPAIN. Inlaid Works (a.) In Wood.

PEREZ and Co. (271a, p. 1346.) A manufactory for inlaying wood at Barcelona. A table-top, inlaid with a variety of ornaments, in the centre of which are the Royal Arms of Great Britain. The patterns, with a few exceptions, are in admirable taste, the colouring exquisite throughout, the execution of extraordinary fineness, the most minute particles of wood being employed to express the faintest gradations of colour. Altogether this is a work of the highest rank in its class. Prize Medal,

(b.) In Metal E. ZULGAGA (264 and 264A, p. 1346). The proprietor of an establishment at Madrid for works in metal, from which were exhibited various specimens executed in iron

inlaid with gold and silver, and ornamented with reliefs, It has been already pointed out, in the Report of Mr. Pasizzl, that the model of the Fountain of Nuremberg is executed by the some artist as the model of StrasLung Cathedral, which precedes it. These works are of rare excellence in every respect, both as regards the taste of the patterns and the artistic style of the execution. Among the most remarkable are a clust, worthy to receive the muniments of the proud nobility of Cavile, two pairs of pissols, a contenu de chasse, mud a sobre, Honourable Mention. (Awarded Prize Medal,

THE ROYAL ORDNANCE MANUFACTORY OF TOLEDO (266, p. 1346) exhibits a number of works inlaid in the same namer, mong which may be particularly noticed a dagger. Honourable Mention.

DEVMARK

Sculpture on a large Scule.

It was for this country that the great Thorwaldson embodied his spiritual conceptions in such a number of masterpieces of sculpture, and there are not wanting in Deamark at the present day distinguished sculptors who

follow in his footsteps with greater or less success. J. A. Jentenau, of Copenhagen (39, p. 1359, and see Illustration). Group of a Panther and Hunter. The animal has fastened on the hunter as he is carrying off

one of her cubs; he is about to pierce her with his spear, This group is full of life, and finely conceived; the execution shows great knowledge, and careful minute labour in the details. It should, however, be noticed that the artist has missed the true proportions in the legs of the hunter, which are too short,

Another group by the same artist, "Eve after the Fall," leaning no the seated figure of Adam, has great merit, is just praise is due to him for a bas-relief intended to form part of a frieze; a drawing of the whole design gives a very favourable impression of it. Prize Medal. 11. W. Bissen, of Copenhagen (38, p. 1358). A figure of Orestes in rapid movement, and brandishing a sword.

In this work the conception is full of life, and the momentary character of the action well rendered; the ex-pression of the contenance is noble, the excention careful. Housarable Mention.

Sculpture on a small Scale,

C. G. KLINGSEY, of Copenhages (34, p. 1358). A jewel casket in ivory, ornamented with reliefs, after celebrated works by Thorwaldsen. The artist has shown a highly cultivated taste and correct feeling for style, not only in the general form of this casket, but in the adaptation of the reliefs to so small a scale, and in the architectural ornaments. This work is also to be especially commended on account of the great care shown is its execution. Honourable Mention.

DITESTA

It is to be regretted that Russia has contributed to the Exhibition ao specimen of sculpture on a large scale, although we could here mention two distinguished Russiaa names, that of R. M. Von Lausitz, now residing at Frankfort, a sculptor full of taleut; and the well-knows Baron Kloth, of St. Petersburg, who, in the representation of horses studied from the life, is one of the most distinguished artists of modern times. His groups of horses, with their trainers, at St. Petersharg and Berlin, may be cited in proof of his merits.

Count Turstor, President of the Royal Academy of Arts at St. Petersharg (328, p. 1381), exhibits plaster casts of a series of medallions, on which are represented in relief the jacidents of the successful war carried on by Russis against France, from 1813 to 1814. These works are well known to all commisseurs, and deserve notice on account of the invention shown in the designs, some of which are very happy; the execution is also careful. Hosourable Mention

N. Kunntlorr (318, p. 1376), a painter in the Imperial Porcelain Manufactory of St. Petersburg, exhibits a copy of a landscape with cows, by Berghem, in which the rendered with remarkable truth and admirable execution of the details. Prize Medal.

Lithochromy,

F. Daeger, of Moscow (362, p. 1383), for an illustrated work, in which furniture and other examples of medieval decoration are represented in a very masterly manner. Honourable Mention.

It is to be regretted that so distinguished an artist as Fogetherg, now living at Rome, did not contribute any work to the Exhibition on behalf of the school of his native country, Sweden; and that, in like manner, the Netherlands were not represented by Roger, the Director of the Academy of Art at Amsterdam, an admirable sculptor in the Bealistic style. The works of both these artists would have shown the great excellence of the respective schools of sculpture to which they belong.

THE UNITED STATES OF AMERICA.

The American States, which in the course of a few generations have established so vast a scheme of mnnicipal and political institutions, have attained to great perfection in many branches of industry, and are now beginning to turn their attention to the sciences, and also to those arts which minister to the spiritual rather than the animal wants of man, and which have for their high purpose the investigation of truth, and the expression of beauty through form.

All who have truly at heart the advancement of civilination, and regard it as the common good of mankind, this new movement of the American nond.

Sculpture on a large Scale, Several natives of the United States may be mentioned who have attained proficiency in this difficult branch of art, which cannot be acquired without a certain course

or training. I am acquainted with the works of two American sculptors, Greenough and Hiram Powers, of whom the latter alone contributed to the Exhibition, and whom to make a was only represented there by two specimens or his works:—1. The Greek Slave (923, p. 1467). In this work a youthful creature of very delicate form is represented in marble. The figure is studied from the life, and marble. treatment of the back, especially, is one of the happiest efforts in modern sculpture. It should be noted, however, that the manner in which the right hand of this figure is made to lean on the trunk of a tree, while at the same time the real support of the body is on the left leg, gives an appearance of uncertainty to the motion of the whole figure, and deprives it of that charm of contrast which the sculptors of antiquity imparted to their statues by throwing the weight of the figure decidedly on one side, so as to leave the other side free. It may be added, that the expression of gentle endurance and resignation which characterizes the head, by no means serves to indicate the subject represented by this figure; the sculptor has therefore been obliged to have recourse to the symbol of the fore been occupied to have recourse to the symbol of the marble chain, to justify more fully the title which he has given to this work. 2. A Flaher Boy, listening attentively to the naurmar of a shell (548, p. 1468). A youthful refined figure, sculptured in marble; the execution is careful, but on equal to that of the Greek Slave. Prize Medal.

FINE ART CASTING.

The art of casting sculpture in different metals is obviously of the greatest importance for the diffusion of the finest works. I should not be therefore justified were I to pass over the specimens of Fine Art casting in the Exhibition, though these have been already examined and rewarded by the Jury of Class XXII.

The following artists and directors of foundries may be

particularly noticed:-

(a,) Castings in Bronze.

ENGLAND. The COALBROOKDALE COMPANY, in Shropshire (pp. 659-661). The cast of Bell's figure of the Eagle-slayer shows great perfection, both in the easting and subsequent tooling.

J. A. HATHELD, of London (135, p. 829). "Folcy"s casting of size has been brought to remarkable perfections as remarkable specimen of casting.

ZOLLYMBLY. The foundry of Count G. EXMINDER.

SOLLYMBLY. The foundry of Count G. EXMINDER. of Lauchhammer in Prussian Saxony (1 Zollverein, 762, p. 1032), exhibits a great number of large and important

specimens of casting. Among them may be especially noticed the figure of a Girl at the Fountain, by Wichmann, a very good example of easting and tooling.

FRIEREL (1 Zollverein, 289, p. 1066). This artist has executed, at Berlin, the whole of the casts of Rauch's

coument of Frederick the Great, A Newfoundland Dog, after a model by Moller, and remarkably well cast and tooled, and a number of smaller figures were exand tooled, and a number of annuer against the hibited by this artist.

__C. U. Fischer, of Berlin (1 Zollverein, 296, p. 1066).

This artist also exhibited a great number of casts, among

which may be especially noticed an Eagle, and a Danaid,

Kerlen, of Greiswald (1 Zollverein, 299, p. 1066). The figure of the Muse Polyhymnia, in the Royal Museum at Berlin; a very successful specimen of raw casting. MILLER, director of the celebrated Royal Bronze Foundry at Munich (2 Zollverein, 90, p. 1102), an establishment which has accomplished much under his

estatissiment which has accompisated meet utsleer ins management, and which, under its late director, Stiglmayer, had already produced such an abundance of castings, and on so colossal a scale.

Those executed by Miller are the Lion, which has been already noticed in this Report, and the two soble figures

by Schwanthaler, the first of these being a specimen of raw casting, and the two figures being tooled. These works are most admirable for the sharpoess and clearness of the easting, and also for the beautiful sub-

dued colour of the brouze, FRANCE. Ecx and DUBANT, of Paris (1211, p. 1235) The Dancing Satyr, by Lequesne; an excellent cast, well tooled.

QUESNEL, of Paris. The Venus and Cupid, by Pradier, and the group of a Hunter killing a Stag, by Jean Debay, are also well worthy of notice, Stroom and Sons, of Paris (460, p. 1200). The bust of a Negro, by Cordier; a masterly specimen both of cast-

iog and tooling.

November 1851.

(b.) Castings in Zinc.

By a process recently introduced, copper is deposited

By a process recently introduced, copper a deposited on the zine by galvaniac textion; a become surface is thus produced, which is an beautiful as it is durable. The office of the casting of this establishment—The Amazon, by Kiss; the Hebe, by Canova; the Boy with the Swan, Kalide; Builty Eur; the celebrated fagure in the Apploathch at Manich, known as the "Hineaux," or the "Nobbill," two Sign, by Ranch; also a Colvinthian and

an Ionic Capital. I am of opinion that the Council Medal was quite as fully deserved by this establishment as by that of the

" Vieille Montagne Sr. DEVARANNE and Son (p. 1085). This firm has also brought the art of easting in zine to great perfection, and exhibited a number of works of the same kind as

those contributed by Geiss. Out of this great collection the following may be mentioned as most worthy of notice: the Venus, by Canora; a Lion and a Panther, life-size; and the Danaid, hy

Rauch. BELGIUM. The establishment called " La Vieille Mon-" in Belgium (pp. 161 and 1152), which has pro-Inche. duced a number of zine eastings of remarkable excellence. has exhibited one most masterly specimen, Her Majesty Queen Victoria, seated on her throne.

(e.) Castings in Iron.

ENGLAND, The COALBROOKDALE COMPANY (641, Class XXII., p. 659). A very successful cast of Bell's

Class XXII., p. 659). A very successful cast of Bell's Engle-slayer, The ROTAL IRON FOUNDRY OF BEALIN (I Zell'v, 271, p. 1061). The great importance of this establishment has been already pointed out in the notice of the several specimens exhibited by it. The process of Galvanoplastic deposit may be here also noticed, as another.

Galvanoplastic deposit may be here also noticed, as another mode by which sculpture may be reproduced with necu-racy, and at a reasonable cost. JULIEW MINCKLEMANN (I Zollv., 282, p. 1065), pro-prietor of a Galvanoplastic establishment in Berlin. The status of Fuederick William II., Electro of Brandesburg, ZOLLYKREIM. M. GRESS, of Berlin (1 Zolly., 267, 279, This work is very remarkable on account of the great pp. 1063-65). In the establishment of this artist the sharpness of the forms.

C. WAAGEN, REPORTER.

CLASS XXX.

SUPPLEMENTARY REPORT ON DESIGN.

By RICHARD REDGRAVE, R.A.

The figures after the Names (between purcotheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.

was subsequently determined that it would be more advisable that this duty should be nodertaken by the Jurors of Class XXX., assisted by associated Jurors from the various classes of manufactures designed for. The awards on Design will therefore be found among those of the Jury of Class XXX.

With a view to the permanent record of the opinions formed on the careful examination entailed by their duty, Her Majesty's Commissioners directed a Report to be drawn up by one of the members of the Jury, which should not be limited to the merits of the "Designa" exhibited, but should have regard to the general state of design as applied to the various fabrics and manufactures in the Great Exhibition

Such then are the objects to be embraced in this Report, and they form an extensive and oncross duty to be fulfilled by any one individual. When the varied appli-cations of design and ornamental decoration called for by the different uses, materials, and modes of manufact are considered, and the vast multitude of objects to which they are applied (all more or less requiring examination), the task of the Reporter will be seen to be one of great difficulty and labour, in the execution of which he trusts

The desire evinced by the rudest as well as the most civilised nations for the decoration of their huiklings, nteusils, and clothing, almost raises ornament into natural want, and must render its proper application of the atmost coosequence to the manufacturer, since upon it the value of his manufactures in the various markets of the world greatly depends. It can hardly be possible, therefore, that any one should donht, on the present occasion, the importance of a careful review of the union of design and ornament to manufacturing skill, since all that the inventive powers, the fancy, and the handicraft of man can do, has this year been gathered into one clace, and the world been invited to consider and examine place, and the world been invited to consider and examine it. But without some critical guidance, some indicial canons, or some careful separation of the meretricious from the beautiful, it is to be feured that the public taste will rather be vitiated than improved by an examination of the Exhibition, as it will readily be allowed that the mass of ornament applied to the works therein exhibited is of the former character, and from that very cause mor likely to impose on the uninformed taste of the multitade than the simpler qualities of real excellence to im-press us with a just sense of their worth. Such con-siderations were, doubtless, among the reasons which influenced the determination of the Royal Commissioners on this subject. We have spoken of design and of ornamental decora-

These are two essentially different things, and it is highly necessary that they should, from the first, be con-sidered as separate and distinct. "Design" has reference to the construction of any work both far use and beauty, and therefore includes its ornamentation also. "Orna-"is merely the decoration of a thing constructed. Ornament is thus necessarily limited, for, so defined,

IT was the original intention of Her Majesty's Commissioners that all calabilities "Designs" should be referred a principal place; if it do so, the object is no longer a principal place; if it do so, the object is no longer a principal place; if it do so, the object is no longer a to the consideration of the affect of the representations when the control of the place of the representations of the present time is no reviews. The properties of the representation is not representation of the present time in the views of the representation of the presentation of the views of the representation of the views of views of the views this rule; indeed it is impossible to examine the works of the Great Exhibition, without seeing how often utility and construction are made secondary to decoration. In fact, when commencing a design, designers are too apt to think of ornament before construction, and, as has been said in connexion with the nobler art of architecture, rather to construct ornament than to ornament construc-This, on the slightest examination, will be found to be the leading error in the Exhibition, an error more or less apparent in every department of manufacture connected with ornament, which is apt to sicken us of decoration, and leads as to admire those objects of absolute utility (the machines and utensils of various kinds), where use is so paramount that ornament is repudinted, and, fitness of purpose being the end sought, a noble sim-plicity is the result.

The primary consideration of construction is so necessary to pure design, that it almost follows that, whenever style and ornament are debased, construction will be found to have been first disregarded; and that those styles which are considered the purest, and the best periods of those styles, are just those wherein construc-tive utility has been rightly understood and most tho-roughly attended to. A dissertation apon difference of styles would be ont of place in this Report, as well as an expressed preference for any particular one, since each, doubtless, contains some qualities of beauty or excellence which will justify its use when restrained and regulated by fixed principles. It may not, however, be improper to illustrate by a few remarks the opinion expressed above, since it involves important principles connected with a proper consideration of works coming within the scope of the Report,

To begin with the ecclesiastical architecture of the middle ages: when the style was purest, the construc-tion was most scientific, the arches were best formed for resistance, the groioing elevated and simple, the orna-ment modest and applied to the forms of construction As the style progressed with time, it departed from its primitive simplicity: it became more ornamental, it is true, but at the sacrifice of some of its constructive truth: the use of the arch was partly obscured by its being placed under an horizontal arrangement, and supported by perpendicular mullions, and it was gradually finttened to the worst form for sustaioing pressure. The groioing, at first simple, became a most elaborate system of reticula ion, by its numerous lines reducing the apparent height of the roof, to the entire loss of the sublime parent height of the root, to the entire loss of the sublime effect produced by its elevation and simple groining in the estlier period. At the same time the encomous pen-dants secenced ready to fall on the heads of the beholder, and to bring with them the flattened arch of which they were the key-stones. The exterior was everywhere decorated, effecting the ruin of the huilding by the dust and moss which this humid elimate soon engendered. its last period, decoration could be enried no further, and Gothie nechitecture, which had grown into glory and beauty, from its just and scientific construction, was thrown aside when a florid ornamentation had taken the

place of constructive truth. It was succeeded in this country by the Tudor style, a modification of the Renais-The Renaissance itself arose majoly from the stated. The meanismine tooti arose many from the study of Roman remains, and those often of the worst period of the Empire, when Greek science, skill, and pure taste had fallen before Inotatu magnificence and harbarism, and before modern discoveries had opened up the Athenian treasures of Greek art. It was introduced however, by men of enlarged minds, most of them great constructive architects, and by them it was constructively adapted; they embodied in it many of the just principles of the ancient styles; and if the stream of tradition had brought down much rubbish as well as treasure, still the muster minds of the fifteenth century gradually separated them, and applied with unrivalled skill and a fertile what was beautiful and good. It was, however, essentially pagan in all its details, and its ornament con-veyed no symbolic truths to the hearts of men. In the hands of less skilful masters it soon became decoration without a persading spirit, ornament merely used as ornament, without propriety as without meaning; and thus, as the Tudor style, it succeeded in this country to the Gothic, that style dying out, partly from the causes above stated, and partly from the change of feeling con-sequent on the reformed opinious which then prevailed. This debased form of the Renaissance, in its decoration, had already east aff all constructive truth and cousis tency: much that was bad in the late style was retained and mixed with it; whatever was good was as certainly forgotten. Colomns were reversed, the heavy and broad part being upwards, the small part below; they swelled alternately into enormous bands, and were contracted into severing rings, and sometimes they stood upon balls to give a further sense of insecurity. Terminal figures were introduced which had the weight of their entablatures borne on baskets of imitative fruits or flowers. The covering pediments were broken, contrary to all constructive application, or were placed successively one within another: entablatures were enlarged out of all proportion to the supporting columns; and the useful

was superseded by the ornamental. In France first, and afterwards in all the countries of Europe, the Renaissance was degraded into the style known as that of Louis Quatorze. In all that this style differed from the true Renaissance, it differed merely as arising out of decoration. As a style it never had a co meucement in construction, as the Gothie and Renaissance had, both of which were founded on an architectoral basis; this sprang from the love of the Grand Monarque for magnificence and display. In it, all that was constructively true was disregarded atterly and systematically; thus supports became curved and broken in line exactly where they require strength, bearing-rails were severed in the centre where the greatest bearing is, the union of horizontal and perpendicular forms was sup-pressed, styles and rails as far as possible hidden, veneera applied with the grain neross the framing, and every effort of invention strained, not to decorate the due cor structive truth of things, hat utterly to hide and alsolish construction altogether. The ruling principle of the style, as far as it can be said to have had une, was the avoidance of symmetry, and the search after variety by every possible means: for this reason, central forms had dissymmetrical sides, and the most unequal division of parts was the rule of composition. Nevertheless for the urpose which called it forth, for mere magnificence and display, it was admirably adapted, being one of the most suitable styles for the display of gilding, and for brilliancy and sparkle in metal and ormolu work, showy and glittering beyond anything attainable in the simpler forms of the Renaissance or of classic antiquity. From these qualities it has long maintained its hold on the public taste; and its florid and gorgeous tinsel still prevails in three-fourths of the works of the Great Exhibition, notwithstanding its gross contempt of constructive principles.

The personances of past ages in the tredities of the ornamentist, and trailine over headed down to us things good and bad, both equally conseverated to most minds by the unthority of time. But a monerate's reflection will show just of true tasks for which manufacturers are so conutativity of time. But a monerate's reflection will show just of true tasks for which manufacturers are so co-

how necessary it is to discriminate before receiving anything on such authority. A church or temple huilt in a rude age remains undisturbed by some happy chance, a villa or a theatre in a remote provincial town escapes the fitalities of accident or time, some temh is opened, some overwhelmed city exhumed from the debris of ruin that had gathered over it. The orunmental details found mad gathered over it. The ornamental details found therein are copied and illustrated by the notes of auti-quarians, or published in the proceedings of learned societies, and are at once regarded as authorities for imitation, it being forgotten that they were perhaps the works of obscure provincial artists, of a barbarous age perchance, or of a people with whom art, no lunger studied for its principles, had ceased to progress or had rapidly declined, Such traditional ornament moreover had or had not a local use, a consistent application to domestic, ecclesiastical, or funeral purposes, in fact a local symbolism; but even if it had, this, mostly overlooked, is sure to be soon disregarded; and not only have we ornament of a de-graded period, of a decliniog age, or by inferior artists, but to this must be added, that its symbolic life is totally extinct, and, perhaps, fortunately so, for when revived it is indiscriminately, for purposes totally at variance with its first application and original intent. Moreover, the ornament suited for one material is misapplied to a material different from that for which it was designed. Thus ornament originally carved in stone is used for metal or for wood, or, worse still, for carpets or for dresses. That which was intended to be carved in relief is imitated as the inlay of a floor or the hanging of a wall, and someless anomalies of all kinds speedily arise from undue reverence for and indiscriminate use of traditional orna-That this is no forced view of things a glance at the Exhibition will at once show, wherein are to be seen the sacred vessels of the church imitated for secular purposes; the funeral urns of the Greek revived as drinkingvessels for the table; the colomus of temples turned into candlesticks, and sarcophagi into wine-coolers; while tha decorations of ecilings are applied to carpets, and the carved frieze of an Ionic temple to a muslin curtain: all these errors arising from the indiscriminating use of those materials with which antiquity has supplied as.

Ornamentists may fairly be divided into two classes: the traditional, who superstitionaly reverence the remains of past ages and are wedded in practice to existing styles; and those who despise the past and feel themselves at liberty to adopt from the abundant sources of nature a mode and manner for themselves, without regard to the works of their predecessurs. The first class simply seek to follow where precedent lends them, and to be able to claim the sanction of authority for their works. These, even when taste duly regulates their choice, are men of limited ideas and small progress. Those of the second class, who pay no deference to authority, who think that ornament is governed by no laws, and who see no principles by which they are to be guided, are little likely to raise the art to the level of past times, and, still less, to advance its nim and widen its scope. The true ornamentist would seem to be one who seeks out the principles on which the hy-gone artists worked, and the rules by which they arrived at excellence, and, discarding mero imitation and reproduction of details, endeavours, by the application of new ideas and new matter on principles which he believes to be sound, or which time and the assent of other minds has approved to be fundamental, to attain originality through fitness and truth. The autiquarian organization, those very will always have a certain reputation, and justly, if he has the taste to select what is best from the great masters of post tiones. In any case the critic must be bold who speaks against the authority of the fathera of the art; and praise is safe when great names are on the side of the critic. From this class of ornamentists we may at least demand purity of style, that marked eras should be kept distinct, and that the adopted ornament should be fitly applied to fabrics or manufactures of the like nature, and, as far as possible, for the like uses, as those for which the ornament was first designed. From the labours of the second class of ornamentists, united to that constant search after novelty at any sacristantly urgent, there has arisen a new species of ornament of the most objectionable kind, which it is desirable at once to deprecate on account of its complete departure from just taste and true principles. This may be called the satural or merely imitative style, and it is seen in its

worst development in some of the articles of form.

Thus we have metal imitations of plants and flowers, with an attempt to make them a strict resemblance, forgetting that natural objects are readered into ornament by subordinating the details to the general idea, and that the endeavour ought to be to seize the simplest expression of a thing rather than to imitate it. This is the ease with fine art also: in its highest effort mere limitation is an error and an impertinence, and true ornamental art is even more opposed to the merely imitative treatment now so largely adopted. Let any one examine floral or folisted ornament produced in metal by electrotyping the natural object, whereby every venation and striction of the plant is reproduced, and compare it with a well and simply modelled treatment, where only the general features of the form are given and all the miuntest details purposely omitted; and if this latter has been done with a true sense of the characteristics of the plant, the meanuess and sense of the one mode will be perfectly evident, com-pared with the larger manner of the other. Int this imitative style is carried much further: or-molu steam and leaves bear porcelain flowers painted to imitate nature, and candles are made to rise out of tulips and China asters, while gas jets gush forth from opal Arums. Stems, bearing flowers for various uses, arise from groups of metal leaves standing tiptoe on their points, and every constructive truth, and just adaptation to use, is disre-garded for a senseless imitative naturalism. In the same way, and doubtless supported by great authority, past and present, enormous wreaths of flowers, fish, game, fruits, &c., imitated à serveille, dangle round sideboards, beds, and picture-frames. Glass is tortured out of its true quality to make it into the cup of a lily or an anemone: not that we may be supposed to drink neetar from the flower, but that novelty may catch those for whom good taste is not piquaat enough, and choste forms not sufficiently showy. In fabrics where flatness would seem most essential, this imitative treatment is often carried to the greatest excess; and carpets are ornamented with water-lilies floating on their natural bed, with fruits and flowers poured forth in overwhelming abundance in all the glory of their shades and bues; or we are startled by a lion at our hearth, or a leopard on our rug, his spotted cont imitated even to its relief as well as to its colour, while palm-trees and landscapes are used as the ornaments of muslin curtains. Though far from saying that imitative ornament is not sometimes allowable, still it will at once be felt that the manner wants a determined regulation to exclude it in most of the above-mentioned cases from all works aspiring to be considered in just taste, and to leave it to be adopted by those only who think novelty

better than chaste design, and show preferable to truth.

The constant scarch after novelty has just been alluded to as one of the sources of bad taste in modern ornament. Manufacturers are eager to obtain it at any sacrifice of truth and at any cost. The efforts of those past ages, when taste was most indisputable, appear to have been directed rather to the continually perfecting and refining their designs and inventions, than to creating new ones. Thus in architecture the robust simplicity and grandeur of the Dorio order remained nuchanged from age to age, architect after architect striving only to perfect its just proportions and the symmetry of its parts, rather than to add any novelty of feature or ornament, until, in the Parthenou, it seems to have arrived at the most perfect development that taste, science, and art could unitedly effect Even among the more voluptuous inhabitants of Asia Minor, at least notil the age when their artists became rvants and panderers to the coarser magnificence of servants and pandevers to the conserv magnifecture of aling is utterly extended from our manufactures; it is only in the conservation were few, and those partially on, making more painfully evident bor greatly uniterating, the college of the conservation of the cons

moner enryes rejected for those more varied, beancommoner chief refrection in the import given to their pro-iections. Proportion and symmetry being thus sought after instead of novelty, their ornament has come down to us with authority like that of Scripture, rather than of tradition, and all the after efforts of artists, who have adopted and adapted it, have failed to improve its elegauce, or to add to its beauty. Even in the eastern nations we find the same usage prevail; and to this day Indian ornament is composed of the same forms as it was in the earliest known works: the principles that governed ornamental practice in those works seem still to be a tradition with the artist and the workman, and still to produce the same beautiful results, as is abundantly seen in the fabrics and tissues of the Indian department in the Great Exhibition. Now, however, our efforts are of an entirely different nature, and the hunger after novelty is quite insatiable; heaven and earth are racked for novel quite insatishie; neaven and earin are rawees no sover inventions, and happy is the min who lights upon some-thing, however outef, that shall strike the vulgar mind, and obtain the "run of the senson." Such patterns as often result from the caprice of accident as from any effort of thought-witness what is called the diorama pattern in cotton printing, which was very popular, yet was the result of an accidental folding of the stuff on the eylinder in printing. Accepted for the season, these fautasies no sconer pass away than the world wonders how it could ever have looked upon them with satisfaction, or

strange incongruities, or gross absurdities. The ornament of past ages was chiefly the offspring of handicraft labour, that of the present age is of the engine and the machine. This great difference in the mode of production causes a like difference in the results. times the artist was at once designer, ornamentist, and craftsman, and to him was indifferent the use of the pencil or the brush, of the hammer, the chisel, or the punch: his hand and his mind wrought together, not only in the design, but in every stage of its completion, and thus there entered a portion of that mind into every minute detail, and into every stage of finish, and many a beaudetail, and into every stage of maiss, and many a centiful after-thought was embodied by the hand of the "cunning artificer," many a grace added to the work by his mastery and skill. He worked, not to produce a rigid sameness, but as Nature works:—she produces nothing exactly similar to its fellow, in every turn of every stage of growth, in every flower, and in every leaf, adding a changing grace, a differing beauty; so he varied his labours with every feeling of his overflowing mind. But this is not possible with the stamp, the mould, the press, and the die, the ornamental agents of our days: after the type or model is made, all the products are rigidly the same, whence arises a sickening monotony, a tiresome sameness, unknown in the works of nature and peculiar to these artificial works of man: the varying mind has no share in their production, and man himself becomes only the servant of the machine.

tolerated for an instant such solecisms in taste, such

Moreover, the old ornamentist worked generally from feelings of picty, from love of his labours, or from the desire of fame, motives hardly known to the artist of this desire of fame, motives marmy amountry. Who seeks elass in our days, at least in this country. Who seeks finne from the ephemera of a season? Who loves a labour that is so soon to pass away? Who cares for a work that is not to be the ebild of his own hand, but to be produced in thousands by the aid of machinery? The toil of him of old times was spent upon the thing itself, and not upon a mere model for it: the chalice, the cup, the lock and key, the reliquary, were to be without repetition, and without rivals: he sought to give them their highest excellence, and, labouring from one of the feelings we have described, threw his whole soul into his work, so that it became a thing for future ages to look apon and to prize. Not that handieraft or art-workmanship is utterly excluded from our manufactures; it is only

haudieraft is entirely or partially the means of producing the ornament, as in china and glass, in works in the precious metals, carving, &c. This partly arises from the facilities which machinery gives to the manufacturer, exabling him to produce the florid and overloaded as elecaply as the simple forms, and thus to satisfy the larger market for the multitude, who desire quantity rather than quality, and value a thing the more, the more it is ornamented. This state of modern manufacture, wherehy ornament is multiplied without limit from a given model, by the machine or the mould, ought at least to nwaken in the manufacturer a sense of the importance of the first design. One would think that what was to be pro-loced hy thousands and tens of thousands should at least be a work of beauty, and no pains be spared to insure its ex-cellence. The cost of the first design or model must in such a case be a mere atom when divided among its myrind prototypes. It would seem strange, too, that any one could be found to throw away great expense upon dies and moulds, to carry out a design which in itself was hardly thought worth paying far. Yet often in this was lardly thought worth paying far. Yet often in this country artists are paid little better than workmen, and a belief seems to prevail, that knowledge, skill, and taste come by nature; the artist has often no interest in the result of his labours, his name is nuknown, his pay is niggardly, and what there may be of beauty and excelleuce in his work is often spoiled by the alterations of the manufacturer, who makes no scruple of setting his own taste above that of the artist, and altering and changing a design at his sole pleasure. In France, and some parts of Germany, where taste has long been cul-tivated, and the value of nranmental design is better understood, these relations are better nuderstood also; and in this country, if good taste is to prevail, the manufacturer must learn to appreciate mure highly the value of the designer's labours, must seek to foster his talents and stimulate his amour proper. Society also must be prepared to contribute more largely than heretofore to public education in ornamental art, and taste must be disseminated by every available means; for it is not only truth, but a truth that should be told, that, notwithstandtrain, out a train total snouad oc tola, man, notwithstan-ing our skilled workmansbip and our excellent manufac-ture of most fabrics, we are sadly behind in the design applied to them, and greatly indebted to foreign arists even for what little is good. Moreover our greatest dif-ficulty consists even less in the want of designers than of skilled art-workmen to carry ont designs. A design for cotton printing may be spoiled by the "putter-on," or for silk by him who prepares it for the loom. The sculptur may design a statnette, but there are few able to chase the hrouse, or to retouch the clay, or to unite the parts when they come forth from the mould. Even where such are found, they are mostly men of slow minds, who cuter little into the spirit of the artist's labours, and who work without feeling as without fire. We find plenty of chance while it. We find plenty of chasers able to imitate the fur of animals, or the texture of draperies, but few who understand the boxes and the anatomy of the parts, and fewer still who carry an artist's spirit into their works. In painting, also, the painter on glass and china is generally a mere copyist, or he works too entirely by rote, and without feeling. The lily and the rose which he paints are always the same hily and the same rose, a work of the hand and eye, in which the mind has no share. There are honourable exceptions, no doubt, but with the many art is a mere handicraft. In France, in Germany, in Bavaria, in Italy, this is not the case. There the artist often carries out his own design, and, where he does not, has always at hand a band of skilled art-work-men to embody his ideas, or to complete his labours. The beantiful works in metal by VECHTE, WAGNER, and WEISHAUPT, the china paintings of Jacobnes, Schilt, Declezeau, Hanan, and a multitude of others, and the furniture carvings of Lienand, are choice examples of the above-stated truths; while the works in oxidized silver, such as seal and knife handles, paper-weights, cigar-cases, &c., exhibited by RUDOLPHI, with the bronzes of MENE, PRADIER, and a bost of other such works, show the skill, taste, and knowledge of the art-workmen of France. In France, moreover, there is a fitness and

fancy per ading ornamentation; the ornamout, especially where figures and animals are introduced, being specially adapted to the thing ornamented. In England the ornament designed for one work is made to do duty for twenty others: one figure truly plays many parts, and is often used with an inconceivable want of fitness. But the English public, and the English manufacturers as a body, are hardly yet awake on the question of design: Government has established schools of ornamental art in many of our large manufacturing towns for the purpose of spreading genuine taste, and educating our workmen; but they are as yet a forced product, and have hardly anywhere, after ten years of struggle, won the warm support of the local manufacturer. Even in this Great Exhibition, the question of design was nearly overlooked, and the works of the designer left without a place; has name was nut necessarily coupled with the fabries or manufactures his skill land designed or decorated, and his reward therefore was left to the good feeling of his employer. No special Jury was named to unite with monufacturers in the various classes in judging of the taste and art displayed in the ornamentation of their fubrics; and that art which, as we have before said, is calculated, when excellent, to raise the reputation of a nation's manufactures, was left to the judgment of those too likely to consider, not its real excellence, but what an untaught multitude would purchase and would prize. In France many large establishments bave well-appointed schools attached for teaching drawing and modelling, and the rudiments of science connected with their manufactures. In Germany also, and in Italy, schools and institutions have long been in operation for the cultivation of taste in design; and it will be necessary for this cannutry to enter seriously on the same course, if we are to maintain even nur manufacturing reputation befure the world. In estimating the progress of this country is ornament

and in art-workmanship as compared with the continental nations, there is one circumstance that must enter largely into consideration. In France, Germany, Italy, and Belgium, in addition to schools for teaching ornamental art, royal and national manufactories bave been established for many years. In these no necessary expense is spared to bring to perfection the fabries wrought in them, both as to the highest excellence of workmanship and materials, and to their embellishment by ornamental design. The best painters, sculptors, and designers, as well as men of the most scientific acquirements in botany, mi neralogy, and chemistry, are among their professors; and the works being carried on at the public expense for the attainment of excellence, the cost of repeated failures is unheeded. In such establishments a band of skilled workmen must of necessity be trained to the ultimate benefit of the private manufacturers, and those difficulties which science had found the means of overcoming, or those new processes and new materials which it had brought to light, be spread abroad for the common advantage of all. Moreover, the sight of excellence and of the products of skilled workmanship is one of the greatest stimulants to further exertion, since all art and all manufacture arrive at perfection by gradual advance on past labours. The duced such works in china and porcelain as are exhibited in the Sèvres room or in the hall of the Zollverein, must feel this stimulas in no mean degree. When it is remem-bered what one single artist did in this country for the same manufacture, and how greatly Wedgwood and bis workmen were indebted to Flaxman, we can well feel what influence a band of artists of like ability, exercising their talents to improve every department of the manu-facture, and of these a continued succession, would be likely to exercise over the taste and skill of those in contact with them. Nor is this all: the excellence of one fahrie awakens a desire for like excellence in others, and calls forth the same spirit of emulation. cannot be doubted, therefore, that the continental nations, and more especially France, in this manufacture, and through it in many others, have been largely benefited by such institutions; besides the amount of national reputation obtained by them from the display of the choice

works which are therein produced.

lo these remarks it is not intended to plead for the desirobleness of such establishments in our own country. but only to point them out as the means whereby other nations have attoined to great excellence. It is no answer to such an argument, although it is indeed true, to say that without these aids the general manufacture of such fabrics in Germany and France is behind our own; and that the private show of such works by Minton, Coresuperior to that of any private monufacturer of those e-untries. This may arise from various causes; but with the like advantages on our side it may well be imagined that much greater excellence would have been attaued, the want of skilled art-workmen being felt and acknowledged by these manufacturers as a great hindrance to the complete success of their manufacture. Moreover, it is but fair to remember that such royal and national as that fair to remomer that such roys, and assessed establishmeots, by the beautiful works produced in them, have added largely to the number of rewards won by other nations in this peaceful contention, and have placed at some apparent desidvantage the manufacturers and workmen of our own country. Let us hope, however, working apparent users among the instance was some apparent working of our own country. Let us hope, however, that the time is coming when England will seize engerly every proper means of improvement. Symptoms of it are already ahroad; and there seems a likelihood that the Great Exhibition of the Industry of all Nations will be valuable to oll in showing short-comings as well as excelleuces; and to none will it be more so than to the British nation, if it awakens us to a knowledge of our deficiency in ornamental art, and to a hearty endeavour immediately to remedy it.

It has already been stated that this Report originated in the consideration of "designs." It is proper, therefore, that the works of the designer should be examined and commented on, before the manufactures to the construction or for the ornamentation of which they were intended to be applied. From the artists we have a right to expect that tree taste, that scientific knowledge, and those sound principles, too often wanting in the manufactured works. The difficulties to be overcome in the various processes, or the limited resources of the manufacturer, together with the influence of the public taste on the demands of the market, may form some excuse for the manufacturer if his efforts are imperfect, or directed to sale rather than to excellence. But the designer has so long exclaimed against the bondage which has obliged him to please the public and the manufacturer at the sacrifice of his own better judgment, that he ought gladly to have seized on the present opportunity to exhibit a faith and practice of his own. Now at least he was at liberty to appeal to the few, and, untrammelled by any conditions, to exhibit his own powers, his own knowledge, taste, and better judgment, to lead men to the appreciation of the simple and the chaste as the true source of the beautiful. Another reason for community Another reason for commencing with the examination of the works of the artists was, that if the stream was pure at the fountain, the blame would justly lie with those who afterwards defiled it; or, in plain words, if the designer were proved to have set a good example in his works, false taste, where found, might be placed at the door of the manufacturer; while, on the contrary, some allowance might be made for him if the authorized teacher were wanting in taste and true principles.

Before proceeding with the subject, however, it is necessive for the existence, and application of design, which are to form the subject of this linguist. The largement of the design and manufacture are certified recorded, other very slightly slided to, and all imperfectly considered, the large mades of clauses and sub-dessering with the large number of clauses and sub-dessering with the large number of clauses and sub-dessering with the time and space allotted for such it, larger, to give more than a gament above of the subject. The attempt, the contraction of the subject of the subj

applicable to others, that, even thus generalized, the Report has reference to numerous manufactures which have not been specially considered, and to many individual cases that do nut range exactly under any one of the heads named in it.

use reconstrained in the been to declare the general principles as for an they can be arrived at, which ought to govern the design and ornamentation of any fabric, to to govern the design and ornamentation of any fabric, to the control of the state of

general nears; — Personal of Balanage Dongeste and other Farmiture — Donestie Utensils and objects of Personal Use — Garment Fabrics.

The general heads will be again subdivided as ful-

The general heads will be again subdivided as fullows:—

Decoration of buildings, consisting of—
 1st. Architectural decorations, painted, &c.
 2nd. Stone, carved wood, term cotta, carton-pierre.

and other relief decorations.

3rd. Stained glass.

4th. Inlaid floors, mosaic pavement, inlaid tiles, &c.
5th. Paper and other hangings.
6th. Metal-work,

 Domestic and other furniture, including cabinetwork of all kinds, and furniture of all meterials—

1st. Stoves, grates, fenders, lamps, gas-fittings, and other hardware. 2nd. Carpets, portières, table-covers, and floorcloths.

3rd. Curtains and hangings. 4th. Table-linen.

 Domestie utensils and objects of personal use— 1st. Porcelain, pottery, &c.

2nd. Table and ornamental gloss.
3rd. Works in the precious metals and jewellery, clocks, &c.

4th. Bookbinding.
4. Garment fabrics—

1st. Woven in patterns of any material, and handworked.

2nd. Printed 3rd. Loca

4th. Ribbons.

In recieving these varians classes it may happen this different materials, ornametric by the same means, and applied to the like uses, may be spaken of indifferently to even varied uses may be comprehended nader the same groomst remarks, where the same priorities of ornamentation are affectly applicable, since the object in view maintain the vice distinctions necessary under the several class Reports.

Drv. 1.—Decoration of Buildings. Architectural decoration, painted, &c.

Architectural decoration in casted wood, stone, terra cotta, carton-pierre, gutta percha, &c.

The objects in the Greet Echibides which range under two for the half of this section belong is almost every known with set forms made in the extension of the section of the product of the mass to being them under general refittions, or to define any principles which would be university applied to the contraction of parts of buildings, and of commentation on as to be advantationally applied. Properly speaking on as to be advantationally applied. Properly speaking contracting and interesting the contraction of the contraction

construction, be just, it will be apparent that it is hardly possible to judge of the one without the other. In works wherein the decorator makes his own sham construction in order to ornament it, as well as in those multiplied manufrictured "parts" which form the staple organises of n large class of workness in this line, we may admire the skill of the execution, the eleverness of the details, the excellence of the manufacture, or the imitation of early works of acknowledged merit; but to appreciate " decoration" we must view it as n whole in the place for which it was specially designed, and in harmony with the build-ing whose construction it ornaments. Moreover, it must mainly originate in local circumstances, and ought to have an individual significance. Here, however, the moment we euter upon the varied inspection we become sensible how impracticable it is to lay down any general canon for works which differ almost as widely as the beginning and end of time. In other ages of the world, pations have been forthunte in so adapting design to pre vailing wauts, and in sympathy with existing feelings, as to produce a national style. But in the present day men no longer attend to such considerations; they are wholly without such guiding principles, and consequently are totally without a characteristic style. They are satisfied with the indiscriminate reproduction of the architecture of Egypt, Greece, and Rome, or of Christendom in any, or all, its marked periods. Originality they have none. One man delights in a Gothic villa; another prefers the style of Italy: even India and China have their advocates, who never consider that climate and use should rule the choice, rather than fantasy and whim, and that there was be conditions arising from the present state of society, from fiscal regulations, modern habits, &c., which, duly attended to, would, in addition to mility, be likely to result in novelty and beauty.

It is this servity initially character of architecture which has no largely contributed decentrify alone, to the age of putty, paper manels, and gots percha. These the experiments of the service of the

From this monefactors of ornament arises all that mixture of styles, and that incomprainty of parts, which, perhaps, is itself "the style" of this characteriess age. Through it also, the plasterer and the paper-hanger too offen nursy the place of the arabitect, to the certain dismission of the place of the arabitect, to the certain dismission of the place of the arabitect, to the certain dismission of the place of the arabitect, and the place of the arabitect in tell another than the place of the place of the arabitect in such hinds to the place of the place

are few in number, and are very open to the foregoing criticism.

Those on the foreign side are in the French depart-

ment they even the very unprise of a faintein imagining and of the prise of the state of shiftliffy constructive tradit. Every when reasons it is cross-state or the state of
which is fitted up for its reception is badly lighted, and otherwise unsuitable, and the reverse of what is requisite for a library, for which the decoration is intended: but that matters little, since, under the best circumstances, it could be truly appreciated only in connexion with an architectural reality. It may deserve praise for its extremely dexterous and skilful execution; but this is quite a separate thing from exhibiting any just principles on which it has been designed. It may be said, however, that, as a ceiling, the decoration is too heavy, both in form and colour. This, which would be even more apparent in a lighter apartment, is a great error in a ceiling decoration, having the effect of depressing i', and diminishing the height of the room-a fault often seen in the richly gilt and massive ceilings of the continental It may, indeed, be laid down as a rule, that the decuration of a room should distinish it beavisess, in strength, and in gorgeousness as it passes into the ceiling. Theu again, as to the numerous ceiling decorations beneath the galleries on the English side; from the same causes it is only possible to speak of the skill of the decorative workman, since to judge of their local adaptation is out of the question: the light and graceful decorations being necessarily placed at the same height as the heavier and more richly treated ones, and of course their duo adsptation judged of equally by that height, although, perhaps, the one may have been designed for a much lower ceiling than the other. The like difficulties, arising from causes before enumerated, prevent the proper consideration of the various specimens of wall-decorations. The principles, however, which are given under the head of Paper-hangings, eminently apply to such

The restoration of parts of existing buildings calls for little originality in the designer, since it almost wholly consists in the careful study of the decoration which remains, aided by a knowledge of the traditional ornament of the period. Such are the carefully restored spandrel for Hereford Cathedral by N. J. COTTINGHAM spanares sor riereford Cathedral by N. J. COTTINGHAM (6.5, Main Avene West, p. 852), part of the tomb of Queen Philippa by S. CUNDY (60, Main Avenue West), and the wood-carving for the dining-room at East Stutton Place, designed by C. J. RITGARIJON (Class XXVI., 2074, p. 731). In such works the taste of the designer is shown in excluding the coarser characteristics of the style, and making use of those only which, if less marked are also less extravagant, adopting its general spirit rather than copying its individuality. Thus in the sister art the unskilful portrait-painter scircs on the most salient characteristics of his sitter, and dwells upon all the individual defects of form and feature: the result is a likeness indeed, but a caricature even upon the home original. The painter more skilled in his art avoids such original. The painter more stated in the account of the plainest face is refined and generalised. In the same way a 11/16 becomes degraded. The decorators who adopt it overlook the spirit of its general ides, and exaggerate its peculiar characteristics, until at length it is likely to become a mere distorted caricature. Thus it was that the Renaisneve amoures caracture. Thus it was that the Rensissance degenerated into the Tudor, and the oronment of Louis XIV, was further degraded into the roccoo and hizarre style which now goes by that name. A work, otherwise of much merit, may serve as a slight illustration of these remarks; it is the decoration, carved in tion of these remarks: it is the decoration, carved in walnut wood, for the end of a room, in the style of Francis I., exhibited by Messra, Holland and Foxs (Class XXVI., 161, p. 745). This skilful work is detracted from, in a degree, by want of due selection: thus the large shell-forms, used in the blocking course that the large shell-forms, used in the blocking course that the state of the above the cornice, are beavy and out of place in such a situation, and should not have been so used, however sanctioned by traditional authority. The ornamout of sanctioned by traditional authority. The ornament of the pilasters also, otherwise well designed and skilfully executed, ought in wood-carving to have been kept in lower relief, so as to have been within the surface of the pilaster Itself, instead of projecting beyond, by which it is at once evident that the ornament is applied, and not, as

Space will not permit, even if it were necessary, to speak of the numerous carved and other works in stone,

it should be, carved from the solid wood,

wood, and marthe, for descriptive abilitions to buildings, which did usering sures of the Lichtheim, were those children of the sures of the Lichtheim, where these of design, calls for regical notice. The errors of such as vis will other be found to organize in the construction that which explicit have been tobes in wrought in wood, we would remind the arrandor do in the same or metal. Ourst may be noticed as an example of this minute. Court may be noticed as an example of this minute, from the construction of the construction of the control of the construction of the control of the con-

It may not be amine here to advert to the error arising from excess which these works illustrate. Thus, the form excess which these works illustrate is supsistent to the control of the control of the supported on malachite polestals, groutly detecting from laving only the principal object made of the rare undetable of the control of the control of the control must which would arise from contrast is lost also, and the eye in fatigned with the quantity and sameones of of some homogeneous colour been used for the hoses of some homogeneous colour been used for the hoses

instead of the malachite.

Ornameuts manufactured from plaster materials, such as gutta-percha, putty, carton-pierre, &c., have nu doubt a substantial value in the Great Exhibition, commercially considered. As regards design, however, they are but dangerous subsidiaries, often doing greater injury, from the tasteless, misplaced, and false decoration arising from their use, than good, by ministering to decorative purposes. Apart from that monotonous multiplication of 1986. Apart from one necessarily resulting from the navarying productions of the mould and the die, which has been before allinded to, there are other evils sure to accompany nussifactured decorations such as those now under consideration. The great cheapaess of the substitute, com-pared with the real material, inevitably leads to excess. uch ornament always seems added or applied, stuck on as it were, and can rarely be made to appear as a part of construction; it therefore constantly carries with it a sense of natruth, till the mind and eye, from habit, become satisfied with it, and at the same time deadened to what is really true and good. Moreover, decoration of such materials must necessarily be patchy and incom picte: when the parts to be armamented are large, this evil is seen in its most exaggerated form; a florid and gandy centre has perhaps to be united with coarse corers, either hy other ornaments or hy the repetition of the centre portion, and all sorts of expedients must be resorted to "bring in" the parts so as to suit the architectural distribution of the apartment; it can indeed barely be possible that the quantities, or the geometrical arrangement in which the ornament has been originally constructed, will agree with the place to which it has to be adapted, and more or less of make-shift must be the One of the most important works in such materials is the centre compartment of a room in carton-pierre, by V. Caucher (810, France, p. 1219), which, with all the excellences of the manufacture, exhibits many of its prominent defects, and may serve to illustrate the general faults of such materials. Thus it is decidedly over ornamented, and this is shown not only in the excess of ornament, but in the want of relative scale between the ornament and the constructive forms of the architecture, the former being far too large, as well as too redundant. Scale also seems to have been quite disregarded in the parts themselves, since the fruit and flowers, the birds and game, of one part, are different in size from those of another part. The style, again, is mixed, one part being two centories earlier than the other. There part being two centories enrier man are is, hesides, far more pains taken with the exact rendering of fur or a feather, than in perfecting the form of a moulding, or the shape of a panel-the architecture has, in the designer's mind, been subordinate to the ornament and an ill-formed ellipse, or a course and unrefined moulding, appears of less importance to him than the mere

imitation of the feathers of his birds, or the fur of the animals of which his ornament consists. Carry this treat-ment a little further, and it will result in having the game, the fruit, the foliage, and the flowers out only modelled to the exactest imitation, but the skill of the painter called in to add to its naturalists, and the whole painted with the colours of nature; thus decoration will be thought perfect only when it competes with those strange relieved pietures which are exhibited in frames in close juxtaposition with the work in question. Of the artistic and skilful grouping, and of the merit of the modelling of the ornamental portions of this decoration of Cruchet's, there can be no question; but, as has been before said, even these excellences may merge into faults if they are too exclusively directed to mere imitation, and if the design to which they are applied has not the merit of a just perception of use and purpose, cause of evil in the use of the materials under consideration consists in the false principle of their application to decorative purposes. It is found, for instance, that peculiar qualities, which are difficult of attainment and an effort of great skill in other materials, can easily obtained by a new means; instead, therefore, of carefully studying its just adaptation to ornamental production, the effort is only to emulate in excess those peculiar qualities which are trials in the more intractable material. often happens, moreover, that the original works imitated were in false taste; and this becomes far more apparent in the copies, since the mind can no longer dwell on them with that admiration which is caused by a sense of diffi-culties overcome, and which compensated, in some degree, for the absence of good taste in the works they emulate: for instance, the exact imitation in wood or stone carving of the individual details rather than of the general clinracter of objects used as ornament, extreme relief, underentting, lightness, thinness, and picturesqueness of the forms of foliage and flowers, whereby their natural growth is attempted in carving rather than a due ornamental disposition of their forms-all tending to excess and exaggeration, and to be avoided rather than copied Another source of error consists in readering what should be true constructive forms into mere ornament: thus pilasters, and even columns, consoles and trusses intended to support weight, are manufactured in these imitative materials, and introduced only to decorate, until all sense of utility and construction is lost, and ornament becomes the principal instead of the subordinate. Such materials. however, are capable, under proper control, of useful application to ornamental purposes, both from their ready adaptability to various surfaces and forms, and from the cleanness and sharpness with which they can be monified, as is seen in the works of the GUTTA PERCHA CONPANY (85, Class XXVIII., p. 783), those of Jackson and Son (p. 750), of BIELEFIELD and Co. (157, Class XXVI., p. 744), and of others, as well as in the work above referred to. It is most desirable, therefore, that the errors to which a false application leads should be carefully pointed out, so as to bring these materials as much

as possible within their duly limited use.

Some of the above criticisms will apply to terra cetta
also; has this material, partaking largely of reality and
allowing of being perfected by the hand after the first
mechanical process of mostiding, would, under fitting
regulation, become a most useful and durable agent of
ornamental decoration.

STAINED GLASS DECORATION.

The set of painting on glass, or glass-staining, has come down to us on intumety mixed up with the ecclesization architecture of the middle ages, that it is sincet imposition architecture of the middle ages, that it is sincet imposition of the same pareat (the Church), and from the first both were equally devoted to her service. Of Gettion has always formed a necessary decoration: it follows, therefore, that its ornamentation is almost wholy traditional, and has relating to the survivous periods of the contains.

Not that it is necessary, or even desirable, that the spechs of the two arts should, in their revival, continue

to correspond; but the periods of each, whether simultaneous or otherwise, when utility and beauty were most fully nuderstood and attained, should be diligently studied in search of the principles that guided the actists of those times, and that which is best should be chosen, irrespective of mere correspondence of epoch or autiquarian authority. Moreover, the errors which the ignorance of an early age evidently occasioned should be carefully separated from the truths, and not considered as of necessity a part of the style of the period in which they are found-such, more particularly, as bad drawing and want of knowledge of the human figure; at the same time, that simplicity of treatment which is so highly characteristic of early works, which overhooks all details, and renders a composition from the Scriptures, or a single figure, more as a symbol than as a picture, should, if it is found to be a principle of excellence, be carefully

re-tained. As is the case with all other manufactures and fabrics. so it is with pointed glass: the question of utility, rightly considered, will lead us to some knowledge of what is most suitable in its treatment as a decoration. introduced into the numerous windows of Gothic architecture to temper the glare of light, and to serve in a manner as a blind, by preventing the direct entrance of the sun's rays, and also to shed that solemu religious light which so well accords with the sacred mysteries of religious worship. The mosaic glass of the early artists of the 12th and 13th centuries was most admirably adapted for this purpose: being composed of many small pieces of full and pure tints, with little white glass, the rays of the sun were broken and dispersed, the light lowered in brilliancy, and the whole effect was homo-geneous, rich, and solemn, sufficient light being still permitted to enter for the perfurmance of the religious services of the church. Even compositions of figures were subject to the principle that regulated the whole: the figures were small, so that the colour of their dirperies and accessories might be broken up into many pieces to give the same equal distribution as in the orna mental parts of the window. It would seem, indeed, that the painter did not intend to simulate a picture, but rather to symbolize a sacred text or thought, and the figures, therefore, were not so much pictorially arranged, as composed with extreme monamental simplicity; thus they not only partook of the general effect of the window, but the attention of the spectator, impressed with the solemn yet beautiful light, was, at the same time, filled with the holy thought conveyed by the subject, without being distracted by too great an individuality of parts. The representation of shadow, strictly speaking, was not admissible, the composition consisting only of flat forms of the greatest simplicity. For this, even, there would seem to be inst reasons: the light being transmitted through the glass to the spectator within, shadow would appear to be auomalous and out of place, since the illumination in such a case emanates from the figures themselves; moreover the simplicity of the shadowless forms was better suited to impress the eye from the distance at which such works must necessarily be viewed. Such would seem to be some of the principles which ought to regulate, and which in the best times did regulate, the design for painted glass. An entirely different view of the art has however sprung up with its revival, and has obtained many advocates, especially on the Continent, It has been felt how greatly art has advanced in the hands of the bistorical painter since the time spokes of that the principles of composition, of foreshortening, af perspective, of light and dark, and of the arrangement of colour, then quite unknows, have been discovered and developed; that drawing, then in its infancy and unaided by knowledge, has now arrived at maturity; and that science has given us power over the materials which they possessed not, and enabled us to conquer difficulties which they considered insuperable; and it is asked why the painter on glass should not avail himself of all these advantages, to perfect his art, and reader it as pictorial as the works of his brethren. By artists who entertain these views the surface of the window is treated almost as a canvas would be: the forms of the figures are large.

even us the size of life: the draperies are massive, and the heads painted with great instative skill and completeness. Chair-obseur and perspective are studied, not foreshortening and pictorial attateds in the figures supply the place of the unsumental and statuesque delineations of the earlier artists, in fact everything is done to treat

the window as a picture To the advocates of this style it may be objected, that a picture is specially intended to address itself to the a pacture is specially interested to an interest and send imagination only, while painted glass has a reference to use also; and that, apart from this consideration, each and every art has its own mode of rendering nature - not necessarily implying deep/ive or complete imitation; thus, for instance, the art of the sculptor is a generalized imitation of form, and even the painter of high art does not desire to make his picture deceptively imitative, but listens with impatience to the remarks of the ignment, who are apt to praise his work for this quality above others proper to it which they do not understand. An outline of Flaxman's fills the mind with a perfect sense of beauty and with the fulness of a poetical idea; sarely, then, the flat and simple treatment of subjects in glass-painting, if such treatment is requisite for its utility and most in consenance with its other qualities, may be found sufficient to give as complete an expression to the pictorial rendering of a Scripture trath as the material and situation of such works require.

Among the works in the Great Exhibition, both man ners are adequately represented. Thus the pictorial method is well illustrated in the ably executed window of Marschal and Guyson (\$29, France, p. 1193), of "St. Charles administering the Communion to the Plague-Here the forms are simple and broad, the masses of colour large, and the effect thoroughly that of a transparent picture, with all its details well drawn, carefully painted, and rounded by shadow; while the composition is arranged with regard to the laws of clairobscur. But instead of that general and harmonious effect of sobered light, which is so desirable in stained class for the windows of a religious edifice, the effect is painful to the eye from its extreme brightness, and the window would irresistibly obtrude Itself upon the atteation of the spectator, and rather distract his thoughts then induce that solemn repose of mind which is so con-sistent with the place. The great Dante Window, by G. BERTINI, of Milan (Main Avenue, West, p. 1644), is another example of this method. It is a very skilful work so far as regards the manipulative means, well drawn and painted, and exhausting the resources of the material. As a window, however, it is exceedingly sombre, and would far too much reduce the light in any sominee, and wound far too much reduce the light un any building to which it might be applied. The colouring is cool and pleasant, in which respect it is better than Marechal's window, which is too hot. It is to be observed, also, that the construction of the window is greatly in the way in these pictorial treatments, and that a false construction has been adopted in both these works, in the latter, indeed, without the slightest architectural fitness. The inher method of treatment has also many represen-tatives, some of much merit. Among these, the "History of Sumsou," by A. GERENTE (517a, France, p. 1203), a work of great purity as to traditional style, although in adopting the just principles of design the faults of the age have been adopted also, which must be objected to, The texture of colour in the glass, if such a term may be nsed, has been obtained with great skill by this artist. Lemon's window (565, France, p. 1205), competitive for the St. Chapelle, is also a good example of this manner—dust and time, and the corresion of the glass, have, however, been too much imitated, necessarily perhave, however, been too mach initiated, necessarity perhaps in a restoration, but rather interfering with this nthewise meritorious work. HOLLAND, of Warwick, "Life of Christ" (407, Chas XXVI, p. 700), I. M. Ginus (North-east Gallery, 75, Class XXVI, p. 707), and Messrs, CHANCE and Co. (60, Class XXIV, p. 707), and Messrs, CHANCE and Co. (60, Class XXIV, p. 706), have speciations of

glass of this style of various merit.

It would seem to be a great fault in glass to have a pervailing tint or hue, since by a truly hurmonious composition of colour such a result would be avoided.

his defect is visible in the glass exhibited in the Northeast Gallery, in some of which a prevailing green, in uthers a yellow har, is observable. This is often the ease also with the modern French glass, as seen in some of the restored courenes of Paris, more especially the pictorial glass, in which a hot red has is often present, sometimes to a painful extent : the flesh especially is hot, and dirty in the shadows. It is to be doubted, indeed, if, with all our knowledge of the harmony and complements of colours, we have yet attained to the principles by which the old glass-painters arranged their agreeable combinations. Whatever was the method, the effect was coolness of general tone: the flesh had little local colour, the prevailing tiuts of the draperies and accessories were blue, cool green, and amethyst, and even the red was cool, inclining to crimson. The hot browns of the fiesh in the modern glass, together with its opacity, are often very disagreeable, and the effect of scarlet instead of crimson may be seen in the work of Manzenat, before spoken of, where the robe of the cardinal who is administering the sacrament (a large mass) is of that hue, and greatly tends to increase the hot and plaring effect of the In the Parisian churches, where ancient and modern glass are both to be found, even when the former is not of the best period, as in St. Germain l'Auxerrois, fur instance, it is quite refreshing to turn the eye from the mode n to the old glass, showing how far more harmnnions the nue is than the other.

In artisating the excellences of the one or the other superior starting it the author method is the socioed, and the meads austher liability to accidents from the superior starting it the author method is the superior and the meads austher liability to accidents from the superior starting in the superior starting in the superior district destroy the fixed periors of a pietestial window. I are former to be possible to the superior starting in principle. sure of the winds: thus, at Hoddon Hall, in the long gallery, glazed in the reign of Ellasteht, each window is waved iowards and outwards over the whole surface, and each piece of glass cut to adapt it to this treatment: the result has been great dismbility, even although the lead of uncoloured glass; but it may probably point to some such method being used in decorated windows, to enhance their brilliances and increase their effect.

INLAID FLOORS, MOSAIC PAVENERTS, INLAID TILES, &c. The ornament of this section seems the soundest and most satisfactory in the Exhibition—the most free from false principles, the most thoroughly amenable to true. Although this no doubt partly arises from the combitions of the manufacture, it is, in a degree, to be attributed to other causes. The modern introduction of such works in Eugland was at a fortunate time, when the attention of the ecclesiologists and of able artists was called to the revival of medieval art, and to the study of the best works of Greece and Italy. The designer, therefore, started upon just principles, and continues to adhere to them, even repudiating some of what must be considered errors in the ancient works which have been handed down to us, such as those arrange-ments of light and dark inlays, giving the appearance of relief, which are found occasionally even in the best asscient examples. The "designs" exhibited are almost wholly on the English side. Apart from those in con-junction with manufactured specimens, Mr. Digny WYATT's are the most important: they are varied and fauciful, thoroughly flat in treatment, and consisting mostly of combinations of simple geometrical form although there are some of Italian conventionalised They evidence the careful examination and study which the artist has given to the best antique and mediceval treatments of mosaic. Mr. Minton, of Stokeupon-Trent (86, Class XXVII., p. 770), makes the most important exhibition of such works from designs of Pugin, Gruner, Wyatt, &c., together with some copies of fine medieval examples and ancient works of great merit, The illustration No. 1 is of an enamelled wall-tile. imitated from one found at Salisbury, and is given here to show the mode in which flowers were used as orna-

ment in such works by the incideral artists. The flumer is displayed perfectly flat, in one colour, and arranged geometrically.

PAPER AND OTHER HANGINGS.

If the use of such materials is borne in mind, the oper decoration for them will at once be evident, since this ought to bear the same relation to the objects in the room that a background does to a picture. In art, a background, if well designed, has its own distinctive features, yet these are to be so far suppressed and subdued as not to invite special attention, while as a whole it ought to be entirely subservient to supporting and enhancing the prioripal figures—the subject of the pic-ture. The decoration of a walk, if designed on good rinciples, has a like office: it is a background to the furniture, the objects of art, and the occupants of the apartment. It may enrich the general effect, and add to magnificence, or be made to lighten or deepen the character of the chamber: it may appear to temper the heat of summer, or to give a sense of warmth and comfort to the winter: it may have the effect of increasing the size of a saloon, or of closing-in the walls of a library or study: all which, by a due adaptation of colour, can be easily accomplished. But, like the background to which it has been compared, although its ornament may have a distinctive character for any of these purposes, it must be subdued, and uncontrasted in light and shade; strictly speaking, it should be flat and conventionalized, lines or forms harsh or cutting on the ground as far as possible avoided, except where necessary to give expression to the ornamentation. Imitative treatments are objectionable on principle, both as introding on the senso of flatness, and as being too attractive in their details and colour to be sufficiently retiring and anobtrusive. Some of the best examples, as well of paper as of silk, velvet, and other hangings, are treatments of testure in a self-colour; as of flock on plain or satined ground in paper, of tabby and satin in silk hangings, of stamped forms or cutting in velvet, or the same contrast of pattern with the ground in various mixed stuffs. By these means the ornament is necessarily flat, and does not disturb the general effect. With the slightest attention to the choice of form it can hardly be in lad taste, whilst great elegance and beauty often arise from such treatments. Next to these, graduated tiuts of the same rologr produce a safe and quiet ornamentation for such fabrics; or gold upon a coloured ground, where the gold is sparingly distributed, and the colour not too strongly contrasted, since in all cases a general tone of surface is to be sought for rather than procounted individual forms. Further richness may be obtained by the judicious use of two or more colours, either, according to the auctent method of larmony, separated from each other by bands of black, white, or gold, or contrasted and cubanced by their comwante, or good, or contrasted and commerce by their com-plementaries, and curiebed by flock in either case, in the latter by gold. But it is everywhere apparent that the combination of many colours, though it may increase expense from the number of blocks, is far from producing richness in the same degree, while it has often quite the contrary effect, and results only in poverty and It is necessary, however, to advert to a perfectly different treatment of these materials quite at variance with these rules, and bound by no such prinreples, by which paper-hanging becomes a pseudo-decora-tion, the wall being divided into compartments often irrespective of architectural construction, and pilasters, friezes, and mouldings imitated in false relief on its surface, with compositions of pictures, statues, hangings, flowers, fruits, &c., skilfully designed and well drawn, and, it may be, often most ably blocked for the purpose of printing; it is, however, at best but a sham decoration, often constructively inapplicable, and always impertinent and obtrusive, and should be left to those who, desiring display, are too much wanting in taste to be annoyed at its nutrath and extravagance. It perhaps is not quite out of place in the saloon of a theatre, in cafes, or tuverus, but ought to be conflied to such localities, and only used there until the general taste is so far instructed that the multic will no largest teleprate multithat the public will no longer tolerate goody shams and false magnificence.

The same laws which enght to govern design for

raper-hangings would, therefore, appear proper to rega- | geneous, are less original, and equally wanting in a late hangings of other fabrics, tapestries, &c. Although far from looking at ornament in that exclusive spirit which would reject what is beautiful when it does not square with the requisitions of a theory, it must be obvious that pictorial and picturesque treatments for such falcies are wrong whenever they introde on the domain of another art. Thus figures, landscapes, fruits, and flowers, when rendered as they would be in works of fine art, are almost of necessity inferior to the pictures they imitate, even when they are as skilfully and wonderfally wrought as in the works exhibited by the national establishment of the Gobelius, where every effort of skill and science has been most successfully used for their manufacture and embellishment. Indeed, it is a matter of doubt whether custom, and the authority of great names and of past times, are not the causes of the continued admiration of such decorations, which perhaps we rather persuate ourselves we like than are fully satisfied with, With very few exceptions, the exhibited "designs" for hangings appear to be totally narrogulated by any perception of rules for their ornamentation, and, even when they hannen to be on just principles, would seem to be so by chance rather than by choice. They are mostly florid and gaudy compositions, consisting of architectural ornameut in relief, with imitative flowers and foliage. In some of the eleverest designs the flowers and foliage are perspectively rendered with the full force of their natural slores, and light and shade; moreover, they are often three or four times as large as nature, whereby the size of a room would be apparently diminished. The French are the largest contributors, and their designs are characterised by the foregoing remarks; they are, however, exceedingly skilful in their details, the flowers and foliage well understood and artistically arranged, and blocked with great skill and knowledge; but as to style they are most objectionable, and lead to the worst results, especially in the common manufacture of such goods.

The papils of the Government schools exhibit, among other designs, some meritorious ones for paper-hanging. It is evident that their general taste is controlled and regulated by the knowledge of the just principles which should govern the ornamentation of these as well as of the other manufactures for which they have laboured. Being students' works, they can hardly be expected to abound in fancy or invention, and it is sufficient to find that they are well drawn, skilfully executed, and amenable to just laws of composition. In examining the design applied to the manufactures themselves, the same want just principles is observable as in the works of the gners. It is true that manufacturers must produce works in every style, as well to suit those who are unable to appreciate what is good, as those of more informed taste; hut it might be expected, in an Exhibition of this unture—an Exhibition of skilled labour and of the strife after excellence -that excellence would be the rule, and error the exception, whereas the reverse is generally the Were it a part of the duty of the Reporter to enter iuto the clever and skilful execution, the treatment of the pigments, the excellent blocking, or the general manufacture of such fahries, there would be much to say of the foreign exhibitors, DELICOURT (France, 1715, p. 1258) and Zunez (France, 1536, p. 1250), Spountin and Zun-MERMANN (Austria, 651, p. 1041) of Vienna, and others, as well as of Townsend and PARKER (Class XXVI., as well as of Townson and Labour (1888), and others on the English side; but in the design of their papers there is little to commend, and works of passable excellence in this respect are the rare exceptions to their collections. One or two designs, delicate in colour and on just principles, are exhibited by FETTER and RAHN (262, p. 1375) in the Russisn Court, mixed up, however, with others in the usual false taste; and passable designs on the principles herein advocated are to be found occa-sionally in other collections, evidently resulting from a happy socident rather than a well-regulated choice. The English and foreign mannfacturers seem equally at sea: with the exception of a few simple diapers, which hardly call for individual remark, the works of the best ex-hibitors on the English side, while they are very bettersound knowledge of what is properly characteristic for

such works, There are, however, honourable exceptions to these There are, nowever, nonounsus exceptions to these remarks: after passing in review the paper-hangings of the various countries, it is quite refreshing to meet this clever wax-cloud decorations exhibited by M. E. T. Viver, France, 734, p. 1215. The ornament of these works is without shadow or imitated relief, thoroughly flat in its forms, which consist of graceful and flowing lines; the colour is equal in scale, without harsh contrasts, and of semi-neutral lines. There is no attempt at shams, to imitate marble, or oak, or any carving; nor to panel it, which is left to arise out of the architectural forms; but a series of graceful lines, with a quiet uniformity of tint, satisfy the mind and give repose to the eye. Moreover, having laid down certain principles on which mon-factores and fabrics should be designed with a view to the true use of materials, and to avoid nunecessary display, by the proper application of ornameut, it is im-possible to refrain from speaking in high terms of the works contained in the Mediaval Court, manufactured works contained in the Mediciral Court, manufactured by Mestrs. Mytzke (Class XXVI, 528, p. 761), Mistrox (ibid, 531, p. 761). Chacre (libid, 559, p. 761), and Hardman (ibid, 532, p. 761), ander the direction and from the designs of Mr. W. Pucix (ibid, p. 761). Some may object to the exclusiveness of the style. to its too purely ecclesiastical and traditional character, even in domestic works; but for just principles of decoration, for beautiful details, for correct use of accoration, for beautiful actins, for correct use of materials, and far excellent workmanship, the general collection is unique. Thus, in the paper-hangings, for instance, there is no throwing away of many blocks to ohtain richness, when one or two can be made sufficient: there is a perfect flatness and a subdued harmony of eolour in all such works; and if Tudor roses and heraldio lions are sometimes too pronounced, and there is occa-sionally a little excess of ornament, richness is generally obtained at the smallest sacrifice of means, and without any sacrifice of truth. The same may be said of the hangings in silk and wool, and the carpets in this col-lection, the designs for which are highly commendable for their strict adherence to true principles.

Without having any sympathy with the opplication of decorative paper-hangings, such as those of Dz.z.co.er. (France, 1715, p. 1259) and others, it would be unjust to pass them without praising the artist-like design, the property of the pass of the property of the pass of the property of the pass of the property of t powerful execution, and the great shility displayed in these works by the French artists. In that by Delicourt, besides the skilfully-blocked hunting subject of the centre panel, the details of the parts, such as the grouping of the game and arms on the pilasters, and of the hirds and children on the friese, have great merit, spart from the printing. The same may be said of the work exhibited by Mark Brothers (France, 1369, p. 1241), which is an extremely fanciful and clever piece of decoration, and in as good taste as such false treatments can well be. The frieze of children is well designed and ahly managed for printing; the landscape of Zunnax (France, 1369 p. 1241) has also much merit in its details; and the work of

Greer has parts worthy of examination.

These decorations bear out the remarks at the opening of this Report as to the superiority of the French workg artists. The men who carry out the designer's in-utions in France must themselves have a large share of skill and art-knowledge to be able to prepare the design for the manufacturer's processes with the ability so evident in the works just remarked upon.

Among the English contributions in paper-hanging are specimens of the lately-introduced processes of printing by such machinery as is used for cotton goods, and of applying many colours from one block. These are likely to create a style of ornamentation for such fishries of the most deprayed kind. The largeness and flatness of de-tails attainable by block-printing are less suited to cylinder printing than more minute details, and the new processes offer ready means of applying several colours at a small licace the effort has been to impress as many tints as

the number of colours than any other quality. Thus we are informed that works are printed in "sixteen colours in "forteen colours," &c., the works themselves evi-dencing the absence of all knowledge of the effective arrangement of colour; while violent, crude, and harsh tints are too often used to give greater impression of this excellence! and the result is littleness and extreme meanness; in fact, such papers are, in point of design, much inferior to those printed in two colours by the same nanchinery. Well-considered design, thoroughly adapted for this process, would enable the manufacturer to unite good taste with extreme cheapness; whereas the only present result is by increased labour to detract from the beauty of the ornamentation. It is impossible, however, not to remark the skilful printing exhibited by our English manufacturers.

EXTERIOR AND OTHER METAL WORK. The works, in metal, of this section which are exhi-

hited, consist chiefly of constructions for fountains, and of ornamental iron-work in gates and balconies, and for door-panels, lamp-pillars, flower-vases, and tazzas. best of the metal fountains are so nearly within the limits of fine art, that their consideration may be left to that class. It is, however, to be remarked, that the zine castings of the French and German founders show how suitable that metal is, as a means of spreading the best art, for any exterior purpose, in a chesp and durable ma-terial, as well as of embellishing public works of the above-named character, at comparatively small cost, without the evils arising from oxidation when iron is used. Notwithstanding all that has been said about the incongruity of our climate with public fountains, there are undoubt-edly long periods of the year, and those when London is most crowded as well with her own resident population ns with visitors, when such works are not only extremely ornamental, but when an exhausting atmosphere would render them of real utility and refreshment. The motion of water, at any season, has a great charm, and is peculiar in its power of giving pleasure even in the simplest ict or fall, agreeably and artistically disposed; and ornanicental arrangements for its full display would not only be picturesque additions to our city, which offers so many localities for their adoption, but would afford to our artists motives for combinations of figures with ornamental decoration, and thus, perhaps, be a means of once more uniting fine and ornamental art, which, sadly to the deterioration of public taste, have for so long a time been almost wholly separated. It may be donhted if the public atmost wholly separated. It may be donated if the punite would willingly part with even the tame and common-place repetitions which adorn Trafalgar Square; and those who have had the pleasure of enjoying the fountains of Italy and France will be quite prepared to judge of the effect which more skilfully-designed structures would have on the public mind here.

Such works in iron as gates, balconies, and panels, are, for the greater part, in cast metal, which of late years, from its capability of cheap ornamentation, has almost wholly superseded wrought iron for these purposes. Where the object is intended to be fixed and immoveable, as a baleony or panel, cast work is not unsuitable, and is capable of much beauty of ornamental design, as we see in panels exhibited by Muerit, Wart, and Co. (France, 934, p. 1225). In these the ornament adds to the strength by its numerous articulations, while it is light and elegant in its forms. Works of this kind are generally of a size to admit of casting in one piece, ensuring thereby strength and lightness by continuity of parts. But in cast-iron constructions intended to be movemble, as in the various kinds of gates, a very different character of design is no-essary; in the first place, because entire casting is not always possible, both from the difficulty of running the metal into the numerous ramifications of the ornament in works of such increased size, and from the fear of warping in the cooling, as well as the great expense of a mould, which is saved by forming the ornament of a series of parts. This leads to the necessity of framing the work in wrought, and applying the ornamental details in cast iron; but hence results this evil, that the ornament

possible on paper, and excellence is reckoned rather by has little constructive use, and is apt to look rather an addition than an integral part of the work. In the park-gates exhibited at the south end of the Transept, great pains have been taken to get over this difficulty, but not with success, since the two metals are joined in paris wholly at variance with constructive strength; in fact, it is a wrought-iron design, partly executed in cast metal, Moreover, cast-iron ornament is necessarily far heavier than that of wrought iron, from the extreme brittleness of the cast metal; this heaviness is sadly opposed to its real constructive strength in the manner usually adopted for putting together; the ornamental parts of such structares being riveted or screwed into the framing, there are smaller points of attachment than in wrought iron; the parts bed themselves less perfectly at the junction, since it is impossible to assist this union with the hammer, and the metal has small tenacity, and easily breaks with any sadden jar: thus there is much less power to support, while there is of necessity much greater weight to bear; and without very careful and well-considered design, making the ornament as far as possible a brace to the work, the whole is apt to be an insecure aggregation of parts, without constructive unity or truth. In large works, cast in one piece, such difficulties are greatly sur-mounted, as weight can then be made to add strength, instead of detracting from it. In the old hammerwrought gates, the ornament was not only a truly integral part of the work, but most materially assisted in the general support. Thus great lightness and elegance were in this case, consistent with great strength, since the ornamental details supplied a means, nut only of tying and bracing the work together, but of preventing the front of the gate from drooping with its own weight, to the great hindrance of its use, and which in east works of kind has often to be assisted by the pre of frictionrollers-a make-shift that the older workness would have despised. When, therefore, we consider the varied beauty of which wrought iron is capable, its far greater dura-bility, its tenacity and power of resisting accidents, the individuality of design which arises from its being wrought by the hand instead of east in a mould (thereby lea the fancy and the feeling of the workman untrammelled it seems not too much to say that it is to be hoped the use of the wrought metal will again prevail over that of east for such purposes.

The gates and pilasters exhibited by the COALBROOK-DALE COMPART (p. 659-660), at the north end of the Transept, from designs by Charles Crookes, are an excellent specimen of easting, being wholly of east iron, each gate in one piece. Much of the false construction allusted to has consequently been avoided, and many of the diffi-culties overcome. The design of the gates, however, partakes too much of that adopted in wrought constructions, especially in carrying up the form of the centre, at the top, into florid ornamentation, which tends in this weightier metal to sway down the gate, without any compensating beauty or usefulness. The introduction of a heavy panel of ornament below is also rather commonplace, and due regard seems hardly to have been had to the whole surface in designing the ornamentation, pilasters have more originality: the small twisted bara surrounding the centre columns give n lightness, com-pared with the strength obtained, which adds to the elegance: the striking-plates of the hand-gates, however, should have been ornamentally constructed or banded in with the pilasters in the centre, to increase the strength and resist the jar of the closing. The other great work in metal by this Company is an ornamental dome of cast iron (Main Avenne West, 83). This is a work of much pretension, designed in the natoral style, the pilasters representing oak-stems, ornamented with leaves and acorns, and with the intercening branches twisted into an oriamental form: this treatment is mixed with some conventional ornament, here and there, as it were, indis-eriminately introduced into the pilasters, having a very patchy effect. The pilasters, also, arising as they do from a single stem, and widening above their base, lave an unsteady and insecure appearance, which might easily have been avoided. The great fault, however, is in the setting on of the dome, which from the outside seems to

have no constructive connexion with the pilasters, since in It the rusticated treatment is abandoved, and it seems dropped in among the branches, without any proper sup-port. The work, severtheless, has a certain impressiveess from its size, and its general proportions are well chosen.

There are in various parts of the Exhibition gardenseats and chairs in east metal, which are principally to be noticed from the great want of due consideration of the material evidenced in their design; thus sometimes they are ornamentally constructed of branches and foliage naturally imitated, or of branches alone; while, in others, carved and flowing lines are given to the back, arms, and legs of the seat, which add nothing to the comfort of their use, and sadly detract from the form properly belonging to such works in cast metal, which should be right-lined, and have a geometric character both of ornamentation and construction. It must be confessed, indeed, that the tendency to consider the ornament before either the requirement of the material or the use to which the work is to be applied, is but too evident in many of the works in metal in this class. Thus, two large lamppillars, designed by an architect, and exhibited in the Austrian department, have as much iron in their overcharged bases as would found three pillars, each capable of sustaining the taper upper shaft of the same design The application of metal to the construction of the building is, on the other hand, an excellent example of just use, construction having had the first consideration, and ornament being entirely subservient; a due amount of elegance has nevertheless resulted from its simplicity, and from the true principles on which it has been designed.

Day. 2 .- Domestic and other Furniture. A very large and important section of the Exhibition

is comprised under the head of furniture and upbolstery, and such works claim especial attention in this Report both as to their general design and their ornamentation, Almost every nation contributing to the Exhibition has sent to us its share of furniture, so that here, it might fairly be supposed, we should be able to study the conveniences for living which each country possesses, and their various contrivances for case and rest

The English natioo, more especially, having that pe-culiar word comfort in its language, might be expected to exhibit how that sense of comfort is adequately provided for; and since, as a untion, we have a reputation for what is solid and substantial, that our furniture at least, so mixed up as it necessarily is with our daily life, with our home habits, and with our national mode of living, would, both as to design and ornament, be solid, substantial, sensible, and useful. Our continental neighbours, on the contrary, living as they do more abroad than the Eng-lish, and being usually presumed to delight in the gay and the ornamental, would be likely to display more fanciful, showy, and decorative works in this Class. In other manufactures, plain and useful fabries are exhibited, even when they have no preteosions to examental design; it seems therefore rather unfortunate that in the furniture on both sides of the huilding, but more especially on the British, the ornamental so Inrgely prevails to the exclu-sion of the useful, and that tables, chairs, and beds, fitted

for convenience, rest, and repose, have been made to give place to what are presumed to deserve the name of objects English furniture has, until lately, coluyed a reputa-tion for its excellence of make and thorough usefulness, and manufacturers were wont to rest their credit ou good materials and excellent workmanship. In such furniture the doors fitted with the nicest accuracy, the drawers moved with perfect smoothness, and the wood was so well seasoned that a faulty panel or shrunken joint was out of the question: it descended as a possession from father to son, seeming the better for its very age, and, as is faucied of old pictures, gaining richness even from time. But these seosible qualities, in which we undoubtedly used to excel, have on this occasion been less regarded by our manufacturers than decoration and display, and they have mostly selected furniture of a class allowing

the largest application of ornament, as sidebeards, cabinets, bookcases, and works of the like kind, an which to exercise their skill, too often neglecting their own peculiar strength to rush into competition with their foreign rivals, without the skilled art-workman to execute, or the taste to design, which they possess. Nor is the foreign depart-ment wholly free from this misdirected effort to excel. which has resulted in many instances in over ornamentation; thus, there are chairs so decorated that rest is impossible, cahinets and bookcases which take up much room and hold little, and beds so monumental that they remind us rather of the last sleep than of a couch fitted for our nightly repose.

nor our nagenty repose. In endeayouring to lay down principles which may serve as general rules for the designer, it will without difficulty be conseded that, in every kind of familiare having a specific purpose, the first consideration of the designer should be seen. naving a specific purpose, the first consideration of the designer should be perfect adaptation to intended use; this may appear so obvious a truism as to want no enforcement, but a walk through the Exhibition will speedily undeceive us, for there we see a multitude of objects offending against this rule; in some of these use is almost offending against this rule; in some of traces use is among cutively overlooked, or has been evidently quite a secon-dary consideration, whilst in others it partially gives way either to effect or ornament. Thus in the English department a table of costly mannfacture has ornament in solid rulef on its upper surface, and many of the grates evidently require a glass-case, since fire and smoke would be the worst enemies to such polished marvels. Nor are these faults peculiar to Eugland; on the foreign side may be seen a pianoforte, surrounded by hristling bullrashes, which must always be catebing in the dresses of those who approach it, and with hardly a right line in any part of it; and chairs so beavy that they must be fixtures instead of moveables; while of minor incongruities, the instances are too numerous to specify. Manufacturers should also aim at obtaining the greatest amount of convenience and accommodation in the least space, in order that the furniture may be as suitable as possible to the size and uses of the apartment in which it is placed. Another consideration to be attended to is stability of

construction, apparent as well as real; the first being recessary to satisfy the eye, the last being indispensable to excellence and durability. Thus the legs of articles of furniture, designed in the style of Lonis XV., are often broken in the centre across the grain of the wood, or having their hase of support far within the perpendicular line of the bearing; a fault which, though not actually rendering them unstable, yet offends the eye as much as

if they were really insecure. The constructive forms, moreover, should not be obscured by the ornament, but rather brought out by it: nor should all portions be equally decorated, but only such parts as friezes, pilasters, enpitals, pillars, or paoels; herein simplicity is the safest guide to beauty. Over-enrichment, indeed, destroys itself, and it would not be difficult to point out works of the greatest pretension and the most costly workmanship, which are completely spoilt by this fault. Cabinets entirely covered with earying, the very stiles and rails being as decorated as the panels and pilosters; metal chandeliers, with leaves and flowers in as great profusion as in nature: papier mache hidden under a surface of pearl and gold. So extremely prevalent, indeed, is this error, that it may be said to be the raling vice of the Exhibition. It should be remembered that contrast is one of the first elements of pleasure, and that repose is one of the most valued excellences of art; thus simplicity serves as the background to orunment, as the setting to the gem, or the foil that cohances the beauty of the jewel; and the good artist is as much shown by sparing his labour as the bad one by over-

It results from the above rule that ornament should It results from the above rule that ornament about arise out of construction; the work, abstractly, should be constructed, and then decorated; not that it is mean that the cramment should be applied to the object, but (as in wood for instance) carved from it; than the leg formed for support, the pilaster or columns for bearing, may be lightened and euriched by cutting away from the block or slab, not by adding to it. It has natural state man is

eoriehment.

a true workman in this respect, and works on just prin-ciples without knowing it. The New Zenlander or the South Sea Islander first forms his war-club or his paddle of the shape best adapted for use, and then curves the surface to ornament it. The Swiss pensant, or the shepherd of nur own hills, does the same. Such also is the case in the Eastern specimens of these works in the Exhibition, as is particularly exemplified in some choicely carved sandal-wood boxes in the Indian Department. Here the natural and the refined taste agree, for the best woodcarved ornament of the Renaissance is on this principle, low in relief, seldom projecting beyond the surface of the pilaster, or the framing of the panel. In this respect the French furniture as a whole is advantageously contrasted with ours, there being less of that imitative treatment, of those hulky hunches of flowers and fruits, which roject in such graceless abundance from a large number of the British productions. This arises partly from their far greater knowledge, partly from their better appreciation This arises partly from their far of the laws of ornamental treatment and arrang

Another subject requiring attention from the designed in the judicious behieve of the materials from which the works are to be manufactured. Allusion has before been made to the error of subpting one material to the ornamade to the error of subpting one material to the ornamade to the error of subpting one materials to the ornamade to the error of subject to the error of the error avoiding this fault, the material itself should be so error ployed as to display it to the greatest advantage, and to produce the fullest effect of which it is capable. This galax, or any other material,

Thus, for instance, in wood-carving care should be taken not only to have the relief so managed as to guard the work as much as possible from accidental injury, but the designer should seek to adapt the forms of the ornament to the direction of the grain when it is open or free, and the work should be framed with a view to this consideration; moreover, ornamental carving should not be applied to wood of strongly-marked party-coloured grain, hut that which is homogeneous in colour should be selected for the purpose, in order that the shape of the ornament may as little as possible be interfered with hy being mixed up with the forms and colours of the grain, It is curious how much costly and skilful labour has been thrown away from inattention to such minor considerations as these. Again, in metal work a careful study of the material will suggest, among other things, the proper treatment of the surface; this is a matter of the greatest importance to the general effect. A due distribution of huraish and mut, of gilding and plain, or of the various kinds of surface tooling or frosted work, is of the numous kinus of surface tooling or fressed work, is of the nimost consequence—not to save labour, though this may result from it—but to give richness without gaudiness, and to enhance the beauty of certain parts by contrast with others. When the whole surface is hurrished indiscriminately, as is frequently seen, the result is a elitter which obliterates form: when the whole surface is mat, the peculiar quality of metal seems lost from the want of

In some of the furniture exhibited, otherwise of much moreful, the enuments in merely conventional, and derived from known examples; while in others, it has been so that the conventional of the conventional conventional more and the conventional conventional conventional conventional works of this class, as almost to destroy the pleasure merit, but conceits and posefulician for referring to some works of this class, as almost to destroy the pleasure, shall, however, have the gradification of referring to some well-considered works of this kind which are evidently the results of an imaginative and thoughtful minds, the results of an imaginative and thoughtful minds.

Great Exhibition, besides those which are shown hy persone exhibiting also manufactured works of a similar kind. In such cases it has been thought most desirable to judge of the manufactured product rather than of the states of the case of the decay of the case of the two largest exhibitors, may thus be judged of, such they both exhibit completed works.

These general remarks will serve to introduce the first

subdivision of the section-

CABINET-WORK AND FURNITURE OF ALL KINDS.

The furniture of a man's house had need to be well designed, well constructed, and indiciously ornamented, for, from being constantly under his hand and cyc, defects overlooked at first, or disregarded for some showy excellence, grow into great grievances, when, having become an offence, the annoyance daily increases. Here at least utility should be the first object, and, as simplicity rarely offends, that ornament which is the most simple in style will be likely to give the most lasting satisfaction, Yet, on looking over the various articles of cabinet furniture exhibited, how seldom has this consideration been attended to. The orgament of such works on the English side consists largely of initative earving; buuches of fruit, flowers, game, and utensils of various kinds in swars and festoons of the most a assive size and the boldest impost, attached indiscriminately and without meaning to bedsteads, sideboards, lookeases, pier-glasses, &c., rarely carved from the members of the work itself, but merely applied as so much putty-work or papiermache might be. The laws of ornament are as pletely set at definee on those of use and convenience. Many of these works, instead of being useful, would require a rail to keep off the household. A sideboard, for instance, with garlands of imitative flowers projecting so far from the slah as to require a "long arm" to reach across it, and ever liable to be chipped and broken; and cabinets and bookeases so bristling with walnut-wood flowers and oak-wood leaves, as to put use out of the question. Now, besides that such treatments are not ornamental, they are not beautiful, and only enter into competition with stamped leather and gutta percha. There is great reason to doubt if this merely imitative carving is ever just in principle, when applied ornamentally to furniture; for, although the masterly chisel of Grinling Gibbons has raised it to great favour in this country, and although it may be tolerated when executed as skilfully as is that on a pier-glass frame by W. G. ROGERS (Class XXVI., 193.), p. 750), yet it becomes absolutely unhearable under less skilful hands, and when it is lavished in such profusion as we find it on many other works. On the foreign side, as has been remarked, there is far less of this false mode of decoration, and a better some of ornament prevnils; the works are more frequently designed in the traditional styles. In France, a medification of the Renaissance is principally used, and in this the oranment is in low relief, and does not interfere with use; although false construction is a vice of that period, which has not been remedied in modern works, but is sometimes exaggerated. The style of Louis XV, lingers in some of the French

works; its playfuluess of line and surface, its varied treatment and mixture of materials, together with its showiness, still command favour with the multitude. the French Court (and in some works on the English side, probably of French manufacture) it is seen in its genuine character. The surfaces of these works are curved, when practicable; they are veneered in parti-coloured woods, and panels are formed by or-molu mouldings, often in both instances completely at variance with the true construction; and occasionally the panels are filled with poreclain examels, the whole having at least a gay and sparkling appearance. Some attempts have been made in the English Department to adapt ornament of this period to cabinet furniture, but it has been totally misunderstood. Instead of the treatmentabove described the hold scrolls and shell forms used in the decoration of rooms at that period are here seen carved in all their coarseness on furniture. Such works bear out the remark before made, that these forms were especially adapted for gilding, and, indeed, are hardly bearable, except when to treated, or when made of metal. This becomes even more apparent when full-coloured woods are used, such as mahogany; in this material the ornament is even more coarse and heavy than in lighter-coloured wood. Since however, the vendors of cheap furniture have adopted this manner as a cheap and flashy decoration for their goods, it is to be Loped than it will soon be entirely proscribed, or retained only by such dealers.

Those designers who unreservedly adopt the ornament of past times must, of course, apply it to their works without any peculiar significance or connected idea, but without any peculiar significance or connected idea, but merely for its beautiful forms, elegance, grace, or rich-ness. Where, however, any significant allusion, senti-ment, or happy idea can be embodied in the ornament, uniting it with the use and intent of the work on which it is to be placed, it will have a charm which the others want. Not that this want is peculiar to the application of traditional ornament, since the designer in the natural or imitative manner seldom attempts any connexion be-tween his decoration and the work to which it is to be applied. There seems no fitness, for instance, in surrounding the frame of a pier-glass with dead birds, game, having a just and characteristic significance. This piece shell-fals, nets, &c., although they may be excellent of furniture is of rare scellence and entri in design, and specimens of carring, not it clear why eagles should of skilful and artistic execution as to carring, and,

support a sideboard, or dogs form the arms of an elbowchair; nor, again, why swans should make their nests under a table, at the risk of having their necks broken by every one seated at it: indeed, in most cases, as such initative forms cannot in the strict sense be called orna-ment, they almost challenge inquiry as to wby they have been adopted, and disappoint us when we find it has been without motive: this is not the case with traditional ornament, which, like the current coin, is accepted at once

without inquiry.

The sideboard, carved in walnut, as here shown, and which is exhibited in the French Court, by Foundations (France, 1231, p. 1236), is an apt illustration of organient

although of a highly decorative character, in fitted for I which are treated as statuss, the cornice is bracketed, the purpose for which it is intended. Six stops, emble— and supports beys with the implements of the vineyand material of the chace, resting on a floor of inhist wood, and of agriculture. It rises into a pediment in the support the slath, which has a simple carved moduling | centre; this is broken in the manner of the Renaissance, along its front, and is inlaid in geometric forms. The dogs are not merely imitative, but are treated as a part dogs are not merely mustive, not are treases as a par-of an ornamented bracket or console, thus composed architecturally for bearing and support. Above the slab, standing on four pedestals, are female figures, gracefully designed as emblems of the four quarters of the world, each bearing the most useful production of their climate as contributions to the feast. Thus Europe has wine; Asia, ten; Africa, coffee; and America, the sugar-cane. In the central space between the pedestals, which is rather tha widest of the three, the products of the chace are poured ont on the very board, and above this the space is poured ont on the very board, and above this the space is filled with a framed picture of rare fruits, giving an op-portunity to enliven the work by the addition of colour. portunity to emirren the work by the addition of colour, it is consistent as a slower, and they have a sideboard, without militating against good taste; above the figures, while it is thoroughly fitted for its purpose as a sideboard,

and decorated with a figure of Pleuty crowning the group. The apright line of the back is gracefully varied at the sides, and constructively strengthened by carved brackets, above which are terminal figures bearing the implements of fishery on the one side and of the chace on the other. The panels of the pedestals and of the side compartments below are filled with enryings formed of the fruits of below are filled with earrings formed of the fruits of varions countries, grouped with the instruments of horti-culture and agriculture. Two brackets on the side com-pariments between the figures give an opportunity for placing silver plate in a position for display. The orna-mental parts of this piece of formiture are carred through-out in a masterly manner, and in a bold and free style; it is committed as a whole and free from presilities and it is consistent as a whole, and free from pucrilities, and

It is at the same time of a highly orannestal character, without any off independent on throw away. It corresponds its its constructive time with the way of the constructive time with the care in the property of the constructive time with the care in the property of the constructive time of the property of the constructive time of the property of the care of the property of the care of the constructive time of the con

throughout is an additional merit, and the wood has been judiciously chosen as to colour and grain. When we turn from such works as the above to furniture designed strictly in accordance with the rules of a traditional style, we feel that there is often a cold propriety about it which requires consideration before we can admire it; yet among such are some of the best works of the Exhibition. The wardrobe of T. F. Werre, of Stuttgard (Wurtemburg, 70, p. 1118); the console-table and glass of A. Barnertt, of Siena (Tuscouy, 91, p. 1298), are excellent specimens in their kind, well designed con-structively, and ornamented in exact conformity with the Renaissance style; the cabinet of RINGUET-LEPRINCE Remaissance style; the calmet of KINOUNT-RAPHINGS. (France, 1437, p. 1245) has ligh merit; the ornamental treatment of a pictore-frame by M. J. LINEMARO (p. 1239); the cradle in the Fine Art Court (352, p. 842), so skilfully carred in boxwood, by W. G. ROUIS, from o well-supposed design by his son, W. HLARW ROGIES, alloy, and the state of th works are in the French Furniture Court, although in them the style is often mixed, and the constructive faults of the Renaissance have been adopted as well as the ornamentation. In other styles, perhaps, the best example of a careful adherence to tradition is observable in the furuiture of the Mediæval Court, as in a Gothic sideboard, really fitted to display a service of plate; a carred oak enhinet bookcase, hy J. G. Crace (Class XXVI., 530, p. 761); and other works. These are particularly to be commended for their sound constructive treatment, and for the very judicious manner in which ornament is made subservient to it. The metal work is also excellent, and the hrass fitting of the panels of the bookcase deserves to be studied, both for the manner in which it has been put together, and for its graceful lines. The candelshra of the sideboard also are sensible forms, without any unnecessary ornament. Such furnitore in old times was often ornomented with mottoes or texts, a practice which might ornomented with mottoes or texts, a practice which might well be revived, as having far more significance than the commonplace conceits of much of the ornament of the present day. It may perhaps the objected that the general forms of furniture in this style want variety, and this is rendered more apparent by the fordid lines of many of the works around them; but the principal reason will be found to arise from a due consideration of the true conforms on account of its grain, and requires horizontal and perpendicular lines as the basis of framing. The ecclesiastical character of the works in this Court has been already alluded to. It must be remembered that the spirit of the age from which they have been adopted was to hring a sense of the pervading authority of the Church, and the outseard forms of religion, at least, into all the offices of daily life. This was altogether changed when the revival of ancient learning and of ancient art destroyed the Christian symbolism of ornament and deluged the Roman Church with decoration derived from Paganism, not commandantly stiff of commandantly eight of the many and consequently entirely opposed to the true spirit in which all ecclesiantical orannent should be conceived. The change in ecclesiantical decoration soon pervaded domestic farniture also, and ornament lost all significance and symbolic life. Some credit, therefore, is due to the revival of a better and purer state of things, and a return to the old paths and avoidance of the present mere sensualism of ornament. Yet it is not on this account, but

as examples of careful and strict adhesion to true principles of construction and ornamentation, that the works in this Court are so often alluded to; they deserve commodation for their illustration of truth, and as showing what one man, by earnest and well-directed attention, can earlieve in the reformation of taste, and in the training and the contract of the court
least among their may recellence.

The case of mousel instruments have been buyly. The case of mousel instruments have been buyly must be classed under the hard of furniture. See what, exhibited under the hard of furniture. See the contract of the contra

concert of muleid instruments around the one ornatice. There seem to be at title investion as fitness in subpiding types as legs to planelette, yet this has been pupiling the superior, especially in the case of grand planelettes, appears to have been overlocked. Inlays of metal, mother-of-pearl, or tortoiseshell, may be introduced with excellent effect in furniture; but they must be used sparingly. Such a marvel of labour as ti table exhibited by PEREZ (271A, p. 1346), in the Spanish Court, of course does not come within the scope of this remark; the subdued colour of the wood used, and the forms chosen, are nevertheless so judicious, that as a piece of ornamental inlay it is excellent for its art, as well as from its curiosity as a feat of labour. Some of the buld enhinet furniture in the French Court may be instanced as showing that an excess of really beautiful ornament tires us, and causes meretriciousness. ner some excellent specimens of geometrical wood inlays for furniture exhibited by Marckin (France, 606, p. 1207), and the inlaid top of 0 toble among the furniture by Leistlan (pp. 1039, 1040), in the Austrian rooms, has much merit; such inlays come under the same general laws as mosaics, which have already been treated of, requiring great simplicity and perfect flatness. The table (112) in pietra dara, by Boschetti (Rome, 17, p. 1286), consisting of a wreath of orange-flowers, bordered by a simple line, is in the parest taste; the more costly one near it is marred by the introduction of a band of architectural ornament, contrasting far too strongly with its ground,-a fault worthy of notice, as it prevails

connected with cheap manufacture.

Some of the greatest flushs in the furniture of the Exhibition are its unsuitableness to uses, and its false construction Look, for instance, at the costly articles of the Austrian rooms, and it will be found as skilful in execution as it is deficient in adaptation to its intended surposes. The bed looks more fitted for a corpse to lie purposes. The bed looks more fitted for a corpre to ue in state on than for a place of repose; it is a congeries of parts without an object: the footboard is so high and solid that it shuts in the sleeper as in a prison, and com-pletely impedes the free circulation of air; the footposts rise from massive purposeless bases, and dwindle into mere sticks as they approach the heavy canopy; the wood selected is unmitable for carving, its party-coloured grain blurring the ornamental forms. In the other furniture like inconsistencies appear; in the cabinet large spaces are thrown away, and therefore, though occupying much room, it has little that is available for use; the centre space, with its canopy (though pretty), has no apparent purpose, and it is quite disproportioned to the size of the wings, besides being deficient in the appear-ance of support. The bookease has the same fault of room thrown away and of unsuitableness to use, besides being a false adaptation of Gothic stone forms to wood-This latter fault is elsewhere also largely prevalent; it is an error in most of the Belgian furniture. Thus we have a wardrobe which would be more characteristic as an oratory, and a bookcase with arches that support nothing, and huttresses which have no thrusts to resist. Indeed it should be remembered that the arch is not a wooden, but essentially a stone construction; it will be evident, on a moment's consideration, that it is a means of obtaining support by a number of separate small parts, the reverse of timber construction. It ought, therefore, to be well considered before being used in wood, wherein it should arise rather from coupled knees or brackets introduced to strengthen horizontal beams, than as an independent form. Its improper use will also be seen in various sideboards on the English side. In these the back consists of a mirror, over which a wooden arch is thrown; the glass having the effect of a void or opening; the thin wooden areh, bearing nothing, not only has a meagre appearance, but, having nothing its thrusts, is quite as much at variance with the use of the material as it is with a proper sense of construction. tine of the best of such treatments is seen in an elegant cabinet and mirror exhibited by Mr. SELL (Class XXVI., 170), wherein a light inner column and arch, metallized by gilding, is introduced with good effect; even here, however, the pliasters which support the outer arch seem to want brackets at the sides of their base to give more appearance of support, for the introduction of which there is ample space; the small abortive ones which are used serving only the more directly to pointing out this want.

Slam construction is another error alluded to, not only of the kind before spokes of—the neprosision of the true constructive forms, as purely, framing, &c., and giving unaba prominence to others,—that also where those porcolarms in cabiners, legg in sidelecards, &c.) are made to more from under the parts intended to be appareted when opening the doors of the furniture. This is a common case in cabiners designed in the Bensiannes relyt, and case in cabiners and capital the design of the the second construction of the second constructive for the protection of the second constructive for the second contractive for for the seco

glaring kind, as where legs are made to remove, or where the whole front of a cabinet or wardrobe is unade into doors hanging to the sides without a framed face and hanging style, and both the side and centre columns (where columns are so used as decorations) are made to move with the doors.

In reviewing the furniture of the Exhibition, the onestion of the education of the art-workman again comes promioently under review. While it must be confessed that the general design of the French works in this class are greatly in advance of our own, it is also apparent how much more widely diffused in France is that artknowledge, which, combined with handicraft, constitutes the true art-workman. Although this is peculiarly seen in works in metal, it is evident in many other branches of industry. Wherever the human figure is used as ornament in English works, it is pretty sure to be faulty: be well composed, may be evidently the figure may designed in good taste, since that is often the work of a superior artist; hat in the excention it is almost always disfigured and spoiled. The extremities are finished without knowledge of the internal structure, the fingers, toes, and joints have no bones within the skin, but that "gummy" undecided treatment which evidences the igno-rance of the workman. In wood-carving this is equally Very often in such work the "design" of the ornamental forms, Very often in such work the "design" of the ornament would seem to be by the same unskilled hand that carved it, since it is mostly out of place, coarse and merely "natural" in style, and rarely reaches beyond the expression of the most commonplace thought, or the imitation of the commonest fruits and flowers. That great power of imitation and skill of hand, however, are not wanting in the English carver, is evident from many examples, in the English carver, is evident from many examples, and is particularly shown in the beautiful and delicate flowers, &c., of T. W. Wallis, of Louth (Fine Art Court, Class XXX, 89, p. 825, which are quite equal to the Freech works in the same style; but even these go no further than juniption and the homes female. no further than imitation, and the human figure cannot be carved by a merely imitative process:—success in readering either the human figure or animals when in life and motion can only be the result of knowledge attained by a careful study of the structure of the bony framework and of the moving muscles; and it is the want of such anatomical knowledge and of a proper training in art that causes the deficiency we are obliged to notice in the English Department, and compels the carver to confine himself to mere works of imitation, knowing that higher are beyond his powers.

The two figures in the front of the cabinet of RINGUET

LEPRINCE (p. 1245), for instance, are unapproached by anything in English furniture; as is the rare excellence anything in Engine normal as in the of the carrings on the sideboard of Fornnixots (p. 1236), and the works of Lienard (p. 1239). Even where the figure has had a partial study, the initiation is often cold and "mannered;" the letter is followed rather than the spirit, and it is almost impossible to find a workman entering into the feeling and spirit of the artist-designer, and treating the work in a good and bold style. The bronzes of men and animals are perfect instances, in French works, of the power of the workmen to enter fully into the feelings of the artist, and to appreciate style and intention, but the same anion has hardly anywhere been attained by the English workman. where been attained by the Engine Weaman. and Belgian enryers, with GEERTS (p. 1165) at their head (a perfect artist in wood), are advancing in the same direc-tion, and it must be allowed that the Austrian figure carving, as shown in the furniture of LEISTERR (p. 1039, 40), is much beyond onrs, while the Berlin casting and charing of small works is fast rivalling the French, and in some cases is in a much purer style. The earving of Italy is careful, but tame, and inclined to littleness; this will be seen by comparing the style of the children in Bannary's table and mirror (p. 1298), a work otherwise highly commendable, with the gusto and vigour—the larger manner and bolder treatment—of some of the French works. The children on a small scale in the hookease of HOLLAND and Sox (p. 745), which contains some otherwise good carving, show the timidity of the English art-workman when he has to deal with the figure. Some very small panels, earved in white wood, on a sideboard by J. M. sharp and thoray that to touch it would be impossible. LEVIEN (p. 751), are in better style, although very but the general want of knowledge is too appnminute, but the general want of knowledge is too apparent. This deficiency of power and skill in the human figure is only an additional evidence of the want of better education for our art-workmen. They need to have proper treatises prepared for them, laying down the prineiples of ornament, and giving them a thorough foundation in practical geometry, form, proportion, and, above all, in snatomy, together with a careful education of the hand and eye; and unless the Government and the manufacturers of this country are soon awakened to our defieiencies, and prepared to make great sacrifices, we must be content to lag still further behind as the world advances, and for the future to be manufacturers of cheap goods, leaving excellence and heanty to our continental ueighbours.

HARDWARE.

Under this head are comprised grates, fenders, fire-irons, stores, gas-fittings, lamps, and various miscellaneous applications; the whole being largely connected with ornamental design. The works in this section, however, are not more miscellaneous in their use than they are in their style of ornamention, almost every manuendeavouring to exhibit in may and every style. we have Greek candelahra adapted to many uses, Gothie ehandeliers and Renaissance lamps, with a pretty large sprinkling of the forms and ornament of Lonis XIV, and XV., to which, on the English side especially, is to be added the natural style before alluded to, which, adopting foliage or flowers as its leading idea, presents them as they grow, without any constructive or architectural since it indicates a desire for something more than mere reproductions of the antique, or that melée of ornament which the ignorant gather from many works, and reassemble without tasto or appropriateness; it at least indicates a change. In a great portion of the metal works French taste is found largely to prevail on both sides of the building, nor is this to be wondered at, since, for a long time, the lively fancy and invention of many excellent French prists have been directed to designing excellent Freeds nrists have been directed to designing and modelling for these goods; ally seconded, also, by trained and educated workmen expable of appreciating their labours, and completing them by skillin easting, chasing, and fitting. But the teudency of the French mind towards display has resulted in over-ornamentation, and it is unfortunate; that this fault is rather a mort in the eyes of the world, and has been eagerly adopted by the manufacturers of other untions, more especially of our own, that which is meretricious being retained whilst what is really excellent in French design, and especially in French workmanship, is overlooked by them, or is unattainable.

Moreover, whilst the most able French artists in metal, eschewing the gaudy style of Louis XV., have returned to a modified form of the Renaissance, and have given it somewhat of newness of character, the English designers for hardware (with a few exceptions) either still adhere to the contorted style first named, or produce works composed of ornaments pirated from all times and all nations, put together without any sense of construction, without selection and without fitness. Such works are a thorough change-modley that disgrace our manufac-turers, and make us look back to the simpler forms of the middle nges with respect and regret.

the missaic nges with respect and regret.

Let any one examine the characteristic simplicity of
the caodlestick here engraved (exhibited by Mesers,

adapted as it is for use, standing firmly, enpable of being
bandled, light, yet arong, and compare it with the showy works around it, so raged and tangled with ornament that all characteristic form is lost, branched arms bristling with foliage weighing down rather than bracing and sopporting them, with perhaps a bunch of flimsy chains dangling in the way of those who would touch or lift them, or two or three Parian Copids hasking at the foot, ur bearing up the candles; and where the hand should grasp the stem to lift the candelahrum, the ornament so The error, however, does not wholly rest with the de-

In making such a comparison can we do otherwise than feel that the one is bonest, useful, characteristic, and therefore beautiful, whilst the others are finably and grotesque, full of little prettinesses, which some mis-name "ideas," put together without any leading motivo, and having no definite character or true construction?

The faults of English design for hardware are obvious to every one; the error of the French designers is equally open to the most superficial observer. In the great mass of these works there is no rest for the eye—the whole surface is aothing but ornament. Thus, for iustance, the French art-bronzes have justly obtained a wide reputa-French art-mones have joshly omained a water reputa-tion, and the works of Denière, Pradier, Méne, and other French artists, are sought for all over Europe; but when such become a part of mannfacture, and liable to be classed as hardware, art is overlaid with ornament, and the skill of the workman is directed to that which degrades the work, and sadly militates against good taste. Thus, figures designed with much faucy, and modelled with ability and vigour, are vulgarized from the imitation of fur and of the texture of the garments, of huckles, hattons, and ties of the dress, of chain or plate armour or weapons, whilst the homogeneity of the bronze is no longer retained, but various parts of dress are treated in various tints of the metal; and all the different qualities of surface, such as tooling, frosting, and burnishing, in which it is hat just to say the workmen are most skilful, are brought into play to exrick the effect; while some-times we have, in addition, combinations of many nurterinls, such as marble, porcelain, ivory, and bronze, united in a single work.

Another class of works are those anomalous candelphia composed of porcelain vases filled with a bunch of flowers in or-moin, n few bearing candles amongst a number of burren hranches, the whole being a bush of glitter and hurnish. This is the direction which naturalism in ornament takes in France. Such works have a total absence of constructive feeling, and an equal want of proper treatment of metal; to add to their finery, an epergne of artificial flowers is often mixed up with metallic ones, as a centre-piece for the dianer-table. There are many large candelabra in various parts of the Exhibition-in France, Holland, Austria, and Russiawhich evidence the wide dispersion of French style, and contain exaggerations of the most frequent French faults.

with every other kind of manufacture with which is content incontact. The simple Incurred work of India may affect an example for the orimentation of papier wave taked from the paper of small boost in the India Department. The parely eramatestal treatment of the wave taked from the paper of small boost in the India Department. The parely eramatestal treatment of the manufact is which body find and closure redisperted over the surface, is a leasen of richness without gualities to the paper of th

Some of the greatest faults in the furniture of the Exhibition are its unsuitableness to uses, and its false Look, for instance, at the costly articles ennstruction of the Austrian rooms, and it will be found as skilful in execution as it is deficient in adaptation to its intended purposes. The bed looks more fitted for a corpse to lie in state on than for a place of repose; it is a cougeries of parts without an object: the footboard is so high and solid that it shuts in the sleeper as in a prison, and com-pletely impedes the free circulation of air; the footposts rise from massive purposeless bases, and dwindle into mere sticks as they upproach the heavy canopy; the wood selected is unanitable for carving, its party-coloured grain blurring the ornamental forms. In the other furgrain blurring the ornamental forms. In the other fur-niture like inconsistencies appear; in the cabinet large spaces are thrown away, and therefore, though occupying much room, it has little that is available for use; the centre space, with its canopy (though pretty), leas no apparent purpose, and it is quite disproportioned to the size of the wings, besides being deficient in the appear-ance of support. The bookease has the same fault of room thrown away and of unsuitableness to use, hesides being a false adaptation of Gothic stone forms to wood-This latter fault is elsewhere also largely prevalent; it is an error in most of the Belgian furniture. Thus we have a wardrobe which would be more characteristic as an oratory, and a bookcase with arches that support nothing, and huttresses which have no thrusts to resist. Indeed it should be remembered that the arch is not a wooden, hat essentially a stone construction; it will be evident, on a moment's consideration, that it is a means of obtaining support by a number of separate small parts, the reverse of timber construction. It ought, therefore, to be well considered before being used in wood, wherein it should arise rather from coupled knees or hrackets introduced to strengthen horizontal beams, than as an independent form. Its improper use will also be seen in various sideboards on the English side. In these the back consists of a mirror, over which a wooden arch is thrown; the glass having the effect of a void or opening; the thin wooden arch, bearing nothing, not only has a meagre appearance, but, having nothing to sustai its thrusts, is quite as much at variauce with the use of the material as it is with a proper sense of construction. One of the best of such treatments is seen in an elegant binet and mirror exhibited by Mr. SNELL (Class cabinet and mirror expansive by sur.

XXVI, 170), wherein a light inner column and areh,
metallized by gilding, is introduced with good effect; even here, however, the pilasters which support the outer arch seem to want brackets at the sides of their base to give more appearance of support, for the introduction of which there is ample space; the small abortive ones which are used serving only the more directly to point-

ing out this wair.

Sham construction is another error alluded to, not only
of the kind before spakes of—the suppression of the true
under prominence to uthers,—but also where these pertions which are intended for support (as, for instance,
columns in calature, tigo in indicators, &c.) are made to
columns in calature, tigo in indicators, &c.) are made to
copening the dors of the furniture. This is a common
case in calature designed in the Bensiance style, and
has the authority of some of the best antique specimens;
because it is the secure of many like errors of a more

glaring kind, as where legs are made to remove, or where the whole front of n cabinet or wardrobe is made indo doors langing to the sides without a framed facin and hanging style, and both the side and centre columns (where columns are so used as decorations) are made to worse with the doors.

move with the doors In reviewing the furniture of the Exhibition, the question of the education of the art-workman again comes prominently under review. While it must be confessed that the general design of the French works in this class are greatly in advance of our own, it is also apparent how much more widely diffused in France is that artknowledge, which, combined with handleraft, constitutes the true art-workman. Although this is peculiarly seen in works in metal, it is evident in many other brauches Wherever the human figure is used as of industry, ornament in English works, it is pretty sure to be faulty: the figure may be well composed, may be evidently designed in good taste, since that is often the work of a superior artist; hut in the execution it is almost always disfigured and spoiled. The extremities are finished without knowledge of the internal structure, the fingers, toes, and joints have no hones within the skin, but that "gummy" undecided treatment which and rance of the workman. In wood-carving this is equally apparent, even when it consists only of ornamental forms, Very often in such work the "design" of the ornament would seem to be by the same unskilled hand that carved it, since it is mostly out of place, coarse and merely "natural" in style, and rarely reaches beyond the expression of the most commonplace thought, or the imitation of the commonest fruits and flowers. That great power of imitation and skill of hand, however, are not wanting in the English carver, is evident from many examples, and is particularly shown in the beautiful and delicate flowers, &c., of T. W. Wallis, of Louth (Fise Art Court, Class XXX, 89, 9, 825, which are quite equal to the French works in the same style; but even these goo further than imitation, and the human figure cannot be carved by a merely imitative process :-- success in rendering either the human figure or animals when in life and motion can only he the result of knowledge attained hy a careful study of the structure of the bony framework and of the moving mucles; and it is the want of such anatomical knowledge and of a proper training in art that causes the deficiency we are obliged to notice in the English Department, and compels the carver to confine himself to mere works of imitation, knowing that The two figures in the front of the cabinet of RINGUET

LEPRINCE (p. 1245), for instance, are unapproached by anything in English furniture; as is the rare excellence of the earvings on the sideboard of Foundinois (p. 1236). and the works of LIENARD (p. 1239). Even where the figure has had a partial study, the imitation is often cold and "mannered;" the letter is followed rather than the spirit, and it is almost impossible to find a workman entering into the feeling and spirit of the artist-designer, and treating the work in a good and bold style. bronzes of men and animals are perfect instances, in French works, of the power of the workmen to cuter fully into the feelings of the artist, and to appreciate style and intention, but the same union has hardly anywhere been attained by the English workman. The Belgian carvers, with GERRTS (p. 1165) at their head (a perfect artist in wood), are advancing in the same direction, and it must be allowed that the Aostrian figure carving, as shown in the furniture of LEISTLES (p. 1039, 40), is much beyond ours, while the Berlin easting and chasing of small works is fast rivalling the French, and in some cases is in a much purer style. The carving of Italy is careful, but tame, and inclined to littleness; this will be seen by comparing the style of the children in Bannerry's table and mirror (p. 1298), a work otherwise highly commendable, with the gusto and vigour-the larger manner and bolder treatment-of some of the French works. The children on a small scale in the bookcase of HOLLAND and Sox (p. 745), which contains some otherwise good carving, show the timidity of the English art-workman when he has to deal with the figure. Some very small panch, carred in white wood, on a sideboard by J. M.
LEVIES (p. 751), are in better siyle, although very
minute, both the centerl want of knowledge is too opport
rent. This declevery of power and skill in the human
fleered is not an obliterial evidence of the wrant of better education for our art-workmen. They need to have proper treatises prepared for them, laying down the principles of ornament, and giving them a thorough foundation in practical geometry, form, proportion, and, above all, in santomy, together with a careful education of the hand and eye; and unless the Government and the manufacturers of this country are soon awakened to our deficiencies, and prepared to make great sacrifices, we must be content to log still further behind as the world odvances, and for the future to be manufacturers of cheap goods, leaving excellence and beauty to our continental neighbours.

HARDWARE,

Under this head are comprised grates, fenders, fire-irons, stoves, gas-fittings, lamps, and various miscellaneous applications; the while being largely connected with oranmental design. The works in this section, however, are not more miscellaneous in their use than they are in their style of ornamention, almost every manufacturer endeavouring to exhibit in any and every style. Thus we have Greek candelabra adapted to many uses, Gothic chandeliers and Renaissance lamps, with a pretty large sprinkling of the forms and ornanient of Louis XIV. and XV., to which, on the English side especially, is to be added the natural style before alluded to, which, adopting foliage or flowers as its leading idea, presents them as they grow, without any constructive or architectural arrangement whatever. Yet even this is encouraging, since it indicates a desire for something mure than mere reproductions of the antique, or that wile of ornament which the ignorant gather from many works, and reassemble without taste or appropriateness; it at least indicates a change. In a great portion of the metal works French taste is found largely to prevail on both sides of the building, nor is this to be wondered at, since, for a long time, the lively fancy and invention of many excellent French artists have been directed to designing and modelling for these goods; ably seconded, also, by trained and educated workmen capable of appreciating their labours, and completing them by skilful casting, chasing, and fitting. But the tendency of the French mind towards display has resulted in over-ornamentation, and it is unfortunate that this fault is rather a merit in the eyes of the world, and has been eagerly adopted by the manufacturers of other nations, more especially of our own, that which is meretricious being retained, whilst what is really excellent in French design, and especially in French workmanship, is overlooked by m, or is unnttainable,

Moreover, whilst the most able French artists in metal, eschewing the gaudy style of Lonis XV., have returned to a modified form of the Rennissance, and have given it somewhat of newness of character, the English designers for hardware (with a few exceptions) either still adhere to the conterted style first barned, or produce works composed of ornaments pirated from all times and all notions, put together without any seuse of construction, without selection and without fitness. Such works are a thorough chance-medley that disgrace our mannfue-turers, and make us look back to the simpler forms of the middle ages with respect and regret.

the middle ages with respect and regret.

Let any one examine the characteristic simplicity of
the candlestick here engraved (exhibited by Messra,
Harddan, 523, p. 76), from a design by Mr. W. Pugin),
adapted as it is for use, standing firmly, capable of being
handled, light, yet strong, and compare it with the showy works around it, so rosp, d and tangled with ornament that all characteristic form is lost, branched arms bristling with foliage weighing down rather than bracing and supporting them, with perhaps a bunch of flimsy chains dangling in the way of those whu would tonch or lift them, or two or three Parian Cupids basking at the foot, or bearing up the candles; and where the hand should grasp the stem to lift the candelahrum, the ornament so The error, however, does not wholly rest with the de-

In making such a comparison can we do otherwise than feel that the one is honest, useful, characteristic, and therefore beautiful, whilst the others are flashy and grotesque, full of little prettinesses, which some misname "ideas," pat together without any leading motive, and having no definite character or true construction? The faults of English design for hardware are obvious

to every one: the error of the French designers is equally open to the most superficial observer. In the great mass of these works there is no rest for the eye—the wholo surface is nothing hut ornament. Thus, for instance, the French art-hronzes have justly obtained a wide reputation, and the works of Denière, Pradier, Mene, and other French artists, ore sought for all over Enrope; but when such become a part of manufacture, and liable to be classed as hardware, art is overlaid with ornament, and the skill of the workman is directed to that which degrades the work, and sadly militates against good taste. Thus, figures designed with much finey, and modelled with ability and vigour, are vulgarized from the imita-tion of far and of the texture of the garments, of buckles, tion of tur and or the texture of the garments, of ouchies, the third of the dress, of chain or plate armour or weapons, whilst the homogeneity of the bronze is no longer retained, but various parts of dress are treated in various tints of the metal; and all the different qualities of surface, such as tooling, frosting, and hurrisbiling, in which it is hat just to say the workmen are most rkilful. are brought into play to earich the effect; while some-times we have, in addition, combinations of many materials, such as marble, porcelain, ivory, and bronze,

united in a single work. Another class of works are those anomalous candelahia composed of porcelain vases filled with a banch of flowers in or-molu, a few bearing condles amongst a number of barren hranches, the whole being a bash of glitter and burnish. This is the direction which naturalism in ornament takes in France. Such works have a total ornament takes in France. Such works have a total absence of constructive feeling, and an equal want of proper treatment of metal; to add to their finery, an epergne of artificial nowers is often mixed up with metallic ones, as a centre-piece for the dinner-table. There are many large candelabra in various parts of the Exhibition—in France, Holland, Austria, and Russia which evidence the wide dispersion of French style, and contain exaggerations of the most frequent French faults.

signer, since it will be long before he has a public suffi-ciently educated to relish the amount of plainness which is absolutely necessary to give the true value to each part enriched

Grates.-Grates rank among the principal works in hardware to which ornamental design is applied, at least on the English side, and there by far the best specimens both as to design and workmanship are to be found: this was to be expected from the general necessity for warmth in our cold and variable climate; an Englishman's love in our cold and variante climate; an Englusaman's sove for his fireside having passed into a proverb. It is grati-fying also to see that the design and decoration of these goods have greatly improved in the last few years. Some works of great merit are to be found among those exhibited, while the workmanship generally is excellent. There is, however, an evident tendency to do too much, and it is incumbent on designers for such goods carefully to avoid this, and to endeavour to restrain manufacturers from such treatments of the metals as lead to gaudiness glare, and by which, at the same time, the grate itself is rendered less nacful. The great secret, after constructive use has been considered, consists in the pro-office as an article of furniture, while it displays most per and judicious treatment of the materials, which offer judicious use of the materials. The face is of ground

great advantages for contrast, either with or without the introduction of bronze or or-molu. True excellence will be found to be closely allied to simplicity—a moderate use of ornament and of the burnisher, and the contrast of broad flat masses of plain metal with ornamented or burnished mouldings, with inlays of brass, or with bronze and or-mole ornaments. The arehed form which has generally been adopted for grate-fronts is architecturally snitable and agreeable in outline, giving ample oppor-tunity for ornament in the mouldings of the arch, as well as in the spandrels, besides having sufficient surface of metal to contrast with; moreover, it is not likely to interfere with the architectural arrangement of the mantel-piece to which it may have to be fitted. Messrs. interfere with the architectural arrangement of the mantet-piece to which it may have to be fitted. Mesars. Romou and Hoota (Class XXII., p. 699) exhibit several grates designed by Mr. A. Stevens, highly decorative in character, and of great general merit; two especialty, fronting on the Contral Arenue, designed in the Rensissance style, evince great artistic ability. The one cagraved, however, which is exhibited by them, is more

east metal, the ornamented moulding of pale bronze, with the leafage of brass, and the figure bronzed, while some semi-burnished lines about the fire give a very chaste and tasteful effect; the fender is also of bronze and brass, with the leading lines harnished. Much more ornament than this would raise the grate out of its right place in the scale of furniture, and draw under attention to it; its sober simplicity is more to be commended than many of the very highly ornamented grates around it. Messrs, STUART and SMITH (p. 603) have also some meritorious works as to design, but from the excessive intro duction of burnished surfaces the graves look too fine for use. Messrs, Hooles have avoided this hy a large introdoction of the ground metal, which contrasts excellently with either hurnished or brass ornaments, and adds to their beauty by its own repose and sobriety. It can never be too much insisted on, that ornament loses its value when it overloads a work, and that large unornamented spaces are required to enhance and give zest to the decorated parts. As we descend to grates designed by inferior artists, we find excess substituted for excellence, and works of such brilliaut gaudiness of surface

as to be quite unfitted for their intended use; indeed, the process of keeping them in order would seem to require that a whitesmith formed part of our establishment, or that the housemaid should have a practical education to enable her to take to pieces the elaborate constructions which would come under her care, inde-pendently of the skill required to clean them. Messrs. Stuart and Smith have made attempts at the combination of materials with some success, and have also some

cleverly designed metallic inlays for hearths It is tiresome to repent what has so often before been said, that use ought to be considered before ornament; yet no section of furniture suffers more from neglect of yet no section of institute states and the section this rule than that comprised under hardware, not only in the works exhibited in the British, hat in all parts of the Exhibition. In some cases this shows itself in applying a form or construction snited for one use, to another for which it is quite inspplicable. Thus some chandeliers in the French Court, which at first sight seem cleverly designed, and a skilful treatment of the metal, on exam nation are found to consist of a large central lamp, which alone is intended to give light, surrounded by a circle of branches bearing sham candles, not intended or prepared in any way for illumination, but introduced merely to allow of a little extra ornament. From the same cause results the impertment opplication of figures, in bronze or in Parian; a fertile source of bad taste. These are to often merely added to the work, and not construc-tively treated, and thus seem to have no real relation to the forms they are connected with. Hence the mann-facturer is embled to adapt the same figure to many purposes, and to the most opposite uses; sometimes at the base of a chandelier, sometimes at the top, and some times perched upon the branches. Profitable to the manufacturer this may be, but it is as completely opposed to every just principle of design as to every hope of progress or good taste.

In the treatment of metal the rendering of the surface demands the most caveful study, since much of the beauty of a work results from this being properly under-stood. No don't the true lustre of metal is only given in the burnished state; but when harmishing is intro-duced in any quantity, it becomes not only tormenting to the eye but wants contrast to bring out its hrilliancy. Moreover, hy its glitter it obscures ornamental forms, which rarely look sharp or clear in their details under this treatment. When figures or animals, introduced for decoration, are burnished, their true form is almost undistinguishable on account of this glitter and the reflec-tion from the polished serface, besides the pressure of the tool completely destroying all details of form and the tool completely destroying all details or torus and surface. Yet many important works (a elock in the Bassian Court may be especially instanced) have the figures entirely burnished. The evil caused by a glit-tering surface in such works is duly appreciated by the Freech artists, who have wisely adopted bronze as the material for figures in the baser metals, and have overcome the difficulty by oxidation in their works in silver, A medium state of the surface between mat and hur nished, though much to be desired, is not always obtainable, nor has it perhaps been sufficiently sought. Bronze, however, from its colour, partially supplies this want; and the mixed metals, and ground east iron from its duller polish, afford good contrasts to burnished iron or steel.

While our use of burnish often tends to hlur and destroy form, the older workmen took advantage of a stroy form, the owner workmen took havanings of a polished surface to produce ornanciat; this may be seen in some of the old church chandeliers, of which the central truth, consisting of a plain turned box, seems richly reeded when the branches are lighted, merely by the reflection of the lights on the metal. In most of the modern works, burnished and matted surfaces seem to be used indifferently or at random,

instead of applying the burnisher to give variety to recurring forms, or to enhance leading lines. These are often entirely matted or tooled, and those parts hurnished which will give the greatest flutter and glitter to the

The natural taste in connexion with the orname bardware has already been condemned. It is as false in construction as it is to all just ornamental principles.

The facilities which modern mechanism gives to the production of ornament, and consequently to over-ornamentation, have also been adverted to in the earlier parts of this Report. It is to be hoped that in view of these facilities mannfacturers will see their own interest, and seek the best designs at any cost, since these will frequently be found to combine cheapness of production and simplicity with good taste. There can be no donht that half the ornament in the Great Exhibition, and consequently the labour expended on it, is in excess; that is to say, that a better effect might have been produced without it; and this wasted labour might have been bestowed on the more careful completion of simpler designs, to the curiching of the manufacturer, and the great advantage of the public taste.

CARPETS.

rather to treat the whole as a background than to call particular attention to the ornamentation. Flatness should be one of the principles for decorating a surface continually under the feet: therefore all architectural relief ornaments, and all instations of fruit, shells, and other solid or hard substances, or even of flowers, other solid or hard mbstances, or even of flowers, strictly speaking, are the more improper the more imitatively they are rendered. As a field or ground for other objects, the attention should hardly be called to carpets by strongly-marked forms or compartments, or hy violent contrasts of light and dark, or colour; but graduated shades of the same colour, or a distribution of colours nearly equal in scale of light and dark, should be colours nearly equal in scale of light and dark, should be adopted; secondaries and tertiaries, or neutralized primaries, being used rather than pure tints, and lights introduced merely to give expression to the forms. Under such regulations as to flatness and contrast, either geometrical forms, or scrolls clothed with foliation in any style, leaves, flowers, or other ornament, may be used, which with borders and compartment arrangements, and the use of disper treatments, leave sample room for variety and for the inventive skill of the artist. It may be thought impossible or unnecessary to confine the de-signer too strictly by such laws, and they are, indeed, rather stated from a sense of their truth than with an immediate hope of their thorough acceptance; but at any rate they may serve as curbs to extravagance of design, and as guide-marks to lead back the errant designer to the path of consistency. In speaking of designs for these articles we turn first to France, both as the largest contributor of designs generally, and because the importance of her national manufacture of these fibries must claim for them our first consideration. Three of her principal ornamentiats exhibit designs for carpets; two of them, however, seem to consider any such principles as those given entirely unnecessary: their works might as well be florid designs for the decoration of ceilings, if such a false system could be applied anywhere. Thus one of the most important carpet patterns of one of these artists bears a deep border of architectural decoration shaded in relief, consisting of shields and serolls, of the standed in rener, containing or surcoss and second to the Louis Quinze period, with wreaths of flowers rendered imitatively and in perspective. This border seems thrown downward, to form a reversed coving; within torown downware, to form a reversed coving; within the field of the carpet, as in a mirror, is a forest, with the sky seen through the central opening between the branches, whist amorini, almost as large as tha trees themselves, sport beneath their shada or float in mid-air. The principal work of the second is of a like character, with trees and flowers, fonntains and statues, earth and sky, mingled on the surface of the design, in total conrayention of those laws which have been presoned to be just ones for such a purpose. The third artist, M. CLERGET (p. 1219), both in his carpet and in his other designs, forms an honourable exception. Flatness, a just ornamentation, and a quiet distribution of colour being the consistent results of his laboura. With regard, however, to the two former, it would be unjust not to speak of the great executive skill, the knowledge, and elever arrangement observable in their works. These, however, hy their attraction, only increase the evil such designs foster. The results of such false principles are apparent all over the Exhibition, and are plainly visible in the carpets and hangings exhibited by France. To begin with the establishments which, nuder royal or national aid, have carried these fabries to the highest pitch of ex-cellence in all that relates to skill of manufacture, brilliancy of coluur, and magnificence of design. In the face of the many and rare excellences they exhibit, both of handieraft and scientific knowledge, the chemist and the handicrart and screening anywrouse, and the invention and tasts of the painter, it is extremely daring to reprobate the ornamentation of these costly works; but the designers who have laboured for them have, by these y excellences, so largely contributed to the spread of bad taste and false principles in such fabries, that it becomes a positive duty, in the face even of the highest The use of these fabrics suggests the trae principle of authorities, to object to the principles on which they are design for their commentations, which is governed by the ornamented, if we would place carpet designs on the laws before given for flat surfaces, where the object is "ight footing for the future. That he stream is impure at the fountain head has been shown in reviewing the de igns, where the artist, exhibiting what should be speeimens of his own taste, has fallen into the false taste of the public, or rather outran it. In the manufactured coducts we see the result; the principal carpeta exproducts we see the result; the promonent with natural or imitative flowers, designed with the greatest skill, coloured with the tints of nature, and gracefully and tastefully disposed; the ornament however, is purely architectural, and in shaded relief, without any sense of flatness; and consists largely of the broken curves, the coarse scrolls, and the shell forms of the Louis Quinze period. In the carpet from the manufactory at Augusson (France, 1199,) the contrasts of colour, both as to tints and light and dark, are of the most violent kind; dis-tressing the eye, and distracting the attention from any works which might be in juxtaposition with it. The carpet from the Gonerans Manufactory is less objectionable in its contrasts of light and dark, and is highly skilful in its arrangement of colour, but it has the san erroneous use of it, the same adoption of the ornament of another material, the same florid taste and want of flatness. It may be said that these works, designed for the gorgeous magnificence of palaces, can hardly come under sober rules; that they are essentially intended for display. Even allowing this to be the case, such specimens may well serve as warnings of the danger of adopting the like style for more general men; and even in a palace, the chaste simplicity of its statues, and the subdued bucs of the works of high art which should adorn it, could stand little chance of vying with the richness and Instre of fabrics so over-decorated; and the princely inhabitant would certainly share the attention of the spectator with the gaudy carpet which covered the floor.

The Equith designers contribute less in the Pathician time that Per and implement, and allowed their works in a far more solver and just time. The designs with its a far more solver and just time. based any designs.

In training attention to the manufactured goods, they have a possible to exhibit such a total wast of consistency asyste, and to exhibit such a total wast of consistency as a menular to make a first possible to the state of these principler which it is at one excited the designers, below a home and abroad, are amenally to most of these principler which have been a state of the state of waste a consistency of contract soft the state of waste as a state of the sta

The French designs applied to earpest are largely elameterically by works already remarked upon, the pressing faults of these being the prevailing faults of consumer, perspective tentaments, such of fautures (realnous of colour, handness of contrast, and wno for relative scale) in the comman, pereasing the greate number of the colour, handness of contrast, and wno for relative scale in the comman, pereasing the greater number of XATONAS, MANTERCHOUR ALLEATING, from their flatness, quiet contrasts, and broken have of negative colour, show to great advancage in connexion with the works exhibiting follow are competitively for distributions.

in their national workshops or to the general labours of their manufactures. The prevailing taste of France seems to be that of the Continent generally, but with lees excellence of denils, skill of arrangement, and koorledge of art; and although here and there works of nuch nerit may be exhibited, the absence of true principles is everywhere apparent. The English carpet manufacturers are large exhibitors,

and on the whole the determine of that he good may be characterized as the extrawagant that the freign ones, be characterized as the extrawagant that the freign ones, would principles, or complete repulsation of faire ones, would principles, or complete repulsation of faire ones, would principles, or complete repulsation of faire ones, and the contract of the cont

land the bouler is about half in width to marrow for the centre, but this is not an inter woods; the colour of the centre contents of graduates of a neutral red, the centre of the centre content of graduates of a neutral red, the width of the centre cen

Turkey, and it is only necessary to turn to them from the surrounding works to be convinced of the justness and truth of the Eastern style and application of colour to such fabrics; judged a most careful examination has confirmed a strong feeling as to the great superiority of the designs of Indian and Turkish curpets, both in the arrangement and general tone and harmony of the colours, and the first treatment and geometrical distribution of form. The Turkish earpets are generally designed with a flot border of flowers of the natural size, and with a centro of larger forms conventionalized, in some cases eve : to the extent of obscuring the forms, a fault to be avoided. The colours are negative shades of a mediana or half-tint as to light and dark, tending rather to dark, with searcely any contrast, and therefore a little sombre in character, Three bues predominate and largely pervade the surface, namely, green, red, and blue; these are not pure but negative, so that the general effect is cool, yet rich and full in colour. The colours, instead of eutting upon each other, are mostly bordered with black, the blae has a slight tendency to purple, and a few orange spots enhance and enliven the effect. The distribution of colour in these fabrics is far simpler than in those from Judin, which last have sometimes a tendency to foxiness, from a larger admission of warm neutrals, as hrown and brown purple; they also admit of a much greater variety of colours than the Turkish. The colour of the Indiau carpets, however, is so evenly distributed, and each tint so well balanced with its complementary and harmonizing hue, that the general effect is rich and agreeable; the hues all tend to a dark middle tint in scale, and white and yellow are sparingly introduced to define the geometrical arrangement of the forms, such arrangement being the sound basis of all Eastern ornameut. The illustration given in Fig. 1, Plate 1, is from an Indian rug, and will illustrate the various principles, and the tone of colour contended for. A large silken earpet and a smaller one, exhibited by the Honourane THE EAST INDIA COMPANY (p. 917), are fine examples of the skill and taste which are evidently traditional in the Indian races.

Having spoken thus highly of the decoration of such goods in Judia, it is painful to observe the attempts ignorantly made to vitinte the sound taste of the native artists It has no doubt been done by those who are unaware of the true knowledge and just principles evident, more or less, in all the Indian manufactures; but it is not the less necessary to be commented ou, since a school of industry seems actually in operation at Jubbulpore for teaching the reformed Thugs to make carpets in the worst European style, and at Bangalore the same teaching seems in operation. It is to be hoped that, when the admiration elicited by the display of the Indian fabries at the Great Exhibition is re-echoed back to the land that produced them, this strange error will at mee be remedied. Even if good, such patterns are not consonnet with Indian tastes, and it is perhaps fortunate that they are really so extremely bad that they may fall at once before the better knowledge which the European judgment of the

merit of Indian ornament will call forth and support. The gross errors to which imitative trentments hav led in the decoration of earpets have been already referred to in the general prefatory remarks, and need hardly be insisted on afresh after the definite principles which have been Jost given; neither need more be said on the error of adopting unchanged the ornameot of other materials; it therefore only remains to remark that a certain vaga ness of form and absence of flow of line in the Turkish carpets, which sometimes approach monotony, might be remedied by the introduction of strap ornament in the borders, and of dispers of fint floral ornament on the central field, under the same true principles of colour and contrast that these works evince, which, uniting the flowing and varied lines of European decoration with sound Eastern taste in tone, colour, and geometrical arrangement, would sait our climate and uses, and barrish some of that trash and erndity so evident on all sides, and which has its climax in the cheap manufactures of these articles. One thing is certainly to be learned from the works referred to, namely, that bright colours are not | are by the duiter ground, while smaller parts and variet

necessarily rich or heantiful, but that tone is a great source of richness, and has nt the same time the farther merit of keeping such goods in their true place in the scale of furniture. No natious exhibit greater richness of what may be called apholstery, or more gorgeous costumes, than those of India and Persia, and the wisdom displayed in the negative tone and subdued colour of their earpets is worthy of consideration, as a means of enhancing and supporting the richness and costliness of their other fabrics and their personal decorations Almost all that has been said of carpets is applicable to

druggets and felted goods for the same uses, and the principles of their ornamentation, under certain modifications, may be applied to floor-eloths and painted cloth for furniture covers, as well as to printed, felted, and woven fabrics, in various materials, for table-covers,

Floor-cloths are not so much used in this country for dwelling aparements, as in halls, staircases, lobbies, and other approaches, and richness and fulness of colour are, therefore, in general, less needed. The laws which reculate mosaics and inlaws for floors will, in some degree, rule these works also, execut that word inlays, especially when large, require a design capable of being framed in its construction, and of having due regard to the shoulderings of mortices and tenons, a construction obviously unnecessary in floor-cloths. It is, therefore, requisite to guard carefully against mere instintions of such designs, and more especially to avoid all initations of carpet patterns. Frets and guilloches for borders, and geo-metrical combinations for the inner field, with n centre, may be adopted when the work is large, as in the cloth exhibited by Messrs. SHITH and BARES (Class XIX., 37). p. 573), which has much merit, although it is too violent in its contrasts; while all-over patterns of simple geometrical dispers, in quiet, graduated tints, have the best effect in eloths for general purposes. The pointed cloths for furniture follow a little too much the old Japan colouring, and are heavy and monotonous from their darkness. There are good dispers on some of the Freuch eloths exhibited, and on some of those of Gönning and Bönner, of Leipsic (3 Zollv., 164, p. 1111); but their cloths for the ceilings of carriages are wormy in line and unpleasantly crude in colour. The table-covers in woollen, ton, flax, and silk, either woven, printed, or felted, of which there are a great variety in the Exhibition are often characterized by the same finits as the carpets imitative flowers and architectural relief ornament, with vases, baskets, &c., forming too frequently the details, whilst the contrasts of colour are sometimes of the most wildest kind. Thus there is great richness in a cloth with a border decorated with the flowers of the Bruemansin, exhibited by WHITE and Sons (Class XIX., 343, p. 572), but the requisite flatuces is not obtained; and p. was the requisive natures is not obtained; and there is much merit in a Gothic pattern, with a well-coloured border, exhibited by II. and T. Woon (Class XIX., 352, p. 572), but the architectural decoration introduced is objectionable.

CUSTAINS AND HANGINGS,

The ornamentation of textile hangings follows the same laws, and is amenable to the same general principles, as that of other wall decorations, flatness of treatment and subdued contrasts of colour being the only sure guides.

The richest, and nt the same time the most sober effects in silk, are produced merely by the processes of weaving, as of satis figures on a tabby ground, in a self-colour; and ornament properly suited for this treatment of the silk is generally in good taste, and shows the full spleadour of the rich material. Next to this, graduated tints of a self-colour, as gold on straw colour, or even ornament io one colour, on a ground formed of the materal golden tint of the silk, where the contrast is not too violent, has a good effect, and shows to advantage beside those over-decorated works which are covered with natural flowers in many colours; since the lustre and gloss of the silk, and the richness of colour consequent on these qualities, are seen to the greatest advantage in the flat masses of such ornament, heightened as the

tints interfere with these inherent qualities of the ma-

terial. A hanging exhibited by Messra. MATREVOX and Bou-Vann (France, 1349, p. 1240), decorated with bunches of flowers, on an ash-colonred lilac ground, displays great ability in the designer, combined with thorough knowledge of the powers of the loom, and it has been executed with equal skill by the weaver; it is, indeed, a choice example of the style; yet its lustre and beauty, and fitness as a hanging or eurtain, are not commensurate with the costliness of its production, and it cannot compete for apparent richness of material with a plain mulberry-coloured hanging, ornamented fintly in satin and tabby, that hangs beside it. Ifad these flowers been treated fintly, arranged geometrically, and coloured in simple tints, they would not have been so artistic, but they would have been far more truly oronmental, and more suitable for hangings.

There are some well-designed fubrics among the Prussian silks, exhibited by G. Gabata (Zollv. (1), 119, p. 1055), consisting of an heraldic treatment of the p. 1053) consisting of an heraldic treatment of the Prussian cagle, on a red ground, with the ornament in gold. The slik hangings of the Austrian bed are likewise in good taste. With these must be named the hangings of the Medigwal Court, and those in mixed materials, executed for the Duke of Devonshire by Messra. Rev-posed to the control of the property of the control of the policy of the property of the control of the property of the control of the policy of the property of the property of the control of the property of the proper NOLDS, of Dublin (Class XII. and XV., 266, p. 498, 499), consisting of fleur-de-lys and shamrock, in silver, on a subdued crimson ground, or in gold-coloured silk, on a watchet ground. The hangings decorated with ornaments from the Alhambra, exhibited by A. Dastranex and Co. (France, 164, p. 1181), are in good taste and on good principles, as are also some in mixed fabrics, in the same style, by Agnovn and Co., of Halifax (Class XII. and XV., 130, n. 491) , 130, p. 491).

The mirrord irentress of flowers as the occasions of extractile fibrics is notwine use to greater diabetassing extractile fibrics is notwine used to greater diabetassing extractile fibrics in solven were a second or solvent and provided the property of the composition of the com

truth and good taste.

Growing the state of
that, on the contrary, fresh and cool light grounds, with flat ornamental forms, either "all over" or in "up and down" boods, or dispers of floral ornament, on a simple texural ground, are the true principles for the decoration of chintees.

Before completing this Report on farniture, it is nesary to say a few words on muslin certains, of which there is a large display in the Exhibition. These fabrics should, of course, have a perfectly flat treatment, whether urely ornamental forms or flowers are used for their decoration. The best effect for borders is obtained by a symmetrical arrangement of flowing lines, which may be large in pattern, from the lightness of the unterial : while a disper treatment, or small sprigs arranged with large and regular spaces over the central field, are the simple rules for their decoration. It would seem hardly possible to err much in designing for a fabric which admits of such small variation, the contrast of the thick work with the more filmy ground being the source of the ornamental form, and colour being rarely used; yet, perhaps, in the whole Exhibition, there are not more glaring mistakes than are made in the decoration of these goods. In the Swisa muslins, the effort seems to have been directed rather to curious skill in workmanship than to taste in design, and some of the most costly goods are in the worst conceivable some or une most costly goods are in the worst conceivable taste—immense cornucopias, pouring out fruits and flowers, palm-trees, and even buildings and landscapes being used as ornament. Even when this only consists of flowers, they are used imitatively and perspectively, foldings of the leaves, and in some enses the actual relief of fruits, being attempted. Although the same faults occur in the English manufactures, these, on the whole, slightly incline to better taste, especially in some of the woven curtains from Nottingham, and in the fabries exhibited by the UTREERT COMPANY (Class XIX., 265, p. 570), but there is a sad want of good design in this class

Except that curtains allow of an "up and down " treat-ment, which table-cloths do not, most of the same rules apply to damask table-linen as to white maslin curtains, The ornament of damask lines arising, as it does, merely from the gloss obtained by various distributions of the warp and woof in weaving, ought to be extremely simple in form; yet even in these goods we find buildings, landscapes, vases, baskets, fruits in relief, and flowers perspec-tively treated as the details of decoration, while one designer treety treated as the destine of decoration, while one designer has copied a centre-piece of precions metal, the property of H.R.H. Prince Albert, in the table-cloth apon which it is meant to be placed. These faults are present, not only in the Irish linens, but in those of France and Soxony slao. There is a good design, in the German Gothic style, applied to a cloth exhibited by D. BIRBILL. (Class XIV., 27, p. 511), and some well-considered adap-tations of Greek ornament in the lorders of some damasks by A. H. C. WESTERMAN and Sons, of Westphalia (1 Zollv., 544, p. 1081); but the general manufacture of such goods serious revision. A border of fist ornament, consisting of flowing lines or flat floral treatment, earefully studied as to the distribution of quantities; a disper geometrically arranged over the inner field, either of floral or ornamental forms, with a judicious interspace (the disper being rather dispersed than crowded), and a central duper leung mitter dispersed than crowded), and a certification that the control of the control simple and self-evident, there are few manufactures where a greater amount of error prevails, the nearest approach to purity of style being floral treatments, imitatively

In concluding our remarks on the design of this section, it is worth calling attention to the different relative importance, io an oranmental point of view, of the various articles which are comprised under the head of the furniture of an apartment. These are the work of various manufacturers, each endeavouring to give the greatest and the production of the production o

rendered

amount of decoration to his own works, without duly considering their relation to other harlors. Thus the carpet mannfecturer ornaments his articles so showly that they outsite the hangings—the will decorate, or paper-stainer, his goods, till they emalate the cabinet furniture—whilst the apholestere overlays his abave of the furniture with fortic carrier, with or-most and inkeys, or the contract of the horosatt, the employer, or the palatent, or which they are mingled.

All this arises out of error; each article of furniture has a due share of importance—a relative value as deco ration-beyond which it should never be forced; and the designer for each should have this truth strongly impressed on him in all his labours. We may suppose it easily conceded that the carpet, bearing the relation of the groundwork for objects, should have a quiet richness of surface and texture, intruding in the least possible degree on the eye or the observation; the wall decorations, the next in importance, being entirely of the nature of a background, should be subordinate to the cabinet work, which, in its turn, should hardly be forced into undue competition with the skilful works in glass, porcelain, metal, or the fine arts, for which it serves merely as a means of display or arrangement. Yet how often is this order entirely reversed, and the simplicity of fine art out-shone by the gorgeousness of mere furniture! Where the educated taste of a decorative artist is not sought for, this too often arises from want of taste in the purchaser, who selects each object for itself, and not on full consideration of this principle of subordination; but were the designer really alive to the truth of the principle, such gaudy and false ornamentation would hardly be applied to inferior fahries. Jewellers are eareful that the setting be a proper foil to the more valuable stone, but those who have the means of richly decorating their dwellings often make such a show of the setting that it overpowers the gem.

Div. 3.-Domestic Uteneils and Objects of Personal Use.

The third section of this Report is devoted to the examination of design applied to domestic ntensils and objects of more immediate personal use. Although there is not any exact line of demarcation between such works and those more properly ranging with domestic furniture, the division is sufficiently accurate, and is convenient as permitting classification under the separate heads of

- 1. Porcelain and pottery.
- Table and ornamental glass.
 Works in the precious metals, &c.
- 4. Bookhinding.

 It is to be remembered, however, that the Report has

It is to be remembered, however, that the Report has reference only to the decorative art applied to such works, and that unormamented objects of utility are consequently not included.

It will at once be criticat, that whateve is compensated in this extension only its display the greatest parties predict in this section only its display the greatest parties of form and the reset excellences of ornament, while they should be characterized by the tomost refinement and family, since they are daily under our heads, and until the contract of the cont

Moreover, in those clauses in which use is a first requisition as is largely the case in china, pottery, and requisition as in largely the case in china, pottery, and represent the control of the control of the control of the greatest convenience and especial control of the control of means of lifting, holding, unporting,—of filling, ampriing, and cleaning, should regage the attention of the designer, before the subject of their ornamentation is at all entered upon

PORCELAIN AND POTTERS' WARE,

There is hardly any nation, however primitive its state, with whose works we are acquainted, that has not unambered among its manufactures some kind of potters' ware; rudely made and harbarously decorated perhaps, and imperfectly fired, hut sufficient for the simple dometic purposes of people in an early stage of society and civilization.

As natious advanced in enliture, their pottery improved also, both in elegance of contour, in benaty of decoration, and in manufacturing excellence; so that fletile fabrics almue will often mark the standard of national civilination, and indicate the progress of a people in the arts of life.

This has been the case not only with the Greeks and the Zustern anticolor, has with the modeling Patryanment of the Control of the Control of the Control of the in antispersion that in Europe the improvement of these in antispersion that in Europe the improvement of these the perfection of the Control of the Control of the Control of the Europe that the Control of the Control of the period of the first impulse to excellence, the was keeply excellent an notice that the potenty fundating verices the tame of the time; that the potenty fundating verices the tame of the time; that the potenty fundating verices the tame of the time; that the potenty fundating verices the tame of the time; that the property of the control of the tame of the control of the Control of the Control of the anti-outer of the control of the Control of Locis XV. In the same way, when the Interiories court of Locis XV. In the same way, when the Interiories court of Locis XV. the same way, when the Interiories court of Locis XV. the same way, when the Interiories court of Locis XV.

factor In this view of the cerumie arts there is much that is hopeful in their present position, since not only is there a manifest progress in the last few years in the general manufacture of porcelain and pottery, both at home and abroad, but a decided improvement in their decoration. We seem to have nearly passed through the stage of mere imigation; the antique has been carefully studied, not so much with a view to the mere reproduction of the elegant forms of its ntensils and of their decoration (too much the custom during the latter end of the last and the commencement of the present century), as, from the examination of the vases and tarzas of antiquity, to obtain the geometrical bases of their construction, and the principles on which the Greeks applied ornament to their surface. Hence has resulted an improved elegance and refinement in modern porcelain; and the beautiful details refinement in mouern porceins; and the behavious creams of Moresque ornament, or the richness and elegance of the Renaissance, have been adapted to its decoration on the same just principles that guided the artists of Greece and Etruria in ornamenting with their own national and significant ornaments the beautiful works which time has

repared for our admiration.
The designs he presents or pottery are few in number The designs he presents of extendents, and in the present Reports need not be addeducted in the second of students, and in the present Report need not be addeducted to the second of the s

of the manufacture. This is nowhere more evident than in the heautiful and valuable collection of porcetain exbibited in the Sèvres Court, the products of that eclehrated manufactory. There is not a more interesting department in the whole Exhibition, nor one which more fully illustrates the wisdom of a judicious application of the best art to manufacture. Here we find the taste of the first artists assisted by the science of able chemists, and, under a judicious direction, united to the most skilful workmanship and maunfacture, and the result is that the fabrication of porcelain is carried to the highest state of excellence. The greatest part of the display, however, consists of works which must be classed as ornaments, such as vases, caskets, chalices, tazzas, &c. The forms adopted are pure, and those pure forms rarely interfered with by the reliefs. The details of the decoration, the modelling of the reliefs, and the painting, whether these eousist of figures, flowers, or simply of ornamental forms,
—are of rare and felicitous excellence in many cases, and
of high merit to all. The fluished perfection of these choice works must have exercised a great iofluence on the other manufactures of the country, not only by forming a band of worktnen educated to perceive excellence as well as to produce it, and capable of giving assistance in many other brauches of mannfacture, but by their effect on the general cultivation of the public taste. Nor do such establishments benefit the country that supports them alone, they diffuse taste abroad, even into other lands. Thus the improvement of our own general mann-facture of china has already been adverted to, and yet it is but justice to say that it owes much to the lab of the national establishments both of Sevres and Dresden; not only that their works have in some cases served as our examples, or guided our manufacturers by the principles of their decorative treatments, but from the stimulus to improvement which has resulted from the contemplation of rare works, and of that perfection which arises from a manufacture occupying itself rather upon efforts of skill than upon general production, and shie to employ itself upon them irrespective of expense and regardless of cost.

Yet the danger of producing mere oreaments is fully illustrated even in china ware; more particularly in the works of the Royal Daesben Manufactor (3 Zollverein, 174, p. 1112), since, as far as is shown in this Exhibition, the porcelsin manufactured therein would seem never to have got beyond this result. The works have none of that purity of form which almost of necessity arises out of constructive utility; the reliefs, governed solely by the imitation of untural objects, and nut by the requirements of use or the rules of art, are quite unsuited to the material; and the colour has none of that indicious sobordination to the effect of the whole which is seen in many of the productions from Sovres. The surface is often covered with purely imitative flowers in high relief, glowing and brilliant as the tints of nature, yet looking gandy as ornament, and, from their filmy projections, liable to injory with every touch, and their preservation a source of constant anxiety to the possessor. Even the May-flower pattern,-a production of great beauty, on the principle of a dinper of form and colour,-from its minute hollows, is quite incapable of being cleansed, and from the thickness which it adds to the form, contradicts the true effect of porcelain, which should onite lightness with capacity. Imitation seems to rule, and not orna-mentation. It may be, and no doubt is, difficult to form a tree with all its flowers and foliage out of porcelain, but nothing is arrived at when this is effected; it certainly has no utility, it is not oronment, and the more truly imitative it is rendered, the less it would be regarded, unless our attention was specially called to it as a wonderfully

difficult effort of Inbour. Altogether, a rococo air pervades the porcelain from Dresden, partly resulting from the style which was in vogne when the maonfacture was at its senith there, and largely from the production of works merely oronneutal. from which it obtained so large a share of its celebrity. It still clings to the contorted constructive forms and extravagant prettiness of the style of Louis XV., which have been almost entirely laid aside in the establishment

Among the most beautiful works to the Sevres Court are the elegant tazzas, covered with moresone organient in green and gold, and in blue and gold, on the natural white ground of the material. The two vases in unglazed bisque, decorated with figure subjects, painted by M. Roussell, after the designs of M. Amory Duval, are submed, so as to harmonize with the delicary of the form of the vases. The Labour Vase, by M. Klagmann, sculptor, is a good example of figures in relief as oranment, so applied as not to interfere with the general lines of the form. It is a vase of large size, in white bisque, very attistically designed and modelled, and is an evidence of many difficulties of manufacture, arising from its size, skitfully overcome. A casket, enamelled with white figures on a blue ground, the work of M. Haman, is also an example of great heauty. When we consider the choice paintings on poreclain and in cuantel executed at Sevres, not only from the old masters and others, but original works also, we shall be sensible of the great impression they must produce on the workmen, and the femulous efforts of manufacturing skill they must call forth. The figure paintings of Duelnsean, Thurgot, Beranger, Laurent, and others, with the flower-pieces of Jacobber, Schildt, &c., must be allowed to have exerted this influence in a high degree. In our own country wo have skilful enamellers, as may be seco in the exhibition of such works in the Fine Art Court; but those artists are not connected with the potteries, nor employed by the manufacturers; in fact, their art is too costly for such uses, nuless where, as io France, a nation pays for that

which is of great value for a nation's improvement.

The skilled French artists who have been enumerated are the successors of a line of others, who, for nearly a century, have laboured to improve the manufacture of porcelain, sided by a hand of workmen trained in the same school, to assist them in their efforts-with what eminent success has been sufficiently shown. In England onr china painters are oot artists, and but few of them seem to have artists' feelings, nor until of late years have they had opportunity of gaining the necessary instruc-tion. The painters on china copy fruit, foliage, and flowers well; but when such labours are original, they too often consist of but slight variations of some stock and stereotyped forms and colours, which the workman uses over and over again, without novelty either io grouping over and over again, without noted the property of drawing. In the power of painting the human figure they are mustly deficient, and few of them are able to execute subjects of which fieth forms a part. The modellers also have been sadly deficient in knowledge of the figure and of its annomical details. In both these particulars, however, they are slowly improving, and the introduction of pariso and other materials for statuettes, which is beginning to form a large branch of business in the potteries, and which, as yet, is nearly peculiar to England, has been of service in showing them their defects, and in urging them to amend them. The Schools of Design established in the potteries, in which some of the principal manufacturers take an earnest interest, have already, produced some results, and energetically supported, will no doubt he of essential value to the workprotect, whi so donot be of essential value to the work-man and to the manufacturer. This is abundantly evi-dent in the statuettes exhibited by Messrs. Copplaxon (Class XXV, 2, pp. 713, 714), and Mr. MINTON, (Class XXV, 1, pp. 709-711), as well as many other British maunfacturers. These statuettes, often reductions from the works of emineut sculptors, are completed far more successfully than would have been possible a few years ago: and when we consider the difficulty of putting them together by properly and skilfully adjusting the parts after they come forth from the moulds, and the farther care required from their extreme shrinking in the firing, many of them may be regarded as highly successful results. Still there is room for improvement; the countertion, in the details of the joints, features, and extremities, is not quito equal to some of the bisque figures that here

been produced at Fevres; and it is yet a desideratum (which may, however, arise from the spread of statusty

porcelain) to unite in one person the urtist and the work-nan, as in the case of the hemistist of France, as well as many of the foreign workers in the previous metals.

The Royal Manufactories of Berlin and Bavaria have avoided many errors prevalent in the china-ware of Dresden, and have rather followed classic models. The works exhibited, however, are deficient in originality; the vases are of the most common classic forms-over louded with orunment, and having landscapes and pictures painted in compartments on their surface. Dresden enamel-painters on china rank next to of France; and BUCHER (3 Zolly., 176, p. 1112), and WAL-THER (3 Zolly., 177, p. 1112), in their copies of paintings by the old maters, evince a perfect knowledge of their nrt. Tarrexa, in Russia (318, p. 1376), mod Nico, in Austria (615, p. 1038), exhibit skilful enamels on china; hut the porcelain from these constries has no peculiar originality or excellence to recommend it.

In ennsidering the question of design, as applied to that division of pottery and porcelain which more espe-cially comprises works of utility, constructive form should have the first attention; and in such works as are intended for vessels of capacity those forms should be adopted which, while they are most elegant, are hest fitted for containing or holding. Such articles, moreover, being of continuous use, the power of ready eleansing is of great importance, and should have due attention from the designer. It is to be remembered, also, that the means of receiving that which is to be contained is us necessary us its ready ont-pooring; since it is hardly desirable to have to upply a funnel to fill a pitcher or jug intended for constant use, although this may be permitted in a bottle, which is required to keep its contents cool, or to be carried about, and subject to spill them by jolting, and therefore needing a smaller aperture. Moreover, a jng, or pitcher, which will admit the hand to cleanse it thoroughly, must be more suited to daily use than one which will not. A due consideration of utility would regulate the form in many other cases; as, for instance, in caps and other drinking vessels, it might be most graceful to curve the top edge outward, but since such a form is likely to overflow the person in drinking, however superior in elegance, it should not be adopted. When utility is considered before ornament, namerous truths of the like kind will be arrived at, which are entirely overlooked when the order is reversed; thus relief, when used, should be extremely low, and without indented hollows in the composition, as well as without underentings, in order to give facility for cleansing; but while this is required for utility, it is necessary for elegance and beauty also; the Greeks were fully nware of it as an important truth, and in their pottery abstained from reliefs, or kept them to the lowest impost: the vases of Etruria have generally their line unbroken by the ornament, and the reliefs on the celebrated Portland vase are so extremely low as entirely to preserve its outline. In the same spirit our great Flaxman worked to improve this more, as seen in the examples exhibited by Messrs, Wedgwood; Eastern nations are sensible of the same truth, and their vase, such as is shown in figure 1, adopted as a pitcher:

(p. 1419), and here engraved, will illustrate this, as

well as the fitness of form to use. The neck narrow at the bottom, whereby the stalks would be compressed and supported; the cularged balb, to contain sufficient water for their nourishment, and at the same time to serve as a boss for the hand to grasp, is of a piece with the proper consideration of the decoration, This is not painted, but is of the nature of an inlay, being clossome enamelled over the whole surface; that is, the enamel colours are filled into a coffer of metal standing on edge around the ornumental forms, the line of the tuse being carefully preserved.

The application of handles is another important point connected with constructive design. The ensiest and most convenient means of lifting the weight, when lifting only is required, and of lifting and pouring when both mre requisite, being the question to be determined. often this is arrived at more by chance than by calculation. We see, for instance, the form of an Etruscan

the original having two handles, formed for its occasional | for one of the handles; perhaps it is to serve as a ewer, removal unly; for its new purpose, a spont is substituted requiring raising and reversing at every effort to pour,

and yet, so changed, it is acted upon by the hand and wrist at the greatest possible disadvantage, the haud having to lift the weight, as it were, at the end of a long lever, and reverse it by the power of the wrist, as is shown at a (fig. 2), while a much less power applied at b shown at a (ng. 2), while a much less power applied at o (figs. 2 and 3) would suffice to reverse the pitcher and pour forth the fluid. The height of the handle is of less importance when the contents have to be delivered from near the bottom, as in the Eastern form at fig. 4; since the slightest tilt of the vessel would begin to empty the contents through the spout, which would not be the case if they had to be discharged from the top. These hints will serve to show how important the proper consi-deration of the insertion of the handles is in such works, and how errors arise from merely adopting inconsider-ately a form fitted for one use for another purpose. It would carry the subject too far to increase examples, but these suggestions followed out would lead to multiplied instances of false adaptation, and may serve to induce a instances of name muspitarrow, and any more careful consideration of the subject. In the application of colour to porcelain and earthenware, the sur cation of colors to percensus most carrier water, we wanted never should be wholly, or indeed largely covered; the material has a purity that should be decorated, not ob-scured. A due consideration of this simple rule would condemn a vast amount of bad taste, such as completely metallizing the surface of china by gilding, changing chins into imitative marble, or covering the field of mar utensils with pictures, landscapes, or flowers. The Greeks decorated their pottery in bands, introduced to mark the change of curve, or to separate the various surfaces: the castern pottery is in the same way decorated in bands, or where the surface in more covered, it is merely with a diaper, which leaves the material sufficiently visible.

displet, which reaves the material sinusciently visions. Landscapes and plettores are almost always out of place in pottery, and it certainly is objectionable to cover the securior of places and dishos with plettors and view; not said it is desirable to reation, but because utility would be better served by the alsence of any decoration in the part which receives the vision, to said it is desirable to reation, but because utility would be better served by the alsence of any decoration in the part which receives the vision, to said yit at sense of eleminess only to be obtained by the white unchanged surface.

of the material.

the surveyer is deviced in many terms in his shelfing of the survey of

When, however, dne allowance has been made for finits, failures, and short-comings, it is impossible not to

feel that the general mannfacture of china has made great progress in this country. There is a greater selec-tion of pure forms—a less gaudy treatment of the whole surface-than heretofore; and where works are founded on past styles, their most meritorious qualities are selected, their faults rather avoided, whilst the power of the art-workman has visibly increased. Thus, in the cautiful dessert-service from the manufactory of Mr. MINTON (Class XXV., 1, p. 709), whilst there is much that is derived from old Sevres patterns, it has been, hy judicious adoption, rather than imitation. If the figures are a little crowded, they will be found exceedingly well modelied; and the purity of their white material, con-trasted with the delicate hues of the colours combined with it, has a chaste effect, the furthest possible removed from gaudiness. Indeed, the great merit of the works from this maunfactory is the restrained use of colour, and the general delicacy of the decoration. Some of the small figures on the centres of the plates are excellent specimens of the china-pointer's art, and there is almost a total abstinence from landscape, or mere pictorial sub-jects, on these utensils. As to the imitative renderings of flowers on china, it is hard in this case to object to their want of conformity to principle, since the beauty and purity of the surface of china is so suitable to such art purity of the surrace of china is so issurante to silen aff-that here, if anywhere, their use may be overlooked. The porcelain both of Messrs. Corza, and and Messas, Rosz, (p. 711, and Casas XXV., 47, p. 277), holds a high place also for form and colour; and some of the most accessful or the larger efforts at enumel-painting on china in England are exhibited by the artists in the employ of these manufacturers, as well as some excellentlyfinished statuettes. The application of porcelain to decorate the jambs of fire-grates has produced some well-designed slabs from both Messra, Coreland and Messrs, Minton; although, perhaps, one of the best designed of such works, with certainly some of the best English flesh-painting, is to be found in some jambs attached to a grate exhibited by Mesers. STUART and SMITH (Class XXII., 102, p. 603). An application of the design of some jewelled embroidery from the work of Mr. C. J. RICHARDSON, to ornament a flask, exhibited by Mesers. Corzzann (p. 712), gives a rich treatment, although contrary to the sounprinciple of not covering up the surface of the material too entirely; but in another specimen exhibited the whole merit of the adoption has been lost hy introducing a land-scape amid the lines of the form, making it appear how much chance and how little principle has governed the choice. One or two plates in Mr. Copeland's collection have great merit in their design, the width of the orna-mental margin being well considered and the centres judiciously plain.

and here see his enjoyments, glass bolds a promisers. It we great the mean oranneste. But will the promisering the III will be a possible of its warmen to be received in connected has been former the properties of the properti

For the purpose and utamia above extracted, the quitter surfaced to, its properly underected and duly condition surfaced to, its properly underected and duly condition surfaced to, its properly underected and duly which should geven to design and deceration. Of these, the formest are the similarity of arrival and its transfer to may these qualities are not only often directions and the same of the s

glames. The street is a significant of the street of the s

through the elever artists attached to royal manufactories, has arrived at great beauty and rare excellence, reflecting back an improved taste on the design and decoration of the general manufacture, glass has not been favoured with such advantages; and the specimens of Bohemian and Hungarian glass in various parts of the Exhibition, notwithstanding the rare beauty of the materials of the manufacture, can hardly be instanced fur the merit of their design. The mode of manufacture, by casting in clumsy masses in wood or metal moulds, and reducing by cutting with the wheel, is courrasy to the best qual of glass, which consist of lightness and elegance. aloue causes many of the faults of the manufact since the true characteristics of glass are lost, and are replaced by qualities too apt to degenerate into the mere-tricious and the gaudy. Thus transparency is merged in rich colour, and this, again, overlaid with gilding; or the surface is finshed with opal, cut away by grinding to the coloured under-surface; sometimes giving the appearance of porcelain, sometimes even that of the inferior penintee of poercian, sometimes even that of the intercent maoufacture, papier mache; whilst, occasionally, the whole surface is frosted by grinding, and tinted in crude colours, the appearance of glass being entirely lost, and only its worst quality, that of brittleness, remaining: whilst the forms adopted are often as inelegant and rude as they are unsuited to the material to which they are applied. The tall chandeliers exhibited among Count Harrach's glass are examples of these remarks; at first Harrach's glass are examples of these remarks; at first sight they resumble papier muche, from the excess of gliding on the dark ruby glass; and when examination determines them to be glass; the deeply-indented hori-zontal throatings of the mouldings of the shafts give a seese of dangerous insecurity and ill-adapted construc-tion. This is far less seen in the smaller works of the same kind, but it is, nevertheless, the natural result of wrong application of constructive forms to the material, and of an improper over-decoration of the surface: whilst it would appear that the true adaptation of such glass for the above purposes has not yet been obtained, its use in the above purposes has not yet been obtained, its use in the manufacture of immp pillars, knobs, and handles, lock furniture, and finger plates, has been more successful, and seems likely to be attended with more tasteful

When glass is used for large objects, such as chandeliers and candelbra, where construction is required, its known hirtideness is rather at variance with the construction produced to the material, and it seems in the principal branches and supports to require not only a hidden metallic structure, but even the appearance of it to the eye, to overcome a certain sense of insecurity. It uppight standing candelbras the work should arise

out of some other material as a bace, and it is executingly deptenable to be an gloss reporterior on the same objectionable to be an gloss reporterior on the same objectionable to be an gloss reporterior on the same states of first. In hasping chandlelers a construction outline of first. In hasping chandlelers a construction outline of the control of gloss and the cont

effect. In referring to the exhibited works in the manufactured material, the first place is due to the glass fountain of Messar, Osara (Class XXIV, 20, p. 700.) It is a matter of regret that a production so unique in this material should not be entitled to praise for its design; the truth is, that, works of the like magnitude in glass were having been before attempted, and the designer

being consequently thrown on his own resources, he should have seized the opportunity so offered, and, striving to forget what had been done in other departments, treated the material for itself alone, and con-sistently with its own proper requirements. Instead of this there is an attempt to mix architectural stone forms with others that have become almost conventional in glass, and the result is inconsistent and musatisfactory. The glass pillurs are far too slight for the heavy inverted canopy, and both those campies are too large for the lusius above, very inharmonious in their contrast of lines, and unfitted for the agreeable display of the water; the glitter of the iewel-formed ornaments with which they are covered being confused with the motion over them of the natural element, instead of serving to show out its brillinney and elearness; indeed, it is evident that the main source of error has been in supposing glass, and especially cut glass, a suitable material for a fountain; it is at once seen that this is not the case; instead of its being a proper foil for the sparkling water, glass emulates its sparkle and lustre, and the result is a failure from want of contrast,

The unsuitableness of glass, when on a large scale, for self-construction is also seen in this work, and is partly felt in the large and otherwise elegant candelabra ex hibited by Mesors. Osler (ut supra), the property of fler Majesty, especially in the horizontal indentations of the architectural moulding of the bases, which induce a sense of liability to break arising from the known brittleuess of the material, as has been before alluded to in the works from Bohemia; in other respects they are in good proportion and beautiful in material, and the gilt bases on which they stand supply the want of a metal foundation before remarked on; the colourless quality of the glass is extremely beautiful. It is hardly possible to estimate properly the effect of ent glass except under the influence of the light for which it is adapted, an influence which has been noticed even in the case of metal chandeliers. and which would be much more marked in its effects on the prismatic forms of glass; but loose pendant pieces the prismate forms or grass; not toose pendant preces attach together in long sweeping lines are well adapted for this purpose; and the general forms of such works as exhibited by Messro Ossian (p. 700), Messra Apsiar. Pellar and Co. (Class XXIV., 33, pp. 701, 705), by Prinut and Co. (Class XXIV., 36, p. 703), and others, are good, nithough they do not satisfy the mind as tu It has been necessary to diverge a little from the classifi-cation at the bead of this section to take notice of the above works and others of the like character : in returning to the objects more especially included in this part of the Report, the table glass exhibited by Mr. J. G. Garen (Class XXIV., 32, p. 701), deserves especial notice, both from the general excellence of the forms, and from his large adherence to those principles which have been considered as best regulating the true use of this beautiful material. In his blown-glass jugs, water-bottles, and wine glasses, some of the purest forms derived from Greek uteusils have been selected and adapted to the material and to present use; they are decorated with ground ornamental forms in bands, and although the ground ornamental forms in bands, and although the ornament is sometimes too redundant and alsepred, it is in the right direction. Many of the forms exhibited by Measer, Parlatar, and by Meeser, Riertansoos of Stont-laridge, have great merit, while the beautiful applications of glass to door-handles, and the extreme partity of the material obtained by Meeser, Pellat, of the fire view is all plit ornamental elurater in such works. Meeser. M. HARRIS and Soxs (21, p. 700) have some finger-plates in glass that point out a beautiful use of the material; one with a diaper in silver on a blue ground is chaste in effect and clever in its design. P. J. Lanocue, of Paris (1287, p. 1238), exhibits some goblets and glasses of pure blown forms, simply ornamented and in good taste; but on the whole the best white glass, both in form and ornamenta-tion, is to be found on the English side.

injury than improve public taste from over decoration. The richness of the material, from the hrilliant colours that may be produced in it, renders it liable to this fault, which is greatly increased by the gaudy extreme to which the ornamcutation is carried, too often applied to coarse, unrefined, and inelegant furms,

WORKS IN THE PRECIOUS METALS.

The design and ornamentation of works wrought in the precious metals deserve especial attention in this Report, since in this department we may expect to find the highest art applied to the richest and most costly materials. Moreover, in such manufactures more than in seem to concur, and are aften so intermixed that it is difficult to designate their several provinces, or to determine where art ornament diverge from one another. Here we have a field wherein we may study the right application of each, and understand the due limit within which each is available for the purposes of manufac-

However, in the highest range of his art, the orna-mentist may be merged in the artist, there is a distinct difference in the principles of the two arts, a difference which becomes more apparent as the oranmentist descends from labours of such high requirement to those more strictly within bis own province. Art has its childhood in a careful imitation of nature, and grows into an ab-stract initation, or generalization uf nature's highest beauties and rarest excellences—still, however, initiatively rendered- and nature, thus selected, becomes the vehicle for impressing men with the thoughts, the pas sions, and the feelings which fill the imaginative mind of the artist. The generalized imitation of nature is the language in which these imaginative abstractions are embolied and expressed, and this whether the artist be seulptor or painter; the landscape painter even proceeds on the same principles, and cudenvours by a selected on the same principles, and cudenvoirs by a selection initiation to reproduce the aspects of nature in harmony with certain feelings which fill his mind, and which he wishes to impress on the mind of others. In its lower phases art relies more and more on imitation, seeking to give pleasure only by the reproduction of beautiful objects or beautiful combinations, until, in its lowest development, art, if it can be so called, rests contented with mere imitation,

In considering in a like manner the scope of the oracmentist, it will be evident that in his highest aims he is assimilated to the artist, so that it becomes extremely difficult, may impossible, to separate them, or draw may line of distinction between the one and the other. Thus the beautiful shield which embodies the description given hy Houser of that of Achilles, designed by Flaxman, and exhibited in electrotype in the Fine Arts Court (365, p. 843), and that skilful specimen of embossed work, the shield by Autoine Vechte, in the collection of Messrs.
Hunt and Roskill (Class XXIII., 97, p. 686), are at one
and the same time works of art and works uf ornament, From this high range the occupation of the ornameutist descends by imperceptible degrees; not as in the case of the artist through the more and more close imitation of nature, but by selecting from her whatever is beautiful and graceful, irrespective of her individual embodiment of these qualities, and adapting them to give pleasure separately and apart even from any wish to recal the objects themselves from which he has sought or obtained them; his effort is to give the most characteristic embodiment of those natural objects (viewed in relation to some peculiar quality, form, or eclour, or some particular adaptation required), rather than to imitate; indeed he departs more and more from instation as he diverges from the path of the artist to occupy his own separate province as an ornamentist. These are truths to be continually borne in mind, as they constitute the only cure for that false style of ornament so largely pervading the manufac-The design of the Bohenian glass, both of Corvx; Vos Ilanascu, (687, pp. 1068, 1097), the largest exhi-bitor, as well as of Messrs Kotta, of Pergue, and of other anomafactures, Foreign and English, is tending rather to which is nowhere more largely exhibited than in works

in the precious metals, and in the affiliated manufacture of plated and Shetlield wares.

While it is not possible, therefore, in works in the precious metals, entirely to separate the artist from the ornamentist, still for the purposes of description their separation is marked with sufficient distinctness. A great cause of the faults exhibited in these works seems to be, that they have received their design rather from the artist than the ornamentist; thus we have figures having no constructive connexion with the work ornamented, but rather of the nature of statuettes perched wherever a ledge or shelf offers accommodation for them; these are generally as imitationly treated as the material used and the powers of the artist permit, and are applied to inkstands, eaudelabra and works of the like kind requiring a purely orsensedal consideration. Many centre-pieces, racing-cops, and testimonials are treased merely as groups would be by the sculptor, although the lowest style of his art has but too frequently been adopted, and imitations of textures, chain and plate mail, and such laborious littlenesses, made a point of, rather than that nobler view of art, which, discarding miniature and strictly initative details, seeks by grandeur of form and largeness of manner, to make us furget the scale of the work in the dignified style of its treatment. Now, if it is proper that these wurks should be consigned to the hands of the artist, he is bound to treat them according to the laws of his own art, not only by a noble style, but also by making them as groups truly statuesque, combining the parts so that they form an agreeable whole in all possible directions of view. Above all, the thoughts which, as works of art, they serve to embody, should be such as are worthy of being illustrated on metals of great value, which enriched by true art are enhanced in worth a hundredfold,

If we contemplate some of the inventions of the artists, and some of the thoughts which they have wrought out we shall be indeed surprised that such puerifities could be dwelt on long enough to execute them as wurks of art, and still more that mannfacturers, so shrewd as they generally are, should be found to engage in their production, were it not sufficiently evident that there is a large and wealthy public whose taste does not rise above such art, proved by its becoming patrons and purchasers. What can justify the employment of the precions metals, and what ought to be the more precious labours of artists. upon huntemen and ploughboys, to render them with all the coarseness of their garments and the texture of their hose? or who, but the givers of a testimonial, relying on the known taste of its receiver, would require art to be degraded into the mere imitation of a hedge-row occurrence on a hunting-day when the sport was successful; knee-breeches and top-boots being as important items in the groups as the hounds, horses, and the portraits of the individuals whose good fellowship it commemorates? It is such art in the more precious metals, employed on such thoughts, that leads, in the imitative manufactures, to the many paltry inventions which are found to prevnil therein. Rachel at a well in a rock under an prevail therein. maches at a water, but ink: Burns imitative palm-tree draws - not water, but ink: Burns shepherdess would find the same black fluid in the formless well by her side; a grotto of oyster-shells with ebildren beside it, contains, out n light, but an ink-vessel; the milk-pail on a maideu's head contains, not goat's milk, as the animal by her side would lead you to suphut a taper. Sueb works are akin to épergnes with the bippopotamus and his keeper; or Paul and Virginia under a palm-tree that upholds the glass for flowers on or Apollo dancing, supporting at the same time n glass épergne twice his own size; and inventions of equal or greater accelty wrought out with great waste of skill and labour. Even when we arrive at really artistic works in this style, of which happily there are many, it is more than doubtful whether the ornamentsis would not be more suitably employed upon them, and an ornameatal and architectural construction first obtained, ere art was called in to aid in their completion. It is not pleasant to add, that the above strictures more especially refer to English productions. It is true that such works bave often a local significance or an individual importances, consing their exhibition here, and making it less likely the materials of our dress by the threads of its mann-

such should be exhibited by the foreigner than plate of a specific use, or ornamental works whose characteristics are more general; but it is impossible to deuy that the tasto of the class who purchase or commission these works abroad must be higher than our own. In France, for instance, we find testimonials and prizes

taking the shape of art rather than of massive metal. The President of the Republic, in contributing a prize to the wioner of the Chantilly races, presents a shield, on which are four reliefs, illustrating racing in various ages of the world; and when the vertices of Montlucon and the inhabitants of Lot desire severally to present testimonials to Generals Changarnier and Cavaiguse, the weight of silver is of far less importance in their eyes than These works the rare beanty of the art-workmansbip. These works are exhibited by M. Froment-Menrice; and the two latter, two beantiful swords, are eboice examples of design and chasing. Moreover, it is worthy of notice that in such works the artist does not consider his vocation a separate one, but regards the utility while be perfects the art. In both the above sword-bits, the ornament (group of figures) has been so thoroughly adapted and composed for its purpose as a bandle, that it is perfectly accommodated to the grasp; which is the case also with a beautiful short sword, ornamented with the history of St. Hubert, executed by M. Marcet, and exhibited by MARKEL BROTHERS

(France, 331) in the same department When the amount of those works exhibited by the gold and silver smiths of Great Britain is regarded, an amount whose value is to be estimated by its weight in tow, it must be owned that there seems ample encouragement for more skilled labour; but the slightest glance will serve to show how largely the mere weight of metal enters into the estimate of value by the possessors of plate here; and, on the contrary, how little fine art is considered to add to its worth. And yet art would give a more real and permanent value than mere material, and tend at the same time to separate the precious metals from the plated substitutes which ape their richness, but which would never engage the hand of the artist in such rare and costly efforts of skill; indeed, it is a curious fact, observable in the imitative manufactures, more especially in those where the production is very easy, and the sale likely to be extended from the cheapness this induces, that, instead of being employed on art, of the best character, in the first type, it is often of the most wretched description, notwithstanding one might suppose that the cost of tho first model, even if high in itself, would be trifling dispersed over a multitude of copies; but it is probable that person over a mantitude to copies, out it is protosole that the style of the work in such cases is suitable to the general taste of the purchaser. Thus the electrotype process, by which means the travest specimens of art can be, and have been, reproduced, applied to general mann-facture, or where original works have been attempted, babeen too often used un the worst art and the most puerile ornament. The same is observable in works formed by stamping in dies, and even, though in a less degree, in those east in moulds, and afterwards chared; and it is only when the same man's mind invents the work which bis hand executes, that the highest skill is seen conjoined

with the most beantiful art. It must be owned, however, that our countrymen are greatly deficient in the treatment of the precious metals as the medium of art. The truth seems to be, that here one artist designs the work, and perhaps makes the mode., whilst another is employed to produce it in the metal. Thus we find works designed with great ability, and modelled with much knowledge, and evidently by artists of great professional excellence, yet these completed in the metal with every possible littleness of imitation, serving only to degrade and valgarise the art it is employed upon; and this frequently is caused by the surface treatment and the mode of execution, wherein imitation has taken the place of art. Thus the true artist does not produce the texture of the fur of anionals hair by hair, but gives its general expression by some conventional rendering, by the indications at the parts where the skin folds, or by tooling to emulate the lustre nf its gloss. In the same way true art does not imitate

factors, but indicates them rather by the shape and contact of the follage. It is the works under canamianton, the of the follage, it is in the works under canamianton, the development of the contract of the contract of the development of the contract of the contract of the development of the contract
Again, in the higher works in silver the foreign artists has had the bolishes to regard the nativelli, rob and sha had the bolishes to regard the nativelli, rob and sha had believed to regard the nativelli, and that hatter and brilliary, which is one of the present accretiones of the mere match, he shakes by acids are in-historial mere and the state of t

exhibit the art. Another defect of the works in the precious metals, as exhibited on the English side, may be traced to the sar cause-the separation of the work of the artist and the silver workman: hence casting and rhasing are the means of production here, whilst the foreign artist himself noes the hammer and the punch, and beats out with his own hand the creations of his foney or the inventions of his skill. Casting and chasing in their proper application are means only of producing and perfecting a thing, after the design and model have been executed: even in the hands of the artist himself they are but completing and perfecting rocesses; the work, as far as invention goes, is already done before it is enamitted to the mould; and the chaser does but perfect what the easter has produced, with the more or less excellence, according to the art-knowledge which he possesses; but by the embosing process, called reposses, the artist himself produces the work by punching the plate of silver on a soft matrix, and continually annealing it in the course of his labours. By this embossing process the mind of the artist is working with every stroke of the craftsman's hammer; and not only every stroke of the craftsmans hammer; and not only locs his own hand work out every characteristic quality of the surface, whether of flesh or of drapery, and bis knowledge supply every essential detail, but thoughts seem to arise out of the very method and means of working, and each stroke on the puneh may prove a suggestion leading to new faories, or be followed ont into more happy details. Even from the accidents of annealing-constantly necessary during the work-the colooring of the metal in the furnace calls op new thoughts, like those which arise in the mind of the poet watching the glowing embers, and the artist at once embodies his new-found fancies. Chasing has none of these suggestions; as before said, it only perfects: whilst embossing is to it what etching in the hands of the painter is to engraving. The very means in the one are suggestive in every stage of the progress; while the other is only a more or less complete copy of a previously-designed original. The beautiful and skilful works of Antoine Vechte, both thu shield before alluded to and the vase representing the y of the Titans (p. 686) whirb accompanies it, with the beautiful centrepiece wrought in ailver partly by the same process, the work of Wagner, exhibited at the antrance of the Court of the Zollverein, are rare specimens

of this mode of working, and its suggestiveness will be at once understood by those who are at the pains to exam sur b parts remaining as it were in the state of sketches, and speaking in this state so strongly to the inventive fancy of the artist, that he who looks into them feels a strong desire to work out the thoughts and fancies they cause to crowd upon him. The iron shields exhibited by LE PAGE MOU-TIER (France, 1364, p. 1241), are also fine examples. This mode of workmanship tends also to a unity between the ornaments and the objects ornamented, whilst chased work and east figures, too often necessarily wrought apart, and applied to the group or thing ornamented, have oftentimes a contrary tendency. In reviewing the question of works in the precious metals, there seems a coarseness and florid style pervading English works, showing itself in groups "in the round" io imitative art, in bold and overcharged relief, in coarse ornamentation, and in colarged scale; wiolst in France, the only other large exhibitor, and in the works of Wagner, in Germany, and of certain French artists on the English side, there is much less of this randiose rourseness, particularly in the art not specially devoted to purposes of manufacture. At the same time they bave, perhaps, in some cases rather too much ignored the consideration of the material, and treated it entirely as a medium for the art. This was not the case with tha medieval goldsmiths, or with those of the 16th century, who, whilst adding exquisiteart torich materials, so treated the general surface as to obtain at the same time the richness and lustre of the precious metals. One thing that we neglect, however, which our French neighbours do not, is the use of enamels; and the varied treatments of surface by axidizing, pareets-gilding, burnishing, niello, &r. The use of enamelling as an ornamental addition to the surface of the precious metals has been confined, with one or two exceptions, to chalices, patens, reliquaries, and other ecclesiastical goldsmiths' work, founded on ancient and medieval examples; and there are some good specimans of Champleve enamelling in the collection sent by Mr. Barman, (522, p. 761), as well as in the works of Kertu (Class XXIII., 121, p. 694), and Skitmore (Class XXIII., 23, p. 694), and in France in those exhibited by M. Poussikloue-Rusand (1405, p. 1243); but the most artistic examples of the use of enamelling are in the elegant monotings of rock crystals, agate, and lapis-laruli, as cups and fingons, by Mr. Monez (117, p. 693), of Burlington-street, which for felicitous design and beauty of execution, equal the rare examples of the 16th century. It is understood, however, that these are the works of a French artist. Mr. WEISHAUPT, of Hango (1 Zolly., 412, 1073), in the tastefully-designed chessboard which he exhibits, has also made an artistic use of surface enamelling, both in the dresses of the chessmen and the ornament of

centre, and serround the outcomes rins of the shield, not being continued travely the composition of the source temperature of the control of the control of the control centre of the control centre of the control of

the table; while the choicest specimen of the combination of many materials to form a rich and beautiful work is

seen in the shield of Faith, presented by His Majesty thn King of Prussia to his godson, the Prince of Wales; it was

designed by Cornellus and Stülzer (p. 110), and executed by Hossauer, Fischer, and Mertens; and is rich, without the slightest tendency to excess. The subjects, from the Scriptures, in silver, are ably excented in low relief, and carefully classed; the single figures of the Apostles heantifully designed, as are the accompanying enamels. Thu

ivory forms that frame in the compositions towards the

of flowers as ornament. An enamelled incense-burner of large size, and the flower-vase inserted in the remarks on pottery (p. 1645), both from China, and exhibited by Mr. Alcock (p. 1418), are beautiful and choice productions in this art

If we can allow such works as testimonials, racing-cups, centrepieces, and others of the like character, to be given up to the treatment of the artist, there is still a large number of other articles in the precious metals and their representatives having a defined purpose as utensils, and strictly devoted to a use, which must belong to the domain of the ornamental designer, and be subject to all the laws of his art. Of these, utility should be the first consideration. They should be composed on geometrical forms and have a symmetrical construction. Capacity and mobility, in most cases, will have to be regarded, in connexion with proper stability and solidity: and it should be remembered that, as domestic stessils, they are not to be placed under glass shades, and therefore will require constant cleansing and polishing, and that, not at the hands of the silversmith. hut of the hutler or his assistant. This alone ought greatly to regulate the treatment of surface, which should be such as will best display the beauties of the metal, and yet not render it liable to injury under such cleansing. Then again, it is usual to make the handles and knohs points of ornamentation, and this nut improperly; but it should nut be forgotten that they are to be grasped for lifting, and ahould be convenient for that purpose. And neither in these, nor, indeed, in any other part of the ornamentation, should the relief be so bold, or project so far, as to be liable to accident or entanglement in the use of the articles. Some of these remarks may seem almost appalled for, hut are not so: nor are the errors recited confined to English manufactures, but are equally evident in those of France. rance. Thus it is impossible to justify large and florid roups of dead game, of fish, of fishing utensils, or the groups of dead game, or man, or maning dish-covers, or like imitative treatments, as the knobs of dish-covers, or the handles of tureens; however beautiful in design or excellently chased, they are not convenient for use; nor can the hand be safely brought in contact with the metallic toes of a pheasant, the tentaculæ of a lobster, or the twigs of a fish-basket, any more than stags with their branched antiers can well be laid hold of to remove a venison dish. Faults of this class chiefly arise from the natural or imitative treatment, which has to answer for so large a

growth of arrors. It has before been remarked that the figures introduced into the ornament of metal-work are too often merely applied or atuck on, not arising out of the work as a constructed whole, and this more especially in those works which have been usually committed to the skill of the artist: but if not to be tolerated in those works, in objects of utility they are far more out of place, and comment requires that figures should have an ornamental construction. It cannot be too often repeated, that imitative trees and foliage, flowers that are like the growth of the hothouse electrotyped, and which dangle and skake with every movement, as much almost as would their prototypes on their natural stems, are not ornament, are in the worst possible taste for any useful porpose, and have a flimey and tinsel-like appearance, as much beneath the impressive effect in metal of even merplain surface, as they are wide of any pretensions to fitness or propriety as works in metal at all. This naturalism is evidently a heresy of the artist's, and should have no quarter at the hands of the ornamental designer. In the section devoted to hardware, the treatment of metallic surface has already been the subject of remark; much of which will apply here also; but in connexion with this imitative art, it may be remarked that the frosting, which it renders almost necessary for its display, is even more opposed to the hrilliancy of metal than that exidation so useful in showing art-treatment.

In jewellery, used for personal adorument, the fancy has full play, and the invention need be but slightly carbed hy a consideration of use, such works being in their very intention ornaments; where precious stones are employed, the first object being to display them to the greatest advantage, the designer should be careful that neither gold

a choice example of the art, but of the Indian treatment nor enamel interferes with them, and that there is sufficieut motion iu the parts to hring the light into play on their surface. In mourning ornaments, bracelets, hr &c., M. MECRICE has shown himself a skilful artist; her indeed, the fancy of the French art-workmen has full scope, and in such smaller works in metal as cane-heads, scal-handles, buttons, snuff-boxes, &c., the most delicate workmanship is found combined with artist-like design and pleasing inventions, both by this exhibitor and in the articles displayed by RUDOLPHI (France, 1465, p. 1946), GUETTON (France, 1619), and others. It only remains to remark upon some of the works for domestic use exhibited in this Class which have not already been spoken of or alluded to. One of the choicest works of utility is the tea-service of Eck and DURAND (France, 1211, p. 1235), which deserves attention for the architectural arrangement of the whole as an harmonious composition, and for the beauty and elegance of the individual forms and their ornamental details; it is a thorough study of ornamentation; the figures, where introduced, are perfeetly parts of the composition, and are oxidized to show the beautiful workmanship employed upon them; the ornament is in low relief over the surface generally, and purcels-gilding has been used to give expression where the treatment became confused by a little excess. The plateaus on which the cups, cream-vessels, &c., are arranged, are treated with ornament in niello, and every effort has been adopted to give variety to the surface without interfering with the general repose of the whole. Constructive use, moreover, has been well considered; the composition consists of a raised central urn, from which the water flows through several vents into four tespots arranged below, whilst chalices for sugar, eream-pots, &c., are grouped lower down in the arrangement, the bottom having spaces for the cups designated by circular groups of orasment in niello; the only difficulty is to conceive how so massive a piece of plate is to be filled at the top with hot water, and conveyed into the drawing-room, without discomposing its general arrangement; in addition to which, it certainly has the fault of being over ornamented, notwithstanding the great care that has been taken by low relief and otherwise to prevent such an ap-

The work on the English side which most nearly corresponds with the last-mentioned is the centrepiece, the property of His Royal Highness Prince Albert, exhihited by Mesers. Garrann (Class XXIII., 98, p. 689); this also has been designed with a proper sense of architectural arrangement, and is elegant in its general forms, especially the central tazza, while the low relief ornament on its surface is well considered and in good style; being entirely treated in gold, it has a tendency to monotony counteracted as far as possible by a very judicious use of burnished surface. The portraits of animals introduced, although very eleverly modelled, do not harmonize with the general treatment. This collection contains also some well-designed salt-cellars, vegetable-dishes, and candlesticks, whilst even some works in the florid and nearly discarded style of Louis XIV. look almost satisfactory, compared with testimonials and racing-cups of the character before alluded to, Messrs. Hunt and Roskell,'s (Class XXIII., 97, p. 686), principal centre ornament and plateau exhibits some cleverly-designed figures well modelled and with much appropriateness of subject, and it groups well as a composition. Many of the figures in the round, however, have too much the appearance of separate groups placed on the ornament and not forming part of it, a mode of treating such subjects which must be considered objectionable: this firm deserves great praise for exhibiting the shield and vase of M. A. Vechte, Messes. Elkinoton's (Class XXIII., 1, p. 672) application of electrotyping to the reproduction of art and ornament has been successful as showing its perfect adaptability to this perpose. The "hours clock-case." designed and modelled by Mr. John Bell (Class XXII., 641, p. 661), is a good example; it is an artist-like work of much fancy, and is a great improvement upon the worn-out commonplaces which the constant demand for such works ahroad has occasioned; it deserves notice as a work of art, but is wanting in the symmetrical and archi-3 5 2

tectural transgenest necessary to being it properly into the province of the communitation. The repetitions of the province of the communitation of the repetitions of p. 166; Mr. Catevaravo's reduction of Theores (184, p. 186; Mr. Catevaravo's reduction of Theores (184, p. 186; Mr. Catevaravo's reduction of Stewaravo's the Catevaravo's reduction of the communitation of the comlete, W. W. Prover Unitary Villago, 186; A. Catevaravo's the shield of Arbitish, have been preceded in most, and every summ of the communitation of the comlete of the communitation of the communitation of the state of the communitation of the communitation of the state of the communitation of the state of the communitation of the state of the communitation of the communitation of the communitation of the state of the communitation of the com

of past ages.

The beautiful art-workmanship, elegant forms, and the ornamental treatments of metal in the small chalices and dagger-handles exhibited by Manze. Haotenses (France, 331, p. 1193), should be alluded to, as well as the execution of the cup by Le Brun, exhibited by Eca and DURANA (p. 1235), since the art employed upon them is of the true character for such works; but it is not necessary to lengthen the Report by specially adverting to many other works which, while they contain much individual merit as efforts of skill, or even separately considered as efforts of art, are not consonant with the view herein taken of such labours; at the same time it must be remembered that many of the foregoing remarks are intended to apply to the views adopted in treating such works as test monials, racing-cups, &c., not to disparage the ability of the many talented and skilful artists who have laboured upon them, rather indeed to show that what is often expended on mere material ought to be apportioned to the labours of the artist, and that by the means employed to work out their inventions they are overlaid with littleness and spoilt in production. Iudeed, in England, the general impression resulting from an examination of the works in t'ie precious metals would be, that the endeavour of the manufacturer was to give the greatest quantity of metal with the smallest amount of art, which is not so observable on the Foreign side; the view intended to be promoted in this Report is, that art gives value to the metal, not the metal to art. A remarkable contrast in some respects to our own goldsmith's work is seen in the collection sent by the Honourable East India Company (p. 927), herein the least possible amount of metal is so treated by delicate hand-labour, by exquisite pierced work, enamelliags, and inlays, combined with such a thorough consideration of the trentment of surface hy huhl-work, &c., as to give the greatest amount of skilled workmanship with the smallest quantity of the material; and even in their commoner works (inlays and increstations of silver on iron) there is such a due consideration in the first place of beauty of form, and such varied and beautiful ornamental arrangemeats of the details, that they well deserve the consideratiun of the ornamentist

The Entert mations broply persiste the art of ladying both in metal and in other naturals, and discher weighten of war are described with indicate and, and and the strength of the strength of the strength of the strength of the party, they abound with commental shape, &c., when party they abound with commental shape, &c., when me with true projects. Thus, the tropy inlays of gas-to-the, priven in fig. 1, 2, 3, and of of plate 3, howe many the strength of the strength of the strength of an adopted from sature, and incomele were to their originate, any yet perfectly conventionalized, flat, and and characteristic in their form and colour, and not the critication of florent relationships and characteristic in their form and colour, and not the color of the strength of the strength of the strength of the color of the strength of the strength of the strength of the color of the strength of the strength of the strength of the color of the strength of

three coloured plates will prove. Almost all the urms exhibited are more or less ornamented, containing a store of suggestions most valuable to the manufacturer, and a rich mine of study to the ornamentist; among other qualities these works display is the Insteful distribution of the ornament, the sense of just quantity; it is rarely that a border contains too much or too little ornamental form, that a disper is too crowded or too vacant, too large or too small; a reference to the inlays of plat: 2, or to the textile fabries in plate 1, equally illustrates this truth, Nor is this excellent art applied only to costly goods; the same just principles are evident in the cheapest and tha becauer workboxes (of which a specimen is shown in figs. 2 and 3 of plate 3), a manufacture of the cheapest kind, show the taste and skill of the Indian workmen equally with the more costly cannelling of the dagger-case for various domestic and personal utensils, such as bookahs, flasks, bottles, tazzas, &c., are not only simple, beautiful, and correct in their appreciation of quantity but strictly ornamental, and abounding in suggestions of great value to those who will attentively study them: a single specimen, the inlay of a hookah, is given in fig. 5 of plate 2: the same principles, applied to a great variety of forms, are exhibited io many works in the Indian Court. There can be no doubt of the superior workmanship of some of the best European julayers, but in much of the ornament, and in all the true principles for its application, they had been forestalled by the natives of our Indian possessions, and by other Eastern workmen. The inlaid and incrusted arms of M. Le Page Moutiers (France, No. 1364, p. 1241), and M. ZULOAOA, of Madrid (Spain, 264a, p. 1346), are beautiful specimens of orna-ment and workmanship, while M. FALLOISE, of Liège (Belgium, 384, p. 1163), and M. ROUCOU (France, 1683, p. 1257), are successful exhibitors of inlaid work applied to other ornamental purposes. These inlays and incrustations are a means of most agreeably diversifying surface with ornamental tracery and beautiful lines with out interfering with the general forms of objects, and deserve more attention than has been given them by our

Works in plated nearth have been little allhoid to its day not of the Boyer, the it is no its remembered the day not of the Boyer, the it is no its remembered the same of the Boyer of the beautiful the same of
BOORBINGING.

The concluding subject of this section has reference to hookhinding, and the "design" applied to that hrauch of industry. In the Exhibition there is not a very large display under this head; but a few remarks are necessary to counteract a direction of such labours apparent even there, and much more largely seen in the general works of the time. This consists in overlooking the only true inteat of the art - the appropriate protection of literary works -- in order to make it a vehicle of such grady ornamentation and decorative display as shall serve to attract to their contents, the outside garb being a presamed niessure of the inner excellence, a practice not more degrading to art than it really is to literature. Such attempts induce the use of crude and harsh coluurs, and lead to excess in gilding, to heavy and coarse imitations of carved work in leather, gutta percha, and even less durable materials; to perspectives and pictures on covers, to improper and inconsistent applications of metal work, and numerous other objectional practices, which, as they do not tend to utility, and are opposed to the true spirit of the hinder's labours, must be avoided if the art is to attain to

up form last to Confession

· Coungle

the simple excellence of the medievalists or to the chaste richness of the binders of the sixteenth century. It is no doubt admissible, may desirable, that the omside decoration of a book should have some reference in its ornament to the inside contents; but still the details chosen should be amenable to ornamental trentment, should not be mere conceits, and, as has been so often reiterated, should not be mere reproductions of the ornament proper for a totally different material. Thus a painter's palette, with its range of tints prepared for study, let into the cover, can hardly be supposed the appropriate hinding for n work on colour, spart from the impossibility of any symmetrical arrangement of the object itself, or of the tints upon it, for its newly adopted purpose. Neither is the perspective deliueation of the apre of a cathedral a proper ornamentation for the cover of a "Church Service," any more than the host of treatments in the same direction, consisting of the fronts of cathedrals, oriel and rose windows, and stone tracery of mmy kinds, so often adopted for such purposes. In all tooled work and block impressions, bookbinding requires thaness of treatment as one of its first principles; interiors of churches, perspectives of tunnels, and even figures, pictorially used, are quite out of place. Heraldry and heraldic devices should be displayed flat, and even strap-work, or mere combinations of lines, should not be arranged so as to give the appearance of projection, any more than coloured materials or mosaics should give the appearance of relief, although the fine old Grober bindings and other works of the Renaissance period sometimes oftend against this rule. Another class of errors arise from mere imitation of details without full consideration of their intent and use. Thus, formerly, when the heavy Church Services were really bound in boards and richly ornsmented, hinges were a necessary appendage, as well as bosses, by their projection beyond the surface to protect any delicate carving, rich tooling, or rare metal work inlaid into the cover; and, at present, in books of constant use, of large size, which require great strength, and come under the same conditions, the use of these appendages is desirable and appropriate. But that which is proper for a copy of the Scriptures, or a Church Service, for the lectern, is hardly suitable for a book for the pocket; yet these miniature works are ornamented with hinges and bosses, sometimes really in metal, and sometimes only imitated as tooled work on the surface of the leather. Even in some works, where their introduction is appro-Even in some works, where their introduction is appro-priate, their intention is at times overlooked or dia-regarded; thus in a choice metallic binding of a book of "Ifours," by Madame Garca, France, 857, p. 1221), the figure of the Virgin Mary in the centre, whilst it has a higher relief than is suitable for a book-cover, projects. moreover beyond the impost of the decorative bosses at the

corners of lic cover, which ought to serve as its prosection, exhibited on the hoghlish side by Mr. D. Wyrest characteristics of the hoghlish side by Mr. D. Class XXVII, 34, p. 365; the works of the and on just principles as to flatness, are somewhat over-cowded and a first deficient in simplicity, which is made on the control of the

turvoire, and see at times wormy and meager in aprice.

| Second descript the beinging by Mr. P.M. Lower Firston, 'Interest to the property of
(Class XVII., 139, p. 544, has much merit, although wanting in a nice adaptation of the ornament to the corners. "The Glessary of Ecclesiastical Ornament" is also good, although the whole surface is too generally covered, and the nurgins too narrow for the size of the diaper. The cover of "Thomson's Sensons," by LEIGH-TON (p. 538), is one of the best designs of Luke Limner, and the washable enamel binding, in variegated colours, by J. S. Evans, (Class XVII., 8, p. 537), has merit in its npplication of colour if not in novelty of design. Messrs. De La Rue (Class XVII., 76, p. 543), in works of actual bookbinding, as well as in much that is allied to this branch of industry, exhibit some specimens of good design, the ormnment being composed of combinations of leatest symmetrically arranged on flowing lines of stems, showing how n principle duly carried out is sure to result in giving a novel and distinctive character to design. There is a harmonious unity about these works, but they are a little frigid and inclined to poverty, which out they are n little frigid and inclined to poverty, which does not, however, necessarily belong to the style adopted. Some finey papers, exhibited by this firm, are greatly to be praised; the ornament (in various styles) is most agreeably distributed, the forms flowing and elegant. and richness atmined without gaudiness. Some of these patterns would work well in silk or poplin, or even be suitable for printed fabrics; and it is in this manner that the design of one manufacturer, properly understood, may apply to another, where there are many qualities common to both, and no principle infringed in such adoption.

Dtv. 4.- Garment Fabrics.

Perhaps there is no subject which comes under review in this Report of more importunce than the consideration of design as applied to garment fibries, since the amount of skill and labour engaged in their production forms so large a part of the instancy of the world. Moreover the design applied to apparel must exercise a great influence over the general taste of the public, and persons who have been accustomed to consider gasdy, florid, and large ornament suitable for articles of clothing, will hardly be capable of judging correctly of what is true. beautiful, and appropriate, in the ornament of the domestic utensils and furniture of their dwellings. The great utensils and furniture of their dwellings. The great sources of error in designing for garment fabrics are over ornamentation, and attracting under attention to the ornament-which may arise from many causes; thus from the violence of contrast either of light and dark or from the violence or contrast enter or figure as one or of colour, from overcharging the colour, or from the ornament being too large for the fabric. All these causes, however, are modified by the material. Thus muslims and burges will bear more pronounced contrasts than the more solid or more absorbent textures of jac-quonet muslins or de-laines. Silks and de-laines, again, will hear greater fuluess of colour than the drier surface of cotton; while woven patterns in silk, formed by tabby and satin in a self colour, will bear much larger figures than are applicable to either waven patterns in varied colours, or the same printed on cottons or silks. Thus, the pattern inserted (G F, fig. 1)-half the size of the the pattern inserted (O r, ng. 17-mail the same of the original—is from a printed barege, and will give the largest scale of pattern which appears suitable for the open texture of this material; it would, however, even in the reduced size of the woodcut, he far too large for a Swiss cambric, although it might be even larger than the original size of the pattern on a self-coloured figured silk. These observations will show the nefigured silk. These observations will show the ne-cessity of the designer carefully attending to texture, lustre, &c., in preparing his design, and illustrate the difficulty of adopting without adapting the orna-ment of one fibric to the decoration of another. The flowing lines, agreeable distribution, and flat treat-ment of the details will illustrate other points in these remarks. See also the pattern of a de-laine (G F, fig. 2), and of a muslin (G F, fig. 4). Though the relative scale of the pattern, however, is a most important consideration, it is difficult, even after the above considerations, to

the pattern. Generally speaking, however, ornameot for such fabrics should consist of small, rather than of large forms-should be treated flatty, and without light and shade - and inclined to subdued contrasts of colour, and of light and dark. A geometrical rather than a dispersed a pranagement of the forms moreover would ht and dark. A geometrical rather than a arrangement of the forms moreover would dispersed be found the most agreeable to the eye, and the most consistent with sound principles, some of the best patterns being formed by dispering sprigs, leaves, flowers, or often even simple geometrical forms, regularly over the ground. That such patterns are essentially in good taste is shown by their constant reproduction for the more cultivated class of customers; whilst the sprawling trails and coarse imitative treatments brought out from year to year as the novelties of the season, pass away and are forgotten, or are thrust cheaply oo the market at o low cost, to catch persons whose taste is regulated by their pockets, rather than by their cul-To see the above principles carried out ated senses. fully and completely, it is necessary to call attention to the garment fabrics exhibited by the East India Company (p. 917): these are almost wholly designed on the principles here presumed to be just ones; the ornament is always flat and without shadow; natural flowers are oever used imitatively, or perspectively, but are conventionalized by being displayed flat and according to a symmetrical arbeing displayed flat and according to a symmetrical ar-rangement; and all other objects, even animals and hirds, when need as ornament, are reduced to their simplest flat forms. When colour is added, it is usually ren-dered by the simple local hue, often bordered with a darker shade of the colour to give it a clearce expression; but the shades of the flower are rarely introduced; the "cloth of gold figured in the loom" (fig. 3, plate 1), and part of an Indian scarf (fig. 2, plate 1), illustrate fully these remarks. The oranuent is geometrically nod symmetrically arranged, flat io simple tints, and bordered as above described, with darker shades of the local colour. The priociple of colour adopted is a balance of the complementaries red and green, in both cases with white introduced to give points of expression, and to lead the eye to the symmetrical arrangement of the ornament: io figure 3, purple is iotroduced to harmonize with the gold ground, a harmony very frequently used to the rich tissues of India; in fig. 2, variety has been obtained by introducing two reds, giving an ioterchange of a lighter tint in every other flower io the border. The borders of these searfs are beautifully illustrative of the simple and graceful flowing lines which characterize Indian ornament: and in fig. 2, we can observe the difference between the Eastern and the mediaval patterns; while the same principles are neknowledged in both, the

 By dispersed, is meant the attempt to distribute the pattern over the ground, without any apparent arrangement.

latter are often stiffer and more angular than the graceful sprigs of this border. Both these works show how much beauty may be obtained by simple means when regulated by just principles, and how perfectly unnecessary are the ltiplied thats by which modern designers think to give value to their works, but which increase the difficulties of production out of all proportion to any effect resulting from them, may, often even to the absolute disadvantage of the fabric. If we look at the details of the Indian patterns we shall be surprised at their extreme simplicity, and be led to wonder at their rich and satisfactory effect; it will soon he evident, however, that their beauty results entirely from adherence to the principles above described. The parts themselves are often poor, ill-drawn, and commooplace, yet, from the knowledge of the designer, due attention to the just ornamentation of the fahrie, and the refined delicacy evident in the selection of ground wand the choice of tints, both for the ground, where gold is not used as a ground, and for the ornamental forms, the fabrics, individually, and as a whole, are a lesson to our designers and manufacturers given by those from whom we least expected it. Moreover, in the adaptation of all these qualities of design to the fabrics for which they are iotended, there is an entire appreciation of the effects to be produced by the texture and foldings of the tissue when to use as an article of dress, insomuch that oo draught of the design can be made to any way to show the full beauty of the maoufactured article, since this is only called out by the motion and folding of the fabrin itself. An expression of admiration toward of the fabric uself. An expression of admiration for these mainfectures must be called forth from every one who examines them, and is justly due to merita which are wholly derived from the trae prioriptes which these goods have been ornamented, and which result from perfect consistency in the designer.

Lot revende to the green'd pseudoo of design for games (below). It may be remarked that the making up of such goods for use should have due countermion in the general direction of the pattern. Thus, while "up and down" restaments in stripes and trails are just to be included to the constitution of the pattern darks, consist the person, the pattern quarter with all the motions of the human figure, as well as with the form of the long folds in the skirts of the gamestic from this reason, large and pronounced checkers for the pattern quarter from the reason, large and pronounced checkers (see with distances), are offerented of any materials at drapers,

the graceful arrangement of any material as despecy, the designing for gramment finites, it will generally be food that the simplest patterns are in the best taste. The efforts, however, boils of designers and manufacturers, have been too often directed to graceful relationship to the comparison of colours in warning, or the combine or can be required to produce a warning, or the combine of can for required to produce a combine of can be required to produce a

certain design, devil upon, rather than the excellence of marticle, if reports an important production, rather than beautiful simplicity at small cent. As simplicity as marticle, if reports are for the rose beautiful, and that comprising, or verying in one colour, is in seed tone, that simple patterns are far the rome beautiful, and that one printing, or verying in one colour, is in seed tone, more of the simple patterns of the simple colour and production of the simple colour and the simple colour designating for patterns finites, there seed, in the larger moves of the draw, a serie of what a planter critinose of the draw, a serie of what a planter critiplicity, by flat or disported neutrinous of small forms, by planting the simple colour plant of the simple critical field against the above reporterment, and to case the officed against the above reporterment, and to case the

In examining the designs for garment fabries, both British and Foreign-many of them of great merit-two things immediately strike the observer, namely, that while there is great evidence of the interchange of ideas between European designers and manofacturers (the same Detweet Entropean uresquers and manuscrite.

patterns or modifications of them being seen oo both sides of the Boilding), it is impossible to fix on soy general principle or principles that have eireumscribed the efforts or regolated the taste of Eoropean designers as a body, or of any one of them as an individual. Thus we have the same artist exhibiting patterns consisting uf natural imitations—patterns founded on symmetrical and metrical arrangements-flat and shaded treatments trails dispersed over the sorface-nr sprigs dispering the ground-minotely small or coarsely large forms-indeed, showing his abilities indiscriminately without any apparent preference, io any and all styles and in manners most opposite. The case is entirely different in tha Indian Jubrics exhibited (for there are no designs), whether carpets, embroidery, or for garments; three or four leading and governing principles being prominent in all soch works. These appear the resolt of science, the other of chance; and it is singular, in this age of desire for unvelty, that oo manufacturer or designer has thought of seeking excellence or singularity, and therefore celebrity, by a rigid adherence to some fixed rules of design; seeking beauty of form and arranging colour in eou pliance with their dictates, and repudiating that off-hand lawlessness which is the oniversal practice. In view of this general dereliction, this equal indifference in prin-ciple, it becomes desirable to examine the causes of failure, and to endeavour to impress the value of the principles which have been neglected, rather than to offer especial remarks opon the designs exhibited in this section, and since, without the insertion of many illos-trations, it would be impossible to advert to the fabrica themselves, to consider designs and ornameoted fabrics at the same time.

In the section on the provious metals it has been stude to the section of the provious metals of the section of fine art, and it is now described to give another disfine art, and it is now described to give another dismarks to the section of the geometry, not necessary as a principle of art, is essentially and consists rather of unput in a section of the and consists rather of unput in a section of the contrast owner. Our another than the section of the contrast owner, Our another than the section of the contrast of the section of the contrast of the section of the contrast of the section of the

"repeats," for instance, besoing to the development of the space. In so soot disputed patterns, therefore, some amount of symmetry is produced by chance; thus the pattern (1.5 Ag. 2.1) has not been formed out on any open and the space of t

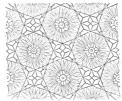

Mereover, if a repetition by means of blocks or cylinders, wholly without no symmetrical transportent is an imposned of the property of the property of the proains of nature not lightly to be broken through or disreganded; and should it not induce no to search for thisegometrical figures which give the best distributions of exgenment of the property of the property of the progress of the property of the property of the project. In fact, we ought not to altempt to overcome this law, but to accept it, and so regulate it as to give effect unatily, zero, and harmony of colors.

Having shown then that symmetry, regulated by geo-metrical forms, should govern the distribution of ornament, a little investigation would lead to the causes why certain symmetrical arrangements please more than others; thus the square of equal sides and equal angles (fig. 1) is the simplest and least varied basis of distribution, the most obvious regular figure, and at the same time the most inelegant and commuoplace; simply changing the direction of the lines, however, and placing the square lozenge-wise, as in fig. 2, gives a decided improvement; variety is partially joined to perfect symmetry, and a more pleasing arrangement of the forms and quantities is the result (fig. 2). Then again, if we not only change the direction of the governing lines, as in the last figure, but their angle also, as in fig. 3, and adopt the equinteral triangle and the lozenge which is its plural, we have a further variety, in the interchange between the apright and perpendicular spaces of the quantities, and the result is a still more elegant distribution arising from the mere variation of arrangement of the same simple details. Having arrived at these facts as a starting point, vis., that sym-metry is a necessary condition of repetition, and that symmetrical beauty is largely influenced by the angle or enhination of angles which govern it, we may pass from the right angle, and the angle of sixty degrees, which forms the equilateral triangle, to study arrangements under various other geometrical combinations, founded on other polygous and on ordinate lines from the various intersections of the sides of polygonal figures; such as hexagons, octagons, &c., of an equal number of sides; or

arrangements.

triangles, pentagons, &c., of an unequal number, de-veloping many beautiful symmetries and proportional a printed musliu, is founded on combinations of the octagon and its ordinate lines. As combining geometrical

forms with a thoroughly flat floral treatment it is very ingenious; the size of the pattern (one-half larger than the block) is very well considered for the texture of the fabrie, and it will serve to illustrate the subsequent remarks on quantity, as the pattern covers well without being crowded, is broad from the absence of harsh contrasts, whilst a sufficient amount of surface is left ancovered as required by this material. The colours, much wanted for the proper expression of the puttern, were delicately rendered in pink and green, and the design had a character of much elegance for a light fabrie such as muslin; it was exhibited by Florence Collins, among the works of the students of the Government School of Design

Geometry then is the basis of symmetry, leading the way to those arrangements which best govern the general distribution of form. If this view of the value of geometrical arrangement is correct as to the distribution of form, it is still more so as to colour; some colours require definite arrangements in juxtaposition with one another for harmony, and are governed by their own laws of relative quantity, having reference to their power of mutual neutralization, as three yellow, five red, and eight blue; such arrangements being more easily obtained and regulated on a geometrical buess, than on those dispersed patterns which arise out of repetitions of the accidents of growth, or natural imitations.

The subject next in importance is quantity, by which, in the decoration of garment fabrics, the taste of the designer is so largely made known. The due appreciation of quantity regulates the amount of the surface of the ground to be covered by the ornament, the interspaces between disposed forms, and the size of the ornamental details, especially in relation to the geometrical bases which govern the grouping; thus in the figs. 1, 2, and 3, the spots which are regulated by the ordinate lines might be larger or smaller, or, instead of them, the lozenges might be filled wholly or partially with orng-

ment, as in the design inserted (G F, fig. 4), the beauty and elegance of the design largely depending on the proper quantity admitted. Here the taste of the designer proper quantity admitted. Here the taste of the designer is exercised where rules help him no longer, but where he is guided by the considerations before mentioned as to textures of stuffs and qualities of surface, very important considerations which will be forther spoken of. A study of the Indiau tissues will show how well understood quantity as a source of excellence is in the East, their quantities being generally extremely suitable to the colour and texture of the material sought to he orun-

To recur to the subject of textures and surface as important considerations regulating design. It is too much the custom with designers to imagine that the patterns applicable to one quality of surface may be used judiscriminately for another, and that which is successful in one material, or by our process, must necessarily be a success in another; thus, no souner does a pattern in silk or worsted obtain the notice of the public than it is insmediately copied in printed cottons, without any regard to differences of material or modes of production, to the lustre and richness which belong to the former, and must be wanting in the latter. In adopting the patterns of the weaver, the progress by squares necessary to the weaving process is imutated in printing where it is switter suitable nor required; sometimes the whole texture and treatment is copied on the cylinder. As an observable instauce, no sooner did alpacus make a strong impression on the public and become popular, than their low tones and broken tints were instated largely in cotton prints, which almost changed their character from this circumstance, a low-toned surface or ground being adopted with slightly contrasting figures; they lost their own character to take up an unsuitable oue. Cotton prints are capable of being easily cleansed, and the whiteness of the material is a great cause of beauty, from its upp-aling to our sense of purity; this source of excellence is heightened rather than diminished by such a treatment of the ornament as contrasts with the general ground without covering it too much (see G F, fig. 4); when the ground, therefore, is entirely covered, as in these imitations, this appeal to the eye is lost, and, however suitable such patterns may be for the poorer classes, they take from the true beauty of the fabric. The contrary is the case with woollens; the material dues not admit either of the same easy purifying, nor has it the same native whiteness; the whole ground, therefore, may be coloured, or where its native hue is retained it must be more largely covered with the pattern. Thus fig. 2 (p. 1669) is a pattern of a de-laine manufactured by DoLIUS MEIG and Co., (1191, p. 1234) and shows not only a proper flatness of treatment, but an agreeable quantity and a due amount of the surface covered by the ornament, and is therefore suitable for such goods,

The consideration of texture and surface is necessary in the application of design to other fabrics as well as cotton, and to other means besides printing; thus colour, which has such effect on printed woollen goods, and shows with such richness and fulness in the ab-orbest material of de-laines and flanuels, where it may be used broken over nearly the whole surface, is upt to destroy more valuable qualities when applied in varied tints to the decoration of silk, and should be used more sparingly on this material either in woven or printed patterns, leaving large spaces of the ground naturehed, so much of the true beauty of silk residue in its Instrousness and the textural beauty of its surface. Of course this remark does not refer to self-coloured silks or to figured brocades in a self-colour, where the greatest brilliancy of colour does not interfere with the textural beauty, but only to weaving or printing patterns, consisting of many colours, too largely over the surface; the fact is, that a variety of colours tends to vulgarize both cotton, woollen, and silk fabries, and, although least objectionable in woollen goods, they want an attention to laws of harmony which either has not been given them, or is not easily attainable by those bues which chemistry has placed at the command of the manufacturer as comprising durability among their other qualities.

The proper treatment of texture has other considerations as respects the ornamentation of garment fabrics which may find a place here, although a little irrelevant to the present matter; graceful and elegant foldings are very important in all goods intended for personal weur, and many of the most heautiful qualities of materials are brought out by the interchange of light and reflection playing over their surface on the motion of the wearer; it is important, therefore, that no mode of decoration should be adopted to destroy this quality, even irrespective of the suerifice of proper utility which takes place in all works so overcharged with decoration or stiff from embroidery as to impede ease of movement and freedom of action in the wearer: the full lustre of silk more especially is dependent upon the folding, and every falirie is more or less influenced by the same cause. When gold or silver threads are introduced in the weaving, stiffness must result from it, and the skill of the designer should be so exercised as to give the greatest effect from the least possible use of such materials. This has been particularly understood in the Indian tissues, which exhibit the best effects under folding in a resnarkable degree, while the opposite error was noticeable in many costly priests' robes exhibited in the North-Fast Gallery, so stiffened with gold and covered with raised embroidery that the wearer must be eneased in them as in a suit of armear; the whole were not only vulgarized by excess, but were perfectly unsuited for use, and for the hest display of those ornamental qualities sought for. The priests' dresses exhibited in the Medicual collection had not this error; they were soft and flexible as the tissues of India, yet rich withal and fully decurated, suitable for use, and adapted to give the best effect in

The restrained use of means has often been before adverted to, nor is it unnecessary to recur to it in this section also; under the old and simple methods of cotton printing, when the resources were few and the means limited, the mind, that it has become almost a fixed idea connected

style was in some respects better than at present obtains, Thus block-printing by hand required flat forms and flat tints dispered regularly over the surface, and some simple flower or leaf so used had a pleasing and just effect, of which Peel's well-known parsley-leaf may serve as an instance. It will at once be seen that these qualities are herein advocated as principles, to be filled up and euriehed by more nudern resources, yet as necertained truths not to be departed from. In the place, however, of the former limited means, printing from metal cylinders has put at the command of the designer all those powers of more perfect imitation enjoyed by the engraver, and instead of using them as they should be used, consistently with the requirements of manufacture and the principles of ornamental art, they are wasted on the initation of finwers, foliage, and accidents of growth, quite out of ornamental character and opposed to just principles,

Having thus remarked upon the principal excellences and defects of design in this section, it is felt that the difficulties before stated, arising from the varied principles adopted by one and the same manufacturer, the large number of the works exhibited, and the impossibility of referring to any particular work alloded to almost entirely preclude any comment upon individual works. Generally, however, it may be stated that there is less dereliction from true ornamental art in woven than in printed goods, the powers of the weaving process being more limited than those of the printing process, so that varied tints and complicated farms fortunately present greater difficulties in production in the former than in the latter case, Thus, whilst the skill of the designer and, irrespective of principles, the taste of the printed silks of F. CHOQUEEL (1148, p. 1233), must be admired, a comparison with woven silks of much simpler pottern would certainly result in the favour of weaving. Of this some of the silks exhibited by CAMPBELL and Co. (Classes X11, and XV., 201, pp. 495-96°, are examples, as well as the Irish poplins of Raysocus and Co. (Classes X11, and XV., 266, p. 498), and ATKINSON and Co. Classes XII. and XV. p. 498). In these latter goods there is evidence of much taste, and a greater adherence to the principles herein laid down than in almost any other fabrics execut The mixed materials of Bradford and Hudthe Indian dersfield, and some of those of the same kind exhibited in the Zollverein by Messrs. RUBMANN and Co. (1 Zollv., 580, p. 1682), are also very satisfactory where those manu factures are not too attemptive; they bear the addition of ernde colours ill, and the low tone and quiet contrast of such goods are greatly in their favour. Silk, as has been before stated, is so rich a material in itself, that colour is hardly needed, and where used it should be with great eaution: the silk which forms the pattern on woven mixed fabries is in itself a bright contrast to the more absorbent woollen ground, and should not be forced into opposition by hright colour; and in all cases the chance of error is diminished by abstaining from colour in pattern rather than the contrary: that crude colour is most dangerous in silk goods is shown in the very feeling that prompts to moderate it in chine sak, wherein the pattern is blurred and made more undefined by the process of dyeing to get rid of the erndeness that must be caused by printing in colnar on the finished material, and which would almost reduce silk to the grade of glazed cotton or chiutz,

SHAWLS.

In the section of garment fabries, design as applied to shawls has been reserved for a separate head; not so much from the importance of the manufacture, although even for this reason it would call for careful consideration, as that it leads to the examination of the principles on which these fabrics were decorated in the countries from which this article of dress has been derived to us.

The exhibited "designs" come first under notice: these are almost exclusively by French designers. The beauty, excellence, and costliness of the shawls imported into Europe from the East have united the Cashmere pattern so intimately with these fabrics in the public with them, sold is conceptually thought indipensable to the manufactors that Jacobs forms and Eastern tests—ments should be applied to three poets. Thus for a long test that the state of the sold of

There is nothing more difficult than to disabose the world air noted error, and as the unditided, who rancy understand the true cause of excellence, have adopted to the contract of the contraction of the contraction of temperature of the contraction of the contraction of the form is supposed to be necessary to the safe of also is to form in supposed to be necessary to the safe of also is to form in supposed to be necessary to the safe of also is to feature in all the European instantance and repetitions of those goods. But there are principles of exactlence in the designs from Inalia and the European instantance and repetitions, the forms alone will happy but fitted to wantable the clear to contamily all help but little towards the rise declets no contamily

found in those works. The Indian pine, moreover, is not present in all Cashmere shawls; in some it is either greatly suppressed ur cutirely absent. Whatever may have been the cause of its introduction there, whether as a sacred or intional symbol, or as used only for the supposed beauty of its curves, its constant repetition in works intended for European wearers is, to say the least of it, a cause of great monotony, and implies a want of invention on the part of the designer, whose skill should supply some novel application of ormment to such fabries to wean the public from this stock idea on the subject. But in doing this, care should be taken to keep in mind those principles which are the true cause of the beauty of the Indian fabrics, comprising their treatment of form, trestment of coloor, beauty of line, and due consideration of the ma-terial. The treatment of form is one of the essential excellences of the Cashmere designs. The objects used in ornamental decoration are always, for woven fabrics, treated quite fistly, as is the case, indeed, in all the Eastern and Indian works, whether these consist of ornamental forms having no apparent relation to natural objects, of flowers, foliage, or even of birds or animals. There is hardly any tustance in which this rule has been overlooked. Moreover, excepting in the ground, large masses are rarely introduced, but large lending forms as the ludian pine, before spoken of are filled in with a minute diaper of smaller forms, mostly flural, and the beauty is enhanced by the graceful curves and elegant flow of these leading lines. The colours also are subject now of these remains much. The commission are suggested a general rule; they consist of simple flat timts without shading, each flower, or petal, where flowers are used, each leaf in foliage, being rendered by one tint. In the best Cashmere shawls these inner dispering forms are very minute, and thus a broken texture of colour is given to the surface ornamented. The tiuts, where in large masses, as in some of the embroidered ornament, have rather a tendency to secondaries; thus purp green, and gold prevail, and the red is inclined towards the colour of the pigment called Indian red, or in some cases to pink, which is a diluted crimson (a red with blue in it; thus the general has las rather the direction of coolness; this is particularly seen in the carpets also, both Indian and Persian, as has been before remarked. In the Cashmere woven shawls, if pure tints are used, which may be the case, these tints become broken by the mixture of colour produced by the threads of other thus coming to the surface in them in the process of weaving, thus neutralizing their force and producing the same negative tendency; invariably flat forms without perspective or imitative rendering, flat tints without shading. and single lines of the same colour, are the principles of the designer. The due consideration as well of the ma-

terial as of the use to which the fabric is to be applied is evident both from the nature of the ornsment, which never draws peculiar attention to itself, and from the texture. since, notwithstanding the use even of metallic threads in the ornamental design, the Indian fabrics seem never to lose the property of flowing in beautiful folds, and adapting themselves to every motion of the wearer, an excellence not so constantly present in the European manufscturers. Now the French designers, to whom it seems clear that manufacturers are almost wholly indebted for their designs, although they have made much study of principles, seem either to have overbooked some, ur to have willingly ignored them; either in deference to or to make wintingly ignored them, enter it negeriate to the ruling idea entertained by the public, or in order to obtain novelty; but novelty should never be sought at a sacrifice of truth. Let the designer throw away, if he pleases, the Indian forms—the Iudian pine form, perhaps, the sooner the better, since it never had any symbolical significance with us, and it has long ceased to have beauty of line, tormented as it is into every possible variation, from the normal form—and avoiding mere imitations endeavour after a treatment in harmouv with European

taste and feelings. Thus, for instance, geometrical leading forms are sometimes used in the Cashmere shawls, and such treatment might be most successful in the hands of European artists considering the varied and complicated combinations of flut forms open to their choice. The Byznatiue tracery, flut forms open to their choice. The Byrantine tracery, guillochés, or even the graceful forms of the Remissance, if perfect flatness were preserved, might be dispered with colour in the Indian manner; but the tide seems to have set in quite the contrary direction, - the leading forms of the Eastern patterns are kept, the just principles are disregarded: the Iudian pine, exaggerated aften to extreme caricature, is applied not merely to shawls but to other goods; the disper, moreover, instead of being flat, is composed of flowers often the size of nature, imitatively and perspectively drawn, and sometimes most elaborately shaded. Thus simplicity is lost—the principle of flatness is totally disregarded—the colour not being in that tints, and the broken texture of surface entirely done away with; the result has a certain showy beauty, but it is meretricions and unsound; it may be the novelty of a season, but it is built on a false foundation and will pever

There is a circumstance connected with floral ornament which hardly seems to have lad proper consideration; it deserves, however, some attention. Many of the flowers used by us as ornament are not in a state of nature, but have already been subjected to another art, the art of the horticulturist, subjected by him to a process of cultivation which unnaturally stimulates the growth of the parts, and by means of which, the stamens being converted into petals, the flower becomes doubled and rendered artificial more beautiful, perhaps, as a flower, but less tractable as ornament, and far less simple, far less fitted for that flat display which is required by some fabrics. By these means the five-petalled rose, the five-petalled pink, &c., become a hunch of petals; and if we would see how er tirely some flowers are thus rendered artificial, the dahlia may be instanced as an example; in its simple state it has a single border of petals with a central disk .-- by cultivation it is a cluster of petals, so regularly disposed as hardly to be distinguished from a rosette of rabbour made up by the milliner. Flowers in this state are already conventionalized by another art ere the designer takes them in hand, and the result is analogous to the case of the artist who copies the actions and passions of the stage instead of seeking them in their simple reality in common Moreover, flowers in a natural state have simple and clear characteristics which they often lose in cultivaand clear characteristics which they often lose in currention, and it is the difficulty of duly expressing them, as artificially changed by cultivation, that seems in some degree to have led to the false manner of treating them

in the ornamentation of woven or printed fabrics.

To return to the consideration of the filbrics themselves. The new mode of varying the Indian treatment above described is not so prevalent among the "designs" as it is in the fabrics exhibited, only one exhibitor of designs for shawls showing example of this extreme depar-

ture from the true style in his works. The relaxation of just principles is, however, seen, even in those which purport to be simply imitations of Cushmere designs; it is shown in the introduction of small landscapes on the spaces of the ground between the large leading forms; in representing in the pattern borders of ornament quilled or gathered in the manner of a fringe; and in the spaces filled up with small disperings being imitative of foliage, onlim-trees, &c., instead of being merely flat, graceful, and flowing ornamental forms. So far from endeavouring to suppress povelty, it is most desirable to encourage it as far as possible, since true novelty is not an extreme characteristic of the present time, but it must be sought by other means than those reprobated; the designer must not suppose that by exaggerating a secondary charac-teristic of style into nudue importance, and adding new materials cutirely out of harmony with it, anything really beautiful and new will be likely to result.

In the shawls exhibited this new manner is seen to be very widely spread. The greater number of those on the Foreign side, both printed and woven, are thus ornamented, and Norwich and Paisley are following in the same track. One French house exhibits two woven shawls in juxtaposition, which may serve to compare the two systems. The one is an imitation Cashmere shawl, consisting of straps or bands filled in with gracefullycurved ornamental forms, powdered over with estour in the usual manner, the Indian pine being slightly visible only in the border. The other design is to the new manner; it displays very great ability and eleverness, and in most skilfully manufactured. In it the Indian pine form, ex-aggregated in all its peculiarities, is filled in with imitative flowers, the size of nature, naturally drawn and shuded, with such minute imitation that even insects have been depicted on their surface. The variegation of some flowers, as tulips and asters, and the shading of others, as roses, &c., is substituted for the dispering of cole which is characteristic of the style; simplicity of tint is therefore lost, and flatness wholly abandoned; great pains and labour have evidently been bestowed on the design, yet the result contrasts unfavourably with the neighbouring Cashmere pattern, the negative colour of this last being much more satisfactory than the hot appleasant huc of the former, arising partly from the shades containing more colour than the local hue of the flower, instead of being more negative, and more especially from the impossibility of introducing the contrasting and harmonizing tints exactly where necessary, which can so easily be be hoped that this false manner will be abandoned; that wheo imitations are intended they will be in a pure style, and when povelty is sought for it will not be attempted by thus outraging true principles.

RIBBOSE

In examining design applied to ribbons it is necess to have especial regard to their use, and the purpo which they are intended to fulfil; for although many of the principles which have been laid down as regulating the decoration of garment fabries are equally applicable to them, these principles are modified by the place which ribbons hold, largely partaking, as they do, of the nature

of orannests added to the other portions of the dress.

It may be said that, when the dress itself has smeh pattern, ribbons, which serve as bands marking the leading lines, or as borders, should be plain in colour and without much enrichment; their office is cootrast, and either simple colours or stripes in that case are most desirable; but when the garments themselves are plain and unfigured, or figured without strong oppositions of light and dark or colour, then the ribbou may become a true contrast by its ornamentation, and require marked frue contrast by its ormanicuscion, and requisite forms and colours to give that expression which is so requisite. When regulated by good taste, ribbons, beside giving effect to form by their contrasts, serve another important purpose, by being the means of introducing heightening which, when judicious, is a great means of enhancing its effect, and giving richness without gaudiness. This use of ribbons points unt their proper ornamentation, which should be in simple forms, permitting the introduction of pure tints; these require a geometrical arrange ment to give them adequate force and expression, and for this purpose the patterns of the Indian tissues offer most valuable suggestions to the ornamentist; even the introduction of gold and silver may be taken advantage of as a very suitable enrichment for these ornamenting fabrics, It is to be regretted that the great prevalence of natural floral treatments as the decoration of garment fabries has caused the adoption of the same style in ribbons, where it is more peculiarly out of place, and that the rarest efforts of the designer, and the greatest manufacturing achievements, have been misapplied to overcome the difficulties this treatment induces. The design of the Coventry ribbon, treatment manees. The design of the Coventry Photon, for instance, apart from the style adopted, is one of great merit, more successful than the best foreign efforts in the same direction; hat while it is a rare proof of difficulties attempted and successfully overcome, it is also a proof of misapplied excellence and unsuitable ornamentation, being based on the artistic principle of imitation rather than on those proper to the ornamentist, abstract beauty of form

There is an evident tendency to gaudiness and over decoration in the greater number of these articles exhihited, and it largely arises from the above cause. interes, and it argery arries from the above came. The incremsed width these goods are now manufactured, and the wrong direction of the decoration applied to them, have greatly altered their character, and we find land-scapes, figures, portraits, and all kinds of matural imitations, applied as their ornament. It is pleasant, in the face of so much that is erroneous, to ootice the just taste exhibited by one manufactorer of these fabrics: the silk ribbons of Bussox, sen. (France, 1125, p. 1232), bave a character entirely their own, the ornament consisting of geometrical figures in gold-coloured silk, dispered over a plain ground of some delicate tint, or borderings of geometrical ornaments on the same principle, having an analogy to the Indian patterns without imitating them, and being very appropriate for the intended use of such fabrics.

The concluding subject of this section of garment fabrics is lace design. Lace is assimilated to certain other classes of fabrics by its uses as well as by its peculiar qualities; thus, to worked muslins, for instance. in its general lightness, and in being usually without colour either in itself or in its ornamentation; and to ribbons as being an ornamenting fabric to other parts of dress. It is one of the peculiarities of lace that it is necessarily ornamented, since, without some pattern npon its surface, it would hardly retain its name. Its characteristics of lightness and filminess of texture should never be forgotten in its ornamentation, which should essentially be light, elegant, and flowing; all straight lines should be avoided, not only from the necessities of the manufacture, but because graceful forms are required to pervade its ornamentation. At the same time this textnal lightness may lead into the opposite error, and the ornament be so filmsy as entirely to lose proper point and expression; and thus, where lace is used as a trimming, the line which it is intended to enforce or enrich be inefficiently marked from this very meagreness. The old point lace, worked with the needle, was uften too heavy in character, from too equal a distribution of the masses of its ornament; it wanted less crowded spots to give value by contrast to the general surface; whereas the modern lace, from the object of the manufacturer being to cover large spaces with little work, too frequently errs in the opposite direction, and wants parts of more full enrichment to give it point and character. The border or edge, which in reality constitutes the true lace, should have the most solid and marked ornamentation, out of which should grow graceful curved furms, less marked hrilliant portions of pure colour complementary to the and pronounced, gradually passing, in wide lace or in general masses of the dress, thereby, when the pervading | veils, &c., into dispers of spring or small ornamental tone of the dress is negative, giving that brilliancy and forms over the remaining space. While the natural lines of the growth of plants may be adopted as the ornament of lace—for which they are very suitable from their elegance and variety—subjected to a symmetrical arrange almost
The great excellence of the French and Heights have receive to consist more in the trace appreciation of heaving of line and defiring of firm, than in any very marked interference of the second of the second of the contraction of the second of the second of the second interference of the second of the second of the tracelor in any flowered. There is, moreover, among tracelor in any flowered, there is, moreover, among tracelor in the second of the second of the second tracelor in the second of the se

As compared with the important exhibition of the manufactured article, there are few "designs" for lace on the Foreign side; and the best of those are m remarkable for execution than for any particular origi-nality, viewed relatively to the beautiful fabrics themselves. On the English side there are some designs for lace curtains, and one for a lace veil, founded on Brussels patterns, by H. HEALD (Class XIX., 259, p. 570), of Nottingham, which has merit. There are also several designs exhibited by the students of the Government School of Design, some of the most elaborate of which, by C. P. Sloconie (10, p. 821), and T. Rawlings (10, p. 821), have been extremely well excented in Honiton lace by Mrs. Taxpwis, of Exeter (Class XIX., 55, p. 561), and Mr. Gill, of Colyton (Class XIX., 386, p. 573) The designs are novel, but a little too arehitectural in their general arrangement, resulting in a slight degree of stiffness, and a want of that flowing case which should characterise the ornament of the material. The female students also have some clever designs for lace, beautiful fabrics exhibited will have their due share of nttention from the Jury of the Class for the manninetured article. Nome of the best design is to be found in the works of Gnorcock and Co. Class XIX., 3. p. 559-60), Formest and Son (Class XIX., 45, p. 561), and those already mentioned. The Nottingham lace curtains, although not to be commended for their design, show a tendency in a better direction than the Swiss worked muslins; the treatment is generally fintter, the horders better considered for quantity, and, in some of these works, a disper over the central field has been adopted with good taste. In these goods, and in machine luce, some of the best designs are to be found in the fabries of HEYMANN and ALEXANDER (Class XIX., 25, p. 560); and R. Berken (Class XIX., 20, p. 560), has one or two well-adapted designs for narrow machine lace also. On the Foreign side the Belgian and French lace. from the grace and flow of the leading lines of the ornament, and the greater delicacy and refinement of the forms, together with the better appreciation of just quantity in the distribution of the parts, apholds the acknowledged superiority of their manufacture. The English lace, especially the hand-worked lace, seems rather to call attention to the labour hestowed on it as a part of the excellence; the foreign lace, even when greater labour las been employed, strikes us as rather eleganal and beautiful than as laborious and costly, from the more casy and playful forms of its decoration. These qualities entirely accord with the nature of the fishric, and charm as more when, on examination, we become sensible of the curious claboration which often accompanies them.
The lace cuffs and berthes of B, Vannea Keller (Bel-Inc see cuts and berthes of B. VANDER KEEN (Belgium, 313, p. 1161) include some of accellent design; and also the lare exhibited by Van Harlen Belgium, and also the lare exhibited by Van Harlen Belgium, 299, p. 11600; B. Deulanous (Belgium, 314, p. 1161), and F. Audiat France, 1345, p. 1250). On the whole there are fewer errors in the design for lace than prevail in

most other manufactures, partly arising from its circumscribed miture. Besides the faults enumerated in the foregoing remarks, the tendency to the natural imitation of flowers is seen in some of the Honiton Ince.

Having passed in review the various sections and subsections into which this Report has been divided, it might, before concluding, be thought desirable to con-sider the best means of obviating the various faults observed and commented upon in the course of this examination: this, however, would be too large a subject, and one not necessarily within the nature of the Report itself. The public and the manufacturer, both equally interested, and whose improvement is equally accessary-for to be useful it must be mutual- are now awake to the necessity of better education in design; and the question naturally arises, whether the means adopted in the Government schools are the best possible for the proposed end, or whether it would be desirable to extend their scope, so as to make them not only schools of design, but in some degree workshops, where the specialties of design may be fully explained, and the due application of ornamental art to manufacture thoroughly exemplified and carried into practice.

This spection, however, it would, and has reference to two clause, who make marine and quilification are not to two clause, who has marine and quilification are not to two clause, who make a comparison of the transact of policition and the percedule recovers of the means of policition and the percedule recovers of the sound that the second of the means of the same and the sound of the provided upon the same and the result of the same and the s

of the manufacture he is engaged upon is absolutely necessary; it is his starting point as an education in the technicalities or processes of ornamental art is the starting point of the designer. What the art-workman has to add to his manufacturing knowledge is, such an amount of nrt as will enable him thoroughly to appreciate and perfeetly to carry out the work of the designer, without which, indeed, he is imperfectly educated in his trade; while, on the contrary, the designer (not necessarily a workman) has to obtain such an insight into the pro-cesses of the workman or the machine as will enable him to fit his design to the difficulties of production. Like the artist and the orgamentist, the two classes, whilst generally distinct, sometimes merge into one another, from which cause the question has been unnecessarily obscured. The truth is, that while, in some cases, it would be most desirable that the designer should understand the minute specialties of the manufacture, in others it is nearly unnecessary: while the art-workman's province is quite sport from the imaginative, and all that he requires is a full acquaintance with the technical means of art, such as drawing, modelling, chasing, painting, &c. In these he cannot be too fully educated; but since the large mass of those who are to be justructed are of this class, it is obvious that the principles and practice of design need not necessarily form a part of the education in all schools of ornamental art,

This view of the question does not interfere with those special cases so often alluded to in this Report, wherein, from the high requirements of the material, or of the object itself, the artist-designer is at the same time the artist-workman also, and embodies and produces his own conceptions by his own skilled handierals.

The general truth seems to be, that when a designer has thoroughly mostered the technical Isaquage of art, and the general principles of design and its application, the amount of special knowledge sufficient for an purpose is specially acquired in any branch of manufacture to which he may devote his attention; and in all cases more sufficient to the special control of the special control of the special control of the special control of the most beautiful results, will arise rather from a full insight into the means at the manofacturer's command than from

any technical education in those means This, however, is not the case with the art-workman; to give him proper instruction in carriag, chasing, endossing, printing, &c., it should go on consecutively with his learning the technical elements of art, and his perfection as a workman will be measured by his power of embodying his art-knowledge in his trade labours. The process, noreover, is n tedious one, requiring the hand to be educated as well as the eye and mind, to enable him successfully to combine art with handicraft; and it would seem, therefore, that such labours are essential parts of true

schools of ornamental art.

Yet the several requirements enumerated are partial and local, and not to be made a part of general so much as of local education. Thus, since London and its vicinity are the seat, more or less, of all manufactures, and of the highest efforts of those manufactures, for this reason, and as a central normal school, it would be advantageous to embody in the course of the London head school instruction in all such matters; but they could only be partially useful in the provinces; as die-sinking and chasing, for instance, at Birmingham, chasing and embossing at Sheffield, modelling and painting in the Potteries, &c.; and it being ascertained which are the proper localities for central provincial schools, their peculiar arthandiersft should be taught therein, and the instruction obtained in the surrounding districts he of such a charecter as to prepare best for the higher instruction of the central provincial school. The trath is, that our schools have all been accidentally founded, rather than ou any general, comprehensive, and well-defined principle: and before proceeding further, it is very desirable to have some well-arranged distribution of the means of instruction for the whole kingdom, laid down in accordance with local wants and local seats of manufacture, to control and regulate the whole, so that schools, when founded, should fall in with a pre-arranged and predetermined system. These remarks are made with no intention to dogmatise on the subject, which should rather be viewed practically than theoretically, and the solution be based on known results, rather than inferred from any supposititious points of view. The great public establishments of France, both of the Gobelins and Sevres, would on this account demand especial attention and consideration, since the fabrics produced therein have attained a greater excellence, both of design and manufacture, than is seen of what is meretricions and false, and to a more simple, elsewhere; and it would be desirable to gain full informa- grave, and earnest style in modern ornament,

tion as to the knowledge of art obtained by the workmen. as well as of the processes of manufacture by the designers in those celebrated manufactories. In the some vicw, the schools founded for the instruction of the brouzists of Paris, and in which they mostly obtain their art-education, should have a full share of attention, both on account of the reputation gained by these works for artistical completion, as well as the great faney and in-vention displayed in the Parisian bronzes. While our own Mediaval Court and the clever revivals it contains will show the influence on manufacture of an educated designer acquainted with the various processes of the manufactures for which he designs, and apparently con trolling both the manufacturer and his workmen in their production, we have to learn, in the former instance, whether the workmen have any, and what amount of, education in design, and whether their investire powers have been stimulated, or only the most perfect technical acquirements obtained; on the other, we pretty well know that the workmen have obtained but little even of the technical lunosor of art, and that in invention they are entirely led by the designer.

The condition of the schools at Lyons also, and their routine of instruction, would furnish much valuable information on this subject, since, in the manufacture of silk, the relations between the art and the means of exeention are most intimate and complicated. They would show whether the education of the workman in art, and in many cases the exalting him into the place of the designer, has resulted in a pure and just orannentation of the fabric, or whether it has led to the skilful appliance of manufacturing means to the production of difficulties of execution in these fabrics, rather than to the simple and the beautiful in their ornamental decoration

In conclusion, the Reporter may be permitted to express his sincere regret at his own shortcomings. It will be evident, on the perusal of the Report, that there are evident, on the perusal of the Report, that there are many omissions, and that important subjects have been treated with great hrevity. Almost entirely deprived of counsel or assistance from his fellow Jurors, this task being nearly altogether out of their jurisdiction, and only undertaken hy him after the Jury labours were con-cluded, he has to ask for a large share of indulgence. He trusts, however, that a proper spirit of inquiry into the sources of true excellence in ornamental art may be elicited from his brief labours, and lead to the rejection

London, November 1851.

1851.

THE EARTH IS THE LORGE AND ALL THAT THEREIN IS: THE COMPASS OF THE WORLD, AND THEY THAT DWILL THEREIN.

This Work forms a complete Scientific, Historical, and Illustrated Record of the Great Exhibition of 1851, It has been prepared with care from the descriptions of their own articles furnished by the Exhibitors themselves, with the assistance of a considerable number of men of science, eminent in the different departments embraced by the Thirty Classes into which the Exhibition is arranged. It is in addition furnished with a large number of Illustrations of the most interesting and important objects of art and industry, The Catalogue comprises extensive original Notes and Papers on various subjects, which are intended to

communicate to it a value enduring beyond the period occupied by the Exhibition itself, and to render it permanently interesting to readers of all classes. It has been prepared with the assistance of the following Gentlemen :-

Professor OWEN, F.R.S.

Baron Justus Liento, F.R.S. Professor LINDLEY, F.R.S. Professor Forbes Royle, F.R.S. Professor Bell, F.R.S., Sec. R.S. Professor E. Forbes, F.R.S.

PREFACE TO THE OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE,

PERHAPS no statement connected with the appearance of this work is calculated to create more surprise than that the greater portion of it was netually in type prior to the first of May. Its condition at that period may be thus described. The manuscript accounts of the articles of a large number of the Exhibitors had been compiled, set up in type, and subsequently condensed, annotated, and up in type, and subsequently condensed, annotated, and revised, and required but a little more attention to fit them for publication. In addition, a large proportion of the illustrations were completed and fit for printing. But at that moment, what was the condition of the Exhibition Building itself? Only on the morning of the first of May were tickets affixed to a few articles in a few Classes, and the position of many Exhibitors, even on the British side, was not finally determined. This arose out of the efforts made to obtain a strictly classified prrangement of articles on this side. Many articles placed in the hurry of preparation in the space allotted to one Class were improperly thus placed, and required to he removed to other Classes; and a large number of explanations were found to have been received from Exhibitors who bad ultimately not been able to send in their goods in time. Whilst many Classes were arranged rapidly, others remained, owing to peculiar difficulties, in a state of great incompletion, and incessant alterations of the numbers and positions of the Exhibitors were necessary before they could be considered perfect. During this time, which is to be reckoned by weeks rather than days, the number of additional manuscripts received from Exhibitors who had neglected sending them in until long after the opening of the Exhibition, was immense, and the adjustment of the additional matter thus created was

in itself a difficulty not to be easily subdued, While an amount of order-surprising in its extent, though imperfect in the degree requisite for the publication of a work so couldy in its preparation as the present
—reigned on the British side of the Building, the state of
that devoted to other nations could scarcely be entitled to that term until a mouth subsequent to the day of opening, Many foreign states had not sent in their catalogues, and the arrangement of their productions was very imperfect.

The peculiar nature of the Catalogue, also, as a work

produced by many thousand authors, naturally brought npon it, through the medium of the small Catalogue, the corrections of a large number of those whose manuscripts formed its foundation, in addition to those rendered necessary, in order to obtain some degree of uniformity in the literary composition.

The combination of the elements of disorder thus presented has never before arisen to oppose the publication of any work in this or other times; and its effect upon its preparation is only to be estimated by those who have watched its progress, and are familiar with the complicated arrangements necessarily preceding the production of any printed book containing illustrations. The great extent of the Catalogue rendered the disturbance of any of its parts absolutely fatal to its publication in a reasonable time, and oven in a moderate condition of accuracy. In the midst of all these adverse circumstances an attempt was movie to publish it as speedily as possible after the opening of the Exhibition; but this attempt was rendered fruitless in consequence of the alterations of position in that already set up.

Under these circumstances the Contractors, auxious to produce so extensive a work in as perfect a condition as ossible, resolved, at considerable loss to themselves, to delay its appearance until every alteration of importance had been made in the arrangement of the Building and by Exhibitors themselves. In this state it is now published, and is intended to serve as a lasting memorial of the splendid collection of which it professes to be the exposent. When its magnitude is considered, and due into moding which is not in harmony with the spirit of regard half to the great difficulties inseparable from the the motor on the title-page; and, while descriptive of the production of an illustrated book of this kind, it must be acknowledged that the period occupied in its published that the period occupied in the production of the productin of the production of the production of the production of the pr

ention has been comparatively brief and its preparation

The due appearance of the smaller Catalogue, on the first of May,—in itself, perhaps, one of the most remark-able instances of rapid typographical execution ever accomplished,—is also an indication of the substantive pre-existence of the present work before that date, since the smaller Catalogue is only a very condensed summary of the present, and was derived from the material forming the illustrated edition. The difficulties attending the publication even of that work, may be gathered from the fact, that only three days before it appeared was the order of succession and temporary arrangement of the Exhibitors in the Building determined on; and in that short interval, and before its publication, their arrangement in the Catalogue had much of it to be made. For an account of the method adopted in the pre-

paration of this Catalogue reference should be made to another page. It is, however, due to those whose valued assistance has added so much to the permanent interest assistance mis source or many to the state, that there are several portions which could not, by pressure of time, be submitted to the benefit of their revision, and for such, and the general scientific accuracy of the work, the sub-scriber to this notice must be considered alone account-

able. That the following pages are to be considered free from technical and scientific inaccuracies could scarcely be expected; but much care and labour have been expended to give them, as far as possible, this character,
The consideration just named may also render expedient

if not necessary, a simple statement of the part fulfilled by the writer in connection with this work. The production of the general plan of the book, its development, after sanction by the Executive Committee, and literary construction out of the crude material obtained after compilation from the manuscripts of Exhibitors—this material resulting from the official instructions given for the compilation of the Catalogue, and the term compilation including, in this case, merely the rough preparation of Exhibitor's manuscripts for setting up in type, the resulting matter being consequently in a very imperfect state -with the general literary and scientific apportatedence and management of the work-these have formed the occupation of the writer in connection with it, and for these he may be held responsible. As the result of the combined labours of the scientific annotators and of the combined labours of the scientific annotators and of the writer, and after having reveived official sanction and revision on the part of the Executive hy the officer appointed, this Catalogue is now put forth. The constant effort of the writer bas been to prepare a work of permanent value and cadming interest. May it be shown in the issue that the labour bestowed upon it has

not been in vain. At the period when this work makes its appearance in a complete state, the Exhibition is about to close. The first function of a Descriptive Catalogue can therefore scarcely be fulfilled ere the great spectacle it illustrates will pass away. To those wonders of Art and Industry which man, taught by God, has been by Him enabled to accomplish, it will prove a guide but for a brief period. But its more permaneutly valuable offices then commence; and it may be reasonably hoped that, as a record of the most varied and wonderful collection of objects ever beheld, and as a book of reference to the philosopher, merchant, and manufacturer, it will constantly prove both interesting and instructive to the reader

It is probable that, with the return of the Exhibitors and of the articles to the numerous localities abroad whence they were derived, copies of this Catalogue will be sent, and taken also, and that these pages will be read in many lands long after the Exhibition shall have become matter of history. May they be found, on examination, to con-

ROBERT ELLIS.

OPINIONS OF THE PRESS.

"No work published of lase years has a history so remarkable as that of the Official Cutafron. The work was already designed in 1850, and the right of publication was recorded by the order of the cutafron of the cutafron cuterrained of its plan or ever of its authorship. Utilmately it was decided that the exhibitors themselves should be the subton; and with a view of assisting the prives for their guidance. The result of such a decision can be more easily insigned than described; and the labours of the cellors, Mr. Robert Ellis, in redering the labours of the cellors, Mr. Robert Ellis, in redering the Hercelors.

"The three volumes may be divided into four parts. First, the introductory matter, comprising a history of the enterprise by Mr. Henry Cole, an account of the building by Mr. Digby Wyatt, and of the compilation and revision of the Catalogue by Mr. Robert Ellis, a classification of the objects by Dr. Lyon Playfair, and a map by Mr. Peterman. After the introductory matter come, secondly, the entalogue proper, written by the exhibitors in the manner above described; thirdly, the system of introduction to elasses and countries, with scientific annotations; and fourthly, the illustrations. Of these four quarters, the chief popular interest will probably attach to the first, and especially to Mr. Cole's introduction, which tells the tale of the origin and progress of the Great Exhibition. The anthor glaneing back observes that such institutions as industrial displays, in which the race is for excellence, and direct commerce is not the primary object, have taken and affect commerce is not toe primary copies, may taken place during the last century; and be dwells with proper emphasis upon the fact, that from the first they have been entirely originated by individuals or societies, inde-pendently of any Government assistance. He then gives a sketch of the various minor exhibitions instituted by the Society of Arts and other societies, with a passing allusion to the important subject of the national exhibitions of Frunce. Perhaps a greater detail was desirable on this part of his task, counsidering the importance that was ttached to a report on the last French Exposition by Mr. Wyatt, which undoubtedly furnished valuable elments in matters of detail towards the development of the Great Exhibition itself. To this succeeds a complete history of the nudertaking, showing its adoption by Ilis Royal Highness Prince Albert, the origination by him of the great idea of summoning all civilised nations to take part in it, the early difficulties through which the promoters of it had to struggle, and the arrangements mecessary to its proper ordering and final institution.

Mr. Cole evidently considers the great feature of this
Exhibition to be the thorough development of the selfsupporting principle on which it was catallished. We may take the following as the expression of a very general feeling on the part of the Royal Commissioners upon this

These who have had reprience only of the Couliment systems of collisions, which we managed and surrical systems of collisions, which we managed and conferenced the collisions and effective principles and the collisions of the collisions of the helpide should be collisions of the collisions of the helpide should be collisions of the collisions of the helpide should be collisions of the collisions of the helpide should be collisions of the collisions. The principle collisions of the collisions of the collisions of the collisions of the face and the underliked responsibility, not only of contacts and the underliked responsibility, and only of contacts of the collisions of the collision of the collisions of the works on a satisface of the collisions of the collisions of the collisions. On Satisface Exclusions are not been charged with these. On Satisface Exclusions are not been charged with

In payment of the militery and police assistance which to Government, has presented to be employed on the oreasten. No enspired popularisms has been the organism-incipal connection, the opportunities of the contribution of the fact of the contribution of the fact of the contribution of

OThe result has demonstrated the wisdom and the ruces attendant upon this career of honourmble independence, and has taught on a grand scale the truth of the popular aphorism—Heaven helps those who help themselves.

"Mr. Wyatt's account of the construction of the Crystal Palace is a good appearent of an architectural paper, par-Palace in a good appearent of an architectural paper, reader. It is divided into two parts—she first treating of the building as it atand; 'the second,' of its creation.' The progress of the structure is traced in this paper from The progress of the structure is traced in this paper from the progress of the structure is traced and the paper and the paper of parts are also as the paper of the paper, and contains an internal paper of glass. The subplaced extract will indicate the general character of the paper, and contains an instendant appear the progress of the Exhibition Initialing;—

The change of the same one of presented formulated infinitely, from the difficulties, from the system of present of the system of the state of the system of

To exching the men sat at the end of the platform ment to whater work hall been late done; from which they pushed the stage backward sufficiently far to allow them to lasers i spon of glass, mid a soon as that was the stage of the stage of the stage of the stage of the interrupted (produced to the stage of the stant and west ends interrupted) (produced to transpire the team and such as the interrupted) (produced to the stage of the stant and west ends working the machines was very remarkable. By mean of them 50 men in one week put his purposited [51,339 panel of gloss, being not less than \$62,500 feet unperful. The was 100, being \$62,760 feet (before of gloss).

⁸The third introductory article treats of the difficulties through which the Catalogue had to pass, from its first stage, as exhibitors' manuscript, to its completion in in prevent form. No person can read it withmut wender that after such a complication of perplexities the book ever made its appearance. The following givens notaline of one of the first troublet into which it fell in its progress towards perfection: —

*So soon as the work actually commenced, a mechanical difficulty of no commen proportions precented incid. On the distribution of proofs for the purpose of annotation and incomparison of the proofs of the proo

same form and order as that assumed prior to their dispersame norm and other as that assumes prior to their subpre-tion. The substitute of the and immediately affixing the proper place of such a minute strip in a work of such oughttude as the present, seemed to be great. A simple method of ascertaining, not merely to be great. A simple method of ascertaining, not merely the place in the Catalogue, but its entire history, its desti-nation, annotator, and return, was, however, contrived, and the history of every proof has thus been accurately re-corded. The information thus obtained was so necurate and precise that on the temporary delay of very small proofs their destination was instantly discovered, together with the date of transmission and the name of the annotator must me uses of transmission and the name of the annotative to whom they had been sent. Much ponentiality characterised the return of the dismembered portions of this large volume. Had not such been the case, the original plan of scientific and technical revision could not have been persisted in."

" Of the classification of objects compiled by Dr. Playfair, with the assistance of eminent persons in the various arts, we can say no more than it is an elaborately accurate skeleton of the philosophy of industry and art.

"The Catalogue Proper is thus arranged:—i. United

Kingdom, classes 1 to 30; British Colonies and Dependencies, which are thus subdivided—a, British possessions in Asia; b, in Europe; c, in Africa; d, in America; e, in Australia. To these succeeds the portion of the work devoted to Foreign States, commencing with Austria and ending with the United States. The British Catalogue extends over 1,002 pages, the Foreign over 470. In the former are iscluded the united catalogues of almost all of our colonies and dependeocies, with that of Great Britain ; in the latter are the distinct catalogues of every Foreign State, even when, as in some cases, these were not ren sented by more than two, or even one, exhibitor in the Industrial Palace

"It would be impossible to give an adequate idea of this portion of the work without such copious extracts as would swell this notice to an unusual and inconvenient length. Besides it might happen that the sacrifice of our space would receive on adequate compensation in the ap-probation of our readers. The wagaries of exhibitors, which would undonsteedly have proved amusing in their original shape, have necessarily been toned down to an noiform monotony, and the task of selection would be odvantageous neither to render nor reviewer. Something, however, should be said of the annotations, which form series of short and pithy notes, which will always make them not less interesting than instructivo to readers of every class and position in society. Their essential cha-racter is less commentatoriol than elneldatory. They ore exclanations and additions—unt criticisms. They ore intended to give value to what might otherwise have eccaped appreciation, and importance to subject whose significance the general reader might not have otherwise ength. They often consist, it is true, of simple enuncio-tions of known facts; but they are so associated with the text as to give nanual force and prominence to the most nuiversally accepted truths. At the same time the octual amount of information they embody offers a very com-plete view of the sciences which are now daily ministrant to industrial progress.
"We regard the introductions to the different classes

ond countries as among the most valuable portions of this work. They are all, with one exception, the production of the scientific superintendent of the work, Mr Robert Ellis, who has contrived to indicate distinctly in a single page the most prominent objects of every class or dependency

"The addition of an index of nomes and a separate one of subjects adds great value to this Catalogue. system of classification renders the work of easy reference to the end of the Catalogue of the United Kingdom; hot beyond this it would have been of little use to the reoder without the indexes. In fine, these volumes may be accepted as a very valuable addition to the stock of useful practical knowledge. Independently of the extraordinary undertaking which they are intended to commemorate, they form a collection of facts connected with the industrial progress of the civilized world which carnot fail of luxury, the symbol of his peaceful intercourse, the enta-

producing important results for the future; and even admitting that greater care and more leisure might have produced a more complete work than the Official Cata-logue which lies before us, yet it must equally be admitted that the production itself in the short space of a few months is not the least wonderful event among the wonders of the Great Exhibition."

"A work of immense magnitude, and most carefully and elaborately compiled. Produced with the assistance of men of science, it is intended to form a scientific, historical, and illustrated record of this gathering of the orts, products, and industries of the world; and when finished it is likely to be one of the most interesting manuals of general information in the English language.

"This will be a great is del for all men's shelves; and the Assas Mirabilis 1851 will live in its pages, long after the longest assignable duration to Mr. Paxton's prodigy of glass and iron."

" In the compilation of this catalogue, the official contractors have evinced not only enterprise and activity, but an extraordinary amount of care and of consciunting application. Nothing searcely could be more clear than the whole arrangement of the contents, more easy of reference, more complete even to minuteness, or more com-prehensive in their entirety. Those tooching and majestie nes of Holy Writ are with a solemn significance inscribed upon the title-page-"The corth is the Lord's, and all that therein is: the compass of the world, and they that dwell therein."

"The two 'Official Catalogues' must not be overlooked;

they will be historical monments. The larger estalogue, which is descriptive and illustrated, is a work interesting which is descriptive and illustrated, is a work interesting in itself. The introductory chapters give a locid account of the story of the Exhibition, from its first conception through all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution; and the illustrough all the stages of its execution. trative woodents will render it a delightful work to turn over hereafter, when the images have somewhat faded in our memory.

Examiner.

" Jules Janin has been lately eloqueut on the theme of British punctuality, and there surely never was n more merrial poncenanty, ond there surely never was a more marriellos exemplification of the quality that so stortles the lively Frenchman than the appearance of the Catalogues of Messr. Spicer and Clowes for sale ou May-day morning. Up to a late hoar on the previous day the thing not only seemed impossible, but would have been so to any printer whose dictionary contained ce bete de mot; but, precisely as promised, the goodly quarto of three hundred and twenty pages made due appearance for n shilling, and will remain a really striking monument of the zeal and determination employed in this great enterprise."

Morning Advertiser.

"The volumes of Messrs. Spicer and Clowes will of course be necessary farniture in every large library; and being anything but an nuinteresting estalogue, being truly a real living, talking record of the Exhibition, and talking moreover in a very pertinent and interesting manner, it will be a pleasant book for any man to have upon his

will be a pleasant book for any man to have apon his shelves.

"We need say no more to recommend this catalogue as a work most worthy of its object; a work that will remain for ever as the record of the famous undertaking.

We do not know with what pecuniary results the 'official contractors' may have brought their labourt to a close tit it is certain that they base perfectly kept faith with the public, and that among those who have largely contributed in various ways to the completeness of our industrial trimmph they have established a strong claim to be remembered;

Morning Herald.

"Among the many wonders which the Crystal Palace contained, the Catalogue itself, from the extensive arrangements attendant upon its compilation, and the gigauic encyelopedical size to which it necessarily a welled out, is not the least. We have now before as three goodly sized valunes, containing about 2,000 pages of engravings and letter-press, the result of the literary industry of many

menths, and the faint of the skill and intelligence of a bester rept of citizen commentation, and interpolations, the street of citizen commentation, and or repealed about the citizen commentation of the citizen comments of the citizen comments of the citizen comments of the same commentation of citategors, and systems are many point of interest to the public involved in the commenty point of interest to the public involved in the commenty citizen comments of the citizen comments of the confliction and responses. The same many citizens are comtracted in the citizens of the citizens of the citizens of many citizens of the citizens of the citizens of the citizens of many citizens of the ci

"Every branch of releme, as, and industry is here high and efficiently represented. The most enthing and thin and efficiently represented of the relation of the Exhibition, are here emboded, diversel of all the promping of partiality and all the inflamine of judge near. The literary department has been probabel over most analysis of the control of the properties of the properties of the properties of the minuses workey of object collected in the holding in 115th Part. I would be a support of the properties which it exemine, insumes the noriginal information of which the commiss, insumes the noriginal information of contrast which have then a promisent part in the Exhi-

"In addition to thee difficulties, which have been surmonnted to an invertible degree, it must be observed that the Catalogue embodies to a large extent the science of the control of the control of the control of the control terms of trude are been ja many instances, converted into the precise and embranch language of science; and we it is the control of the control of the control of the science of the control of the control of the control of the terms of the control of the control of the control of the terms of the control of the control of the control of the cauch litherto obtateles have been experienced by conmercial use in their endeavours to streed so not trade

"Of the manner in which the wood engravings, amounting to upwards of 1,200, have been executed it is impossible to speak too highly. They have all the delicacy and finish in many instances of steel; and from many months' personal observation, we can bear testimony to the accuracy with which forms the most complicated and elaborate have been transferred to paper. Unlike a cata-logue, in the ordinary acceptation of the term, it abounds in sources of amusement and instruction for every class and every taste, the vast collection of the Exhibition here finding its literary type, and furnishing matter for enter-tainment and reflection, as well to the fashionable render, the student, the man of science, as to the hard-handed sons of labour, by whose energies and industry the vast pile and its contents have been brought together. the respectable contractors, Mesers. Spicer and Clowes, have amply fulfilled all the stipulated requirements and conditions of the agreement causot, we think, be questioned. Indeed, we have reason to think that they have felt something of the dignity and importance of the ocrasion, and have neted with a spirit and liberality beyond, perhaps, what the pecuniary results would justify. One of the great obstacles to the progress of the work, as well as one of the chief causes of the great additional expense incurred, was the incessant necessity for the alterations of descriptions and places, and insertions of fresh material. In its preparation, however, an amount of literary labour has been expended which communicates to it a value enduring beyond that of the occusion of its production. The wast and wonderful accumulation of the production of human industry, of which it is the type and the exponent, was collected only for a time. Its intention accomplished and its objects achieved, the industrial store is being again rapidly scattered among the uations of the earth. The Illustrated Catalogue, the record of the history and objects of the Great Exhibition, will form an enduring memorial, which few of those who have rambled through the vast collection and can afford the means will willingly

be without. It is somewhat remurkable, as ovincing thu judgment that presided over the objects selected for illustration, that the bulk of them have been the recipients of priso medals. We have only one other observation to ake, and we feel called upon, in justice to the contractors, to offer it for the consideration of the executive committee. During the time this large series of publications was in progress, the greater portion of the ordinary business of the contractors was suspended-the Catalogue itself was put in type at least three or four times over; thus adding another very serious item to the expenses incurred. We another very scrious near or the expenses beautiful think when so many of those who have rendered good service to the Exhibition are being rewarded, it would be a graceful and appropriate set of liberality, on the part of the executive, to waive the claim for royalty, which the terms of the contract implied, even if they do not consider the contractors cutitled to any further remuneration."

"A few weeks more, and of the visible glories of the Great Exhibition but a visible wreck will remain. Memory, as we have said, may reproduce-and will-many a picturesque section und selected object; but less uncern records are required to inform us of the actual value. industrial and scientific, of those contributions from every quarter of the world which we have seen assembled in flyde Park.

" In the 'Official Descriptive and Illustrated Catalogue' we have such a record. The work is without a precedent in the annals of literature; and when we regard the cir-cumstances of difficulty that surrounded the task of its execution, the praise bestowed in those who modertook it can scarcely be too great. The contractors, in that enlarged spirit which appears to have entered into all that belongs to the Exhibition, engaged men of reputation and authorsty in every department of science and manu-facture to contribute such descriptive notes as should render the work eminently instructive. It, thus, contains a body of annotations which express the condition of human knowledge and the state of the world's industry in 185t :- and is a document of the utmost importance, as a summary report of this vast interuntional 'stock-taking, which no great library—nor any gentlemen's library, of those who aim at the collection of library standards—can hereafter be without. It is not the work of a day, a month, or a year; it is for all time. Centuries hence it will be referred to as authority on the condition to which man bud arrived at the period of its publication. It is at once a great Trades-Directory informing us where we are to seek for any particular kind of manufacture - a Natural to seek for any particular and of manufacture - a resource. History, recording the localities of almost every variety of native production—and a cyclopedia, describing how far science has ministered to the necessities of humanity, by what efforts the crude products of the earth have been converted into articles of utility or made the medium of that refined expression which belongs to the province of

"Let it unt be thought that because the Exhibition is over it has falfilled its purposes. It stands to the world in precisely the same relation as do the philosopher and his works. The individual will die; but the thoughts which have been born of him, the truths which he has discovered, live on, quickening and kindling other thoughts and truths. The Exhibition has lived its allotted time, and died; but this Catalogue is the sum of the thoughts and truths to which it has given birth-and which form the intellectual ground whereon the generations that we are not to see must build."

" It will be evident from what has been already stated that a more important contribution to a commercial country than the 'Official Descriptive and Illustrated Catalogue of the Great Exhibition' could scarcely have been offered;—and this will be yet more strikingly shown when we come to the consideration of the manufacturing sec-tions and of the contributions of foreign states. Regardless of expense, this work has been completed by the aid of a the state of the s

pendently of the editor's staff of assistants, some ten other gentlemen were called on to farnish technical informatio and lend the assistance of their knowledge :- so that all possible means have been taken to render the 'Official Descriptive and Illustrated Cataloguo' worthy of the wonderful gathering of which it is the permanent re-

Observer.

" It may be truly said that this is the most extraordinary work that has been ever brought forth in this or any other country, containing, as it does, a mass of infor-mation relutive to the matural and artificial productions to be found in every quarter of the globe, with descriptions of the nature, use, and history of each. If the object of such a publication had been merely to serve the purposes of an ordinary descriptive catalogue, it might justly be observed that for such purposes it has come forth too late, seeing that the objects therein described have been already withdrawn from our view; but these volumes are designed to serve purposes at once more important and more enduring. They are designed to preserve and to fix in the public mind a lasting record of the results to which the industry the ingenuity, and the invention of the world had reached in the year 1851, and to establish a sturting point whence future ages may proceed onward in the march of improvement.

"The first volume opens with a list of the illustrations, This list, simple as it may appear to the eye of an ordinary observer, is suggestive of the extraordinary character of the work in which it appears. The space devoted to this simple 'list' would suffice of itself to form a respectably sized volume; and hence may be inferred the enorme number of illustrations dispersed throughout the work, and which, when examined, are found to be in the beauty and the perfection of their execution, as well as in the judgment by which appropriate objects for illustration were selected, worthy of the occasion which these volumes

are designed to commemorate.

"In noticing this Catalogue, we purposely abstain from attempting to particularise any of the innumerable and able descriptions of works of art or of fancy, or the admirably-executed illustrations with which these volumes abound. Our reason for this abstinence will be appreciated when we remind the reader of the ulmost countless subects which are here described; and of the fact, that of these subjects some thousands are rendered the themes of artistic illustrations, the execution of which reflect the highest credit on the engraver. The publication of this Catalogue was a necessity, which, if left unsupplied, would have incalculably marred the benefits derivable from the great occasion which has called it forth. Great as was the good of calling all nations together to aid in a display such as that which has so long maintained an attraction as deserved as it was unparalleled, a still more substantial, though possibly a less brilliant result, will be found to consist in the valuable record which these volumes contain. To have produced such a Catalogue at an earlier period is now shown to have been impossible. The very magnitude of its merits conduced to create that impossibility; but even ut this period, and at future times impossionity; but even it this period, and at future times, however remote, it will be not less webcome, or less wainted. It was not not the time when a gathering of millions during a period of excitement caused by the feelings incidental to an occasion so imparalleled—it was not at such a time that such a record could have been productive of its destined good to the reader, however pecuniarily profitable a burried work might have been to the publisher; and, so far from regretting the delay, we rejoice at it; for by that delay the intrinsic merits of the work were enhanced, and its value stamped with an enduring character, which will remain as the best and most morally profitable result of the great industrial display of which it is a worthy and most invaluable record."

Weekly Dispatch.

"In addition to the medals to be awarded by the Jarors

memorative of the great event. In connection with this decision, we have received a suggestion which we deem well worthy of the consideration of 'the powers that be It is, that each medal should be accompanied by a copy of the Official Illustrated Catalogue. The Blustrated logue contains a mass of valuable information upon every branch of science, art, and manufacture, which renders it an invaluable work of reference; and its extensive diffusion among the industrial world, could not but be productive of the most beneficial results. And we cannot doubt that Messrs. Spicer and Clowes, the contractors, taking in so spirited and satisfactory a manner, would still further aid the views of the Royal Commission, by not permitting the question of expense to be altogether an insuperable element in the carrying out of what oppears to us a very admirable idea."

"An enduring and valuable record of the industrial marvels which the Crystal Palace contained. The time taken by the editors in preparing this Catalogue has been excellently bestowed. It was, indeed, not n work to be done in a hurry. By way of rade mecum to the Exhibition visitors, there was many acother volume of more manageable size devoted to special countries, departments, or branches of iodustry, besides that marvel of high pressure — the Official Catalogue. In the Illustrated Catalogue the attribute most desired was the permanency of its interest. By accurate well-sifted information, lucid arrangement, and wealth of explanatory designs, this end has been effectually achieved. Long after the rare and enrious contents of the Crystal Palace have been scattered over the world, this work will be valued as a memento and reflex of that marvellous collection. And if at some distant jubilee year another Exposition of human industry should take place under other conditions, and occupying, probably, a vaster space even than that which is now presented to our eyes, the exhibitors of that day will eagerly turn to the Illustrated Cutalogue as supply a standard by which to measure the advances they shall have made in their several metiers since the memorable year of 1851.

"Although, in compliance with the original design of its projectors, the Great Exhibition has itself only an ephemeral existence, it is satisfactory to think that the most ample and complete records will be preserved of its character and details. Few events have attracted such an amount of contemporary publicity. The pen and pencil have both been incessantly at work in perpetuating its industrial triumphs, and when all the material vestiges its industrial triumpla, and when all the material vestigate of the display are removed from our eyes, it will still the in a form the most valuable and enduring. The reports of the Juries in each class will obviously prove an important repertoire of facts and observations, and the information which has been collected in newspapers, in periodicals, and in other channels of instruction, may also be turned to excellent account; but it is to the 'lllustrated Catalogue' that we must look as capable of being made the most complete and satisfactory work of reference hereafter on the great industrial pageant of 1851. That publication now approaches its completion, for three parts of it have already appeared, and the foorth will soon be ready. It is intended that it shall be issued in three volumes, the first two of which will be dedicated to the products of Great Britain and her colonies, while the last embraces the contributions of foreign countries. As far as our own exhibitors are concerned the work is complete, and from the portions that have already been given to the public we are cushled to form a pretty fair estimate of its character and the style of execution. Of all literary labours, that of getting up books of reference is, perhaps, the most tedious and the most thankless. The bare name of a catalogoe kills the interest of the most indefatigable bookworm, after the collection of objects to which it was intended as a guide has ceased to be accessible. The pre-

standard reputation, and a large share of public patropage, when the grass has once more grown over the site of the Crystal Palace, and the great event of this year has be-come a thing of the post. From nunvoidable causes, the contractors, Mesors, Spicer and Clowes, are only complet-ing the last pages of their work as the spectacle to which it relates is about to close; but they need be little alarmed at such a consideration. It has an enduring interest in the mass of valuable information of almost every description which it contains. To put the industrial products of the world under a glass case was a woulderful feet to perform; but here we have a still more extraordinary example of condensation, partly executed and in process of successful completion. The Great Exhibition is reduced within the compass of three not very nawieldy volumes, and to the intellect in all respects, and in most important respects to the eye, its features and significance are preserved. Every object in the collection will be found noted down an described with the amount of particularity due to it. The promptings of partiality and the infirmities of indement are equally excluded from this unbiassed record. An extensive series of illustrations is made to embrace every object worthy of elucidation by the artists' power; and in order that the instructive character of the work may be fully sustained, annotatious written by men of the highest qualifications are introduced to explain processes, point out the character and uses of objects, and develop in brief terms the rationale of the more remarkable or le understood branches of human industry. With these fea-tures of interest, the popularity of the 'Illustrated Cutalogue,' when completed, seems secure. It will prove a complete literary type of the original to which it refers, opening up sources of amusement or instruction to every class of taste, and proving equally at home on the draw-ing-room table, haudled by fashiounble dilettanti, in the study, pored over by the scholar or the man of science, at the merchant's desk as a book of constant reference—in the factory, the foundry, the workshop, as a repertoire for designs, and as highly suggestive for future progress. A more pleasant work to dive into during an idle hour can hardly be imagined, for wherever it is taken up there is something new and striking, and worthy of uttention. The necessity for condensation renders prosing impossible, and the elassification of subjects secures an agreeable variety of subjects without monotony on the one hand, or a miscellmeous effect upon the other. Illustrations have been sparingly resorted to in the first portion, which relates to raw materials, but, as a substitute for this, we have tables and statistics of great value, and a large mass of information entirely original in its character. second part, which is devoted to machinery, numerous diagrams and sketches are introduced explanatory of the different objects exhibited. The ebief interest of the Catalogue, however, in this respect lies in the third and fourth parts, the lutter of which is still unfinished. three volumes will contain, altogether, about 1,200 illustrations, and the greater unmber of them will be given in the last volume, which will be dedicated to the foreign half of the Exhibition.

"This is the proper course to pursue, for the foreign contributions are those which it is most important to have sketched. We are informed that original information of much value and interest has been communicated to the compilers of the Catslogue from the different countries which have taken part in the Exhibition, and that this will form a prominent feature of the work when completed. At present, while the public mind is saturated with the subject, the introductory position of the book may not attract the notice to which it is entitled; but when we are able to look back upon the whole undertaking from a point in the future, and proceed to take its exact measure as an historical event, we shall not fail to be duly impressed with the remarkable character of the information there ontained. Within the limits of 107 pages are compressed Mr. Cole's account of the way in which the Exhibition was got up; Mr. Dighy Wyatr's description of the Crystal Palace; Dr. Lyon Playfair's classification of the artificial world; the directory of the scheme; the list of jarora; and the preliminary notice of the Catalogue by Mr. Robert sent, however, is an exceptional case, and we predict for the 'Illustrated Catalogue of the Great Exhibition' a Ellis, its editor. Mr. Cole's narrative is especially worthy of attention for the insight which it affords into the machinery, by which was projects like the Exhibition can be successfully carried out. Even in this country, where the principle of association is so thoroughly molerate, that machinery must be pronounced to be a master-piece of skilful combinations.

"Let us recall for a moment its chief incidents. A amail body of men, without any infinence of rank or wealth, and forming the conneil of what had previously been regarded as a useless society, conceived, as early as 1845, the idea of an Industrial Exhibition, national in its character. After one fruitless attempt, they engaged in a series of preparatory measures calculated to reader their scheme acceptable to the public and secure of its support. Four years of indefatigable labour claused, and they had gathered around their undertaking an amount of support which they conceived justified them In again bringing it forward. They lind placed it under the direct patronage of the Crown, and had seenred for it, as an appropriate head, the name and the personal exertions of the Prince Consort. A Royal Commission was appointed, in which men of all parties, irrespective of politics, were included In the meantime, the views of the projectors had expanded, and they resolved to give their scheme a cosmopolitan character. The great seats of our manufactures were successfully canvassed for aid, and foreign Governments responded to the invitations given to them, and promised respond to the co-operation. Yet even this powerful combination did not exempt the undertaking from perils that more than once threatened to be fatal. The question of ways and means was for some time a stambling-block in the path, and the Commission long hesitated to assume the pecu niery responsibilities which, in some way or other, it was necessary to provide for in consequence of the determination of Messrs. Munday's contract. At a most critical junc-ture Mr. Peto came forward, and, with a degree of public spirit and liberality which cannot fail to be appreciated, pledged his name for a startling amount. Then, when other difficulties had been overcome, the question of a haiding presented almost insaperable distacles. At the last moment Mr. Paxton end Messrs. Pox and Hender-son rushed to the rescue of the perplexed Commission, and after a succession of dengers, the scheme of the Exhibition was in safety. Had Mr. Cole's narrative been more detailed, it might have been rendered still more attractive; but the author, no doubt, prodently preserved atlence on points which would perhaps have been indiserect to touch upon; and the leading men in the Conneil of the Society of Arts having enined their object, are seen unietly resigning to more exalted names the honour and glory of an enterprise which they not only originated, but rendered practicable by their exertions. Of Mr. Digley Wyett's account of the building, and of Dr. Lyon Playfair's classification, it is nunecessary to spenk, as the public is already well informed on these subjects; but to the directory of the Exhibition and to the list of Jurors some amount of attention is fairly due. In these names ere comprised an extent and variety of practical and scientific talent, the nnion of which on eny one occasion, and for any given purpose, is altogether naprecedented. As the eye glonces over the seeming'y uninviting mray, it is im-possible not to be struck with the curious combination of persons which they present. Leading tradesmen and manufacturers ruh shoulders with the most eminent philosophers of the day, and science, descending from her edestal, mingles freely and phostentationsly with the followers of hard-handed industry. Not only so, but all the nations of the civilized world send the most disti guished of their citizens in the peaceful arts to sit in judgment upon the comparative excellencies of rival products, and to determine at polyglot conferences the stage of industrial progress which mankind have attained. The directory of the Exhibition and the list of Jurors, taken together, form one of the most remarkable organizations that the world has ever witnessed—au organization which, considering its objects, implies not only an act of homage to industry, but a guarantee to civilization. The pages of the 'lllustrated Catalogue,' which contain these names, are as instructive and reasoning as any within its Literary Gazette.

"The philosophy of the Exhibition has yet to be written; but whosoever would wield his pen in this high theme most take the Catalogue as his text-book, and discourse upon the sections which are stereotyped in its pages. We heard a wise man say, 'I enter this place as I would a church: the wonders of God are brought before me, and the achievements of man working in the spirit of truth are here displayed. I always leave this mighty huilding a better man than I entered it. The contemplation in quiet-now the excitement of the Exhibition and its thousands of visitors is over-of the Catalogue which registers its stores must have too its ennobling influences None can know the difficulties attending the construction of such e Catalogue as this who have not been netually engaged on such a work. Under all the circumstances of difficulty by which we know the undertaking to have heen surrounded, we are bound to declare that the work has been most ably performed in every department. Mr. Robert Ellis, to whom the editorial superintendence was committed, has worked most assiduously; and most of those gentlemen who were selected as annotators have added much to the value of the work. On the whole, we much question if in any country, in the same time, any book of the same extent, presenting so verious a character, could have been so well produced. The letterpress is unexceptionable; the wood-cuts are great infilithful; the registration, as far as regards the Exhibiess is unexceptionable; the wood-cuts are good and tion, is correct, and the notes of value. This is no ephemeral catalogue; centuries to come It will be referred to as marking an epoch, and indicating the point to which man had prrived in the industrial arts in the Year of Grace 1851."

Morning Advertiser.

"The reade, on jlanding over the page of this great production, is street, on less with the sumber than the contity, until one less with the sumber than the outly, until or greety, and west indestrial and conserved as a proper of the converse, it is all just to observe that they have more than kept fails with the continuous continuo

"To them, then, the public over a delt of gratitude, as adds—and no mean one—in the fraidion and perfection of adds—and no mean one—in the fraidion and perfection of adds—and one mean one—in the fraidion and perfection of our delta of the perfect
well as typographic excellence, 'time: 'Yet, how the difficulty has been grappled with, and almost utterly overcome, a careful collation of those vas columes will also with we noted ring examiner, 'Mo hall beneathy and diffigurity set him down the the hall beneathy and diffigurity set him down the the hall beneath to be the collation of the difficult task of definition and classification. The

collective idiosyneracies, the varying varieties, the clashing characteristics of 18,000 people of every class and of every nation, for such is the number of exhibitors, are here epitomised, arranged, compressed, chronicled, and, in many hundreds of instances, given to the eye in faithful, elaborate, and costly engravings.

"And all this is achieved, so that the last pealing died away along the huge ribbed curve of the transparent transept, ere the gorgeous gilt-telged record, which is all that shall remain permanently of one of the world's wonders, is laid, in its gay livery of blue and gold, noon the tables of its subscribers. In the words of Charles Dickens, applied to the smaller and cheaper issue, we have here e composition of fifteen thousand anthors; most of them anthors for the first time, who have had their excrescences pruned, and their diction occasionally mended. Now, the first production of an author, if only three lines, is usually esteemed by himself as a sort of Prince Rupert's drop, which is destroyed entirely if a person makes upon it but one single scratch. Some thousands of authors, therefore, must be dissatisfied with the attempts to make it available for public use."

"Thus far Boa's pleasantry as regards the cheap shil-lingsworth; but the 'Illustrated and Descriptive' essays a yet bolder experiment. While it retains the terseness of description, it adds annotations of equal purplicative, ability, and imperitality. These aids to a full comprehension of the Exhibition, from pens of the most qualified writers, set forth in succinct phrase the peculiarities, beauties, and characteristics of the various objects enumerated. This alone must insure the permanent value of the 'Official Catslorue," "

Baily News. "The 'Official Descriptive and Illustrated Catalogue' has now been issued in the form of three not over-bulky volumes. In the front pages of the first volumes are con tained a neat nrmy of industrial charts, of comprehensive induces, and introductory matters, which, along with the 'raw materials' and 'machinery,' form, on the whole, a pretty solid moss of information. The whole of volume the second deals as exclusively with all that is connected with the United Kingdom, as the third and last does with the industrial contributions of the 'foreign states.' lowing so closely as does the present publication on the heels of so many nimble forerunners, it must necessarily fullow, that much that it contains is not of a strikingly novel character, and to a certain extent, the present cat logue has lent its powerful aid in diminishing its claims to priority. Mr. Robert Ellis, the diligent and abla editor, has let us into all the secrets of the Catalogue's gestation. Its type, he tells us, was actually ready, and so were most part of its illustrations, before the memorable ist of May. One vast drawback, however, scon made itself manifest, inasmuch as that which, to the casual observer, might have seemed to contain all the necessary elements of order and symmetry, was, at least for the true purposes of the Catalogue's registry, confusion worse confounded. While some exhibitors had taken up positions which were clearly untenable, others weglected altogether to be at their posts. In this terrible dilemma, which it seems, lasted not days, but months, the contractors, Messrs, Spicer and Clowes, wisely adopted the plan before mentioned, of using the one, which thus acted as a feeler and test of substantive correctness. By degrees, as every one knows, successive editions were issued, in which lacunes were filled no. and inadvertancies properly corrected. And thus, by joint addition and elimination, we are now furnished with the most trustworthy industrial chart that has ever been issued. Besides these considerations, other notable influences were at work to retard progress: there were not merely self-landatory encominus to prune, unintelligible technicalities to lop off, and scientific jargon to pare down, the contractors had undertaken a higher, a more ardness, and more comprehensive task, that of being faithful exponents of the most striking features and instructive lessons derivable from the international gathering. The task, we are bound to add, they have executed in a lucid and masterly manner, which warrants the assertion of the

catalogue's baving been carefully revised by scientific It is pleasant for once to find science descending from its lofty curule chair, and electfully lending its aid to the sister arts. Somehow, one fancies that this is the auspicious dawn of another era; that the learned will no longer muffix themselves sullenly in the sheets of the encyclopedia; and one bails, as it were, the downfall of exploded and abstruse problems. Be this as it may, and without drawing any further distinctions between the commonly wise and the remotely sapient of this or any other generation, it may be fairly said that an immense fund of varied knowledge and sound gratification may be derived, almost at random from these volumes, and the countless facts disseminated throughout their 1,431 pages. "Those versed in chemistry, or endowed with a mechanical comprehension, will unturally revert to the first portion of the 'lllustrated Catalogue,' wherein we notice with satisfaction, not only indicated, but also illustrated, those specimens of buman skill and ingenuity to which of late, especially, the public mind has been attracted, since the long-expected awards of snecessful competition. In this respect, the promoters of the 'Descriptive Catalogue' seem almost to have been endowed with an intuitive, not to say a prophetic sense of individual merits. It must be acknowledged that, even looking at the succeeding volumes from the same point of view, they will be apt to convey impressions of greater interest. Many to whom the most hrilliant mechanical achievements are neither more nor less than singular contrivances, will have a tolerably accurate perception of purely ornamental achievements; these will dwell once more, if only in the faint recollection of them, on the glories connected with the 'Milanese win-dow' and the 'Veiled statue,' the 'Prussian shield,' and other illustrations, which, amid the priversal pictorial deluge, seem to have been withheld by their proprietors for exclusive insertion in the 'Official Catalogue.' It may here be stated that the embellishments to the letterpress have combined the lithographic process, steel en-graving, and wood engraving; though the latter, as usual, preponderates. The archaic pencil of Mr. Tenniel has given extra dignity to the cover as well as the frontis-piece, the latter of which is decidedly Maclisean in design. Let us turn over the tempting page. The arrayed list of contents and their exhibitors greet one, as it were, on the threshold, and by their twin aid we can steer through the tropbled industrial sen. Thus people, anxious to discover what species of heating apparatus has been rewarded by a medal, may search maler either bendings of 'stoves,' or 'Metternich,' and will at once be directed to the 'Austrian Section, No. 413.' Then, nearer home, may be found under either title of 'Tapestry,' or 'Silthorpe'—the latter, no relation we hope to an M.P. namesake—and so on it goes throughout works of more or less universal

"After dwelling in a sufficiently philosophical strain on the strangely varied host of individual characters con-tained in the list, and elbowing each other with alpha-betical respect and order, from His Royal Highness Prince Albert to Herr Zwickl, we next encounter a few brief but Affort to herr Zwiczi, we next encounter a rew ores out telling accounts of the rise and progress of the Great Exhibition. Mr. Henry Cole throws into his introduc-tory notice of the first stages of the proceedings, some novel traits which redeem its backneyed character. The construction of the habiding is narrated by Mr. Digby Wyatt in mingled facts, figures, and sketches. And lastly, Mr. Robert Ellis imparts to us a sense of the alarming difficulties he had to surmount in guthering together the thousands and one little manuscript slips of paper out of which one homogeneous work has arisen; justly remark-ing at the same time that the fact has bitherto been unexampled of bringing to successful issue a work of such monstrous complexity.

"The plan adopted in the long run was to direct atter tion at the opening paragraph of each section to the staple manufactures of the particular country or district; re-serving, nevertheless, purely exceptional facts to be ap-pended to that which was often its sole illustration. If the calm and venerable town of Frankfort exports the over that noxious weed 'chicory;' if the quiet city of

Leyden prides herself on her rigging; if Amsterdam, besides herrings for the million, produces horse-bair for the fiddlebow; Belgium, mill-stones as well as lines; all these facts, great and small, are carefully scratinised, and the weight in the balance of universal atility tested Following out the spirit which seems to bave dictated a gracefal impartiality towards our foreign rivals, the third volume, relating more specially to their efforts, has been evidently got up with extreme care, and a more lavish expendinger of illustration. Their jewellery, their da-mascene work, their laboured groups, their ingenious furniture, have received equal honours at the hands of the draftsman. We can only join in the hope expressed by the contractors, that with the elite of the exhibitors and their contributions, to the numerons localities abroad whence they were derived, copies of this catalogue will be not only sent but taken also, and these pages read in many lands long after the Exhibition has become matter of history. The 'lliustrated Catalogue, in its present comprehensive form, now affords almost the sole industrial source of fatare investigations which are professedly or in any way connected with the yet undeveloped resources of the nineteenth century.

Chemical Record.

" The list of annotators of the Catalogue, who have brought their practical knowledge to the clasidation of the various departments with which they were most conversant, comprises men whose names are guarantees of the value of the information furnished by them, and the appendage of whose initials to the articles described, sups the work with that degree of anthority, without which its practical value to the philosopher, the merchant, the manufacturer, or the general reader, would have been greatly lessened.

"We must not, in our notice of the introductory part of the work, omit to mention the valuable and interesting series of maps which adorn the commencement of the first volume, and on which the various manufacturing districts of our own and other countries are accurately delineated. and their natural productions shown,

"We cannot conclude our brief and imperfect notice of this important work, which Dr. Whewell commended in his inaugaral lecture at the Society of Arts, on Wednesday evening, without stating that the bighest credit is due to the publishers for furnishing so complete a record of the Great Industrial Exhibition. When we consider the immeuse difficulties attendant on the production of such a work-the joint production of more than 1,500 authors. whose varied contribations, in many languages, had to be classified and arranged, and, as far as practicable, onnotated and explained-when we consider that this vast amount of matter was actually in type at the opening of the Exhibition, before even the articles were fully arranged in the building, we cannot but regard the 'Official Illastrated and Descriptive Catalogue' as being itself one of the wonders of the Eabibition. As respects the general style and getting up of the work, we need only say that it is worthy of the publishers, who have evidently spared neither cost nor pains to bring out a work every way worthy both of the great industrial undertaking and of public patrouage and support. The library of the phisopher, the merchant, the manufacturer, the man of science and of refined taste, will be incomplete without the possession of a copy of this truly national work, which, interleaved, will serve the valued parpose of a record of the varied additions to our knowledge which every day present themselves to our attention, but which, the want of a suitable place for their immediate record, pass from the memory almost as soon as received New facts and discoveries, is any department of art and science, whether at home or ahroad, would here find a local habitation—a place in which to be recorded, always easy of reference and access-and thus a vast amount of practical and useful information, now lost, would be stored up for the future advantage of ourselves and others."

Mining Journal.

"Of all the various publications professing to treat of the Great Industrial Exhibition, none have in any way approached, either as regards accuracy or completeness. the work now before us. We believe there never was a work, the preparation of which was attended with so many difficulties; and we consider that the highest credit is due to the publishers, who preferred rather to run the risk of pecuniary loss, than to prescut to the world an inefficient record of an event, which-whether as regards the magnitade of its operations or the complete success which has

attended it - is without a parallel in the history of the world. "The annotations on the articles exhibited in the class of greatest interest to our readers, were wisely intrusted to Professor Ansted and Mr. Robert Hunt, and the result has been the production of a compendium of mining and mineral products, containing 70 pages of valuable matter, descring of publication is a separate form. The account of the nature and extent of the different deposits of mineral fuel in various parts of the world, written by Professor Austed, is replete with information. The remarks of Mr. Blackwell, on the series of iron ores contributed by him to the Exhibition, form a valuable treatise on the ironproducing districts of the country and the ores obtained therefrom, and elicited the marked commendation of Sir Henry De la Becha in his recent lecture at the Society of Arts. Mr. Sopwith's detailed account of the lead mines at Allenheads forms a useful treatise on this department of mineral produce, especially as illustrative of the various stages of progress from the mine to the market. Mr. Hant contributes a store of information on the tin and copper of Cornwall, whilst the general mineral produce is ably annotated by Professor Ansted.

The objects in the class of machines for direct use are illustrated in a very superior style, and their description is replete with sonad practical knowledge. The specimens of successful application of mechanical skill to objects both great and small, and their adaptation to useful purposes in the leading manufactures of oar country, form one of the most valuable portions of the work before us, containing, as it does, a history of the enterprise and industry of the mechanics of Great Britain, not to be met with elsewhere.

"The general style and character of the work through-"The general style and character of the work through-out is very superior, and the profusion of well-executed engravings with which it is adorned greatly enhances in practical value. The library of every Englishman will be incomplete without a copy of this truly national work, which will be headed down from generation to generation, as an enduring record of an event, which excited the wonder of the civilised globe, and formed one of the brightest phases of the present century.

We have from time to time heard various suggestions. put forth, as to the most useful mode of appropriating the surplus of 150,000l, is the hands of the Royal Commisscopers. We consider that in the distribution of this surplus, no country which took part of the Exhibition should be overlooked; and we see up practicable way of accomplishing this desideratum, more likely to give general satisfaction, than that of presenting a copy of the *Official Descriptive and Illustrated Catalogue mechanics' and scientific institution and public library throughout the United Kingdom, and also to the public libraries and institutions of the principal towns of the foreign countries which contributed to the success of the undertaking. Such a present would be a graceful acknow-ledgement of the assistance rendered by each town to the promotion of the general good, would meet with universal approbation, and give such as apportunity of including foreign countries in the distribution of the fand, as could not be well obtained in any other manner."

"Bot it is not as a catalogue, in the common sense of the term, that the three large and handsome volumes before as were ever intended to be considered, or could be used in the nature of things. They are not an introduction, but a comment; they follow, not precede, the vast collection which occasioned them, and our experience of it, The purpose of the entalogue is fulfilled if it moulds and enlarges our views and strengthens our recollections; for neither has it in fact accompanied the general mind to any large extent in the study of the Exhibition itself, nor did it mainly profess such an aim.

"The 'Descriptive and Illustrated Catalogue' is, then, a memorial of the Great Exhibition; and if that was nothing less than a compendium of the industry of the age and a concrete of its tendencies, this is a cyclopædia coudensed. It is well known that the best assistance was secured to render it a scientific no less than an accurate representation of the Exhibition in its several branches. France with her exquisite art, Austria with her proofs of wide and diverse empire, Northern Germany with her multiform thought, Russia with her massive productivegorgeomess, Egypt and Tunis with the lesson of their grand taste, as old as the world and as unalterable in its basis, our Colonics with the elements of their future-the nations from the four points of the compass are returning from our shores; England herself is resolving her congregated industry into its thousand constituents; the phenomenon is gone, and its habitation knows it not-too dubious of its own existence for long; but with these volumes in our possession, the fact will remain still a preseut fact. It has sumped itself not on the retina only and the memory-though it will not fade thence yet awhile, but here also, copiously and enduringly, to be referred to as yet with us. And if the record is valuable to us, its historical worth to future generations as a picture of the nineteenth century, in its products and results, in its ideas of itself, its belief of what it has done, and its expectations of how that is to be applied and rendered fruitful, and of what remains to do, is not easily to be estimated at the present day. We cannot match with it any so complete expression of a period, material and inventive. The age has impersonated itself, and sat for its daguerrectype. Whether we shall be judged as eminently moral or spiritual, or truly progressive, we must leave to the future :

but in one many-sided aspect we may expect to be known. "The work, as we have said, has been ably got up. It presents a very sufficient view of the transactions relative to the Exhibition, as well as of its actual components: hat we could wish, as the publication was onecessity post-posed to so take a period, that it had been drived some posed to state, a period, that it had been drived some many that the properties of the present post of th

ment snight be effected. Inst under all the circumstance of the time and the oceasion, we regard the Chislogue as worthy of the great phenomenon which it records. A work of permanent value, and enduring interest has been produced; and to all parties concerned it must be ashirt faceby to know that the labour which has been belstowed facturer, and the merchant, we repeat this Cattalogue must, for ever, prore an invaluable work of reference.

"The 'Hustrated Catalogue' is, it is true, but an echo of the Great Exhibition. Three volumes can furnish but a faint reflex of the varied works of industry that were erowded together in an area of nearly twenty acres, Such, however, is the power of graphic and typographic art, that in these volumes are contained the essence and very preguant sonl of that so vast body. Thus of roses may be compressed into a few drops of the most precious attur .- a vast volume of vapour may be condensed into one drop of water. Such is the relation which may be assumed to exist between the Great Exhibition and this its Catalogue. Should this record of human industry survive some thousand years, what a picture will it present of the universal activity, the fiery energy, and the indumitable activations of this truly iron age! When generations yet unborn, in turning over its pages, may yet reflect on the wonders of engineering skill and me-chanical refinement which were concentrated within the glassy walls of the Crystal Palace, and remember within how brief a period they had attained to such extraordinary development, the conclusion will be forced on their minds that if the will and energies of the public and the artists of the present day had been directed with corresponding intensity towards carrying the Fine Arts forward to the same degree of perfection, a result might have been realized equal to that which characterized the pulmiest days of Greece."

Weekly Rews.

"Among a profusion of excellent designs by fine-time artists, very carefully outgraved, each high desiring at attention, we amond bely calling to view the following as testimated to the control of the

Boston (American) Post.

Juries,' is the same size pages, and could be bound with it. In this magnificently illustrated work there are several thousand woodcuts engraved in the first style of the art, representing all of the most striking and beantiful objects shown at the exhibition. It will be, with the 'List of Awards granted by Juries,' the only complete, valuable, and enduring record of the 'Great Exhibition of 1851.' I doubt not but there are several score of exhibitors in the United States that will get this work. The articles in the United States department that are illustrated by engravings are the American Chair Company's chairs, Chilson's furnaces, Cornelius and Co.'s chaudeliers, Dennington's floating church, Philadelphia, Ericeson's nantical instruments, Goodyear's India-rubber goods, the Maryland cabinet of woods and other products, and Watson's gazelle

There were few of those splendid works of art from the United States that shone so conspicuously in the departments of many of the old nations of Europe. Powers's 'Greek slave' not long ngo (1850) was engraved in the London Art Jonenal, with a most fair, candid, and every way complimentary criticism. I will mention that Part V. of the 'Illustrated Official Catalogae' is done up as a separate part, and sold at fifteen shillings sterling, (som S4.) and that contains the United States part of the exhibitors, with those of two or three other foreign countries. In the 'Illustrated Official Catalogue,' all, or nearly all, the articles are described much more in extenso than in the brief one-line paragraph of the 'Shilling (50 cent) Cata-These 'Official Catalogues' are the only ones published that are deserving the name of cutalogues, the one called the 'Art Journal Illustrated Catalogue' being a mere list of a few prominent contributors, with engraings, without one-twentieth part of the contributors being mentioned. No person naw who reads this, can say be does not know 'where to find himself in the printed records of the Great Exhibition. I learn that a lot of the Official Catalogues (small), the Illustrated Catalogue in three volumes, and Part V. of the Illustrated Catalogue (separate,) have been sent over to the United States. Let those who have or have not been successful as contributors, that wish a permunent record of the Great Exhibition of 1851, send to his bookseller and get a copy of any or all of these works. As time flies away their value will increase with years."

Arbronth Guide.

The statistics furnished by Messrs, Spicka and Chowes, the enterprising contractors for the Catalogues, and, next, to anmberless other works connected with the Exhibition, show the gigantic and formidable nature of this part alone of the undertaking. These statistics present, ex facie, newhat of a barren, repellant appearance, being given in long columns of nainviting figures; but it is the very carefulness and minuteness of detail thus manifested that give to Messrs. Spicer and Clowes' statistics an added charm. Before proceeding to notice the actual sales of, and the sums realised for, the Catalogues, Official and Illustrated, Hand-books, Synopsis, &c., it should not prove unprofitable to say something of the preparatery

EXTRACT FROM THE FIRST REPORT OF THE ROTAL COMMISSION.

Catalogues.—It was obviously necessary that a complete and accurate Catalogue should be made of the articles exhibited, not only for the use of visitors, and of the Comnissioners, Jurors, and others during the continuance of the Exhibition, but also as an enduring record, in the most perfect shape, of the Exhibition itself. The Commissioners considered that these advantages wen'd be best secured by submitting to public competition the exclusive privilege of preparing and selling the Official Catalogues. Of these the cheaper one was, in accordance with the conditions of tender laid down by the Commissioners, to be sold to the public at the price of one shilling, and to contain not less than 320 pages of foolscap quarto (printed in double Ont of the above sum a royalty of twopence colamns). per copy was to be paid to the Commissioners.

In addition to the Shilling Catalogue, an Illustrated
Catalogue (also official), extending to two or more volumes,

steps necessary to be taken before these publications were fit to be placed in the hands of the visitors to the Crystal Palace. And first as to the trades necessary for the pro-duction of the Catalogues: these were, type-founders, printers' joiners, iron-founders, paper-makers, wholesale stationers, letter-press printers, printing-ink makers, composition roller-makers, engravers on wood, lithographie printers, hot-pressers, and booklinders—in all twelve. Then as to the quantity and value of new type mannfactured, and the quantity of type actually used for the publications. The technical names given by printers to the different kinds of type required we consider it useless to state, as being unintelligible to a general reader. The quantity of type necessary sorely taxes credibility; but the facts are incontrovertible. In addition to the usual the facts are resources of Mesers, Clowes' establishment-the extent of which can be judged of from their employing from 500 to 600 workmen-the supply of new type was 37 tons; the cost of which, and other necessary material, amounted to above 6,000/. Adding the type required for the Report of the Commissioners (the work from which we gather these interesting facts), and for the Jury Reports, a weight amounting to nearly forty-right tous was set apart for the service of the Exhibition of 1851. For each of the three small Official Catalogues—in the English, French, and small Omerat Catalogues—in the English, Presen, and German languages—from three to four millions of types were required; for the "Priced Lists," apwards of four millions; and for the "Illustrated Catalogue," no less than seventeen millions. As illustrative of the amount of type in use in the several publications, the combined quantity, it may be observed, should be equal to the printed surface of 116 single Times newspapers. Next, as to the paper required for the Official Catalogues, and Reports of the Juries and Com-missioners. For the small Official Catalogues 24,173 reams, or 507,631 lbs. weight were required; upon which, reams, or 507,631 list, weight were required; upon wneen, and 337 reams of colonerle paper for covers to these catalogues, the paper darty, at the rate of 1½d, per pound, amounted to 3,4560, 12s. 6d. For the Illustrated Catalogue were required 100,000 lbs, weight of super-royal—the duty paid upon which was 625d. The entire weight of paper used for the Catalogues and Reports immediately warehoused west 756,698 lbs. the duty on which was in or paper used for ine Catalogues and Reports intercenting mentioned was 758,098 lbs., the duty on which was, in round numbers, nearly 4,740%. Of the small Official English, French, and German Catalogues, 305,000 were printed; of the Synopsis of the Contents of the Building, 89,500; of the Popular Guide, 26,000; of the Hustrated Catalogue, 8,250; of the Reports by the Juries, in two different types, 20,550; and of the various smaller publications, such as Hunt's Hand-book, Keys to the Cata-logues, Priced Lists, &c., somewhere about 30,000. The cost in the different departments, for the price of compositors' labour, eugraving, lithography, hot-pressing, binding is also noticed by Messrs. Clowes. As to the sule of the different volumes—Plans, Keys, Hand-books, Gnides, Catalogues—the number sold, it may be briefly stated, was 473,731, realising 19,014l. 8s. 4d.—a sum which, we have grave doubts, will prove anything hut an adequate return to the spirited Contractors for their

immense outloy.

was to be produced, the price and manner of printing of which was left to the discretion of the contractors. An option of preparing more editions than the two above mentioned was also given.

The Commissioners adjudged the right of printing and sale of these Catalogues to the joint tender of Messra. Spicer Brothers and Messrs. Clowes and Sons, who offered the sum of £3,200 for the privilege (besides the royalty payable on the sale of the small Catalogue). The difficulties necessarily attendant upon the execution of the engagements entered into by the Catalogue contractors (owing not only to the extensive nature of the undertaking itself, but also to the changes consequent upon the continual arrival of additional articles from foreign countries for a long period after the opening of the Exhibition) were surmounted by them in a very satisfactory manner, and the volumes that accompany this Report will serve to show, both by their accuracy, completeness, and their general execution, that the Commissioners have every reason to be satisfied with their having intrusted the preparation of the Catalogues to Mesors. Spicer and thows.

r Appendix No. XXVII. contains a statement furnished by the contractors, showing the extent of the sale of the edifferent Catalogues, and other works illustrative of the Exhibition, which they were authorized to sell in the Building.

The printers of the Catalogues are type-founders as well as printers, and by working night and day, with relays of hands, they produced a great portion of this quantity themselves: the assistance of other founders, however, was necessary; and the Messrs. Milter and Riebard of Edinburgh, and the respective firms of Besley, Caslon, and Figuins, of London, supplied the remainder.

and Figilis, or Louwon, supplied the remainder.

As as illustration of the amount of type in use in the
various publications, it may be observed that the combined
quantity would be equal to the printed surface of 116
single Times' newspapers.

A great subdivision of labour is necessary in the manu-

A great subdivision of labour is necessary in the mannfactor of type: the persons employed are usually in the proportion of 5 men in a boys. The following statement shows the weight of four descriptions of type mannfactured in one week by 20 men and 12 boys, and the number of separate types in each quantity:—

360 lbs, Small Pica, equal 124,720 separate types, 240 Bourgeois, 122,880

240 , Bourgeois, 122,880 , 190 , Brevier, 113,280 , 168 , Minlow, 109,200 , Although type is moch lower in price now than it was

some few years back, it is still an expensive article, so no much from the cost of the raw material—a compound of lead, antimony, and tin—as from the amount of Indoor necessary for its production, five operations being required necessary for its production, five operations being required and the heavy representation of the production of the warm out. In the case of the small English Citalogue, from the large number of copies printed, the value has been deteriorated at least 60 pre cent.

been deteriorated at least 60 per cent.
The price of type varies according to its size; each page
of the small English Catalogue cost 20a, 624, and of the
Illustrated Catalogue 21a, 944, Large as these prices may
appear, they are exceedingly low, when compared with
the average market price, and are such as could only be
obtained by contracting for the manufacture of large
quantities.

Poper.—The manafesters of paper includes a variety of processes—from the sorting of the rags to the production of a complete sheet of paper. Two sizes only were necessary, described as super-royal and double-foolkeep; the folding of the sheet into 4, 8, and 16, forming the different-sized books. For the convenience and economy of printing the small Catalogue, the double-foolkeap was, however, made into four sizes, the sheets folding into 8, 12, 16, and 24

The three six consisting of 16 pages, was princed on one of these large sheets, at one impression. The entire quantity of paper musuffeatured was 338 tons; and list production required labore qual to 588 hands (nem and (Wholesale Stationers.) joint contractors in the production of the Calcilogue, snapided the whole of the page; and o efficient were their mrangements with the various miles curred in the appointed times of delivery.

The small Official Catalogue, with its cover, before the edges were cut, weighed I fb.; the daty on each copy was therefore I dd., or I the selling price: equal to I 2½ per cent, on the cost of the Catalogues, but 21 per cent, on the manufacture of the news.

Compilies and Printing.—The Catalogue Forms issoed to the Exhibitors (in order that they might supply their own descriptions of the articles exhibited) were printed in four colours, representing the four great divisions of the Exhibition; on the receipt of those forms they were examined by the compilers, who made such alterations sa they considered requisite; determined, to the lest of their judgment, the Class to which the article exhibited more especially belonged; and forwarded the returns thus especially belonged; and forwarded the returns thus corrected to the printers. On Jan. 30 the first portion of these returns was placed in the hands of the compositors, and speedily set up in type for the Illustrated Chatlogue; keeping each of the four divisions reparate; and distinguishing, by a figure at the end of the last line of each article, the presumed Class to which it belouged. Proofs of these returns were forwarded from time to time to the compilers, who examined them as to their general correctness, and returned them to the printer for such emendations as were necessary: these effected, 50 proofs were printed, and forwarded to the Excentive; to the editor, who transmitted copies to the various sunotators; to the compiler of the small Catalogue, in order that the descriptions might be reduced: and to the French and German translators, for the same purpose of reduction and trans-lation. Ten weeks now had elapsed—the 20th of April had arrived-the whole of the exhibitors' returns received up to that date were in type, amounting to nextly 2000 pages; this mass, however, as astill marranged; and it was not notif flour days previous to the opening of the Exhibition that any-defined plan of classification could be determined upon. The contractors were bound under a penulty to produce a certain quantity of the small Catalogue on the first of May; to effect this within four days by the contractor that the Illustrate Chaintogue should also appear at the same time, but all hope of predicting mything more than a specimen Part was abandoued.

The classification, which should have been the labour of literary men, became the task of the operative printer: the type was arranged in 368 slips, each representing a page; slip after slip was taken up by the compositor, and the exhibitors' returns, as unmerically distinguished collected together, nutil the whole 30 Classes of the United Kingdon were arranged. The same arrangement neces-sarily took place for the Colonies and Foreign States; for nithough each State had but one numerical order for all the articles exhibited, they stand in the Catalogue in the respective State in the same order as the 30 Classes of the United Kingdom; newards of 100 distinct arrangements had to be effected; the classification completed, revises were forwarded to the compiler, to receive the numbers by which the articles were to be distinguished in the Building; 320 pages was the prescribed limit of the small Catalogue, and 368 pages were in type; a further reduction had to take place in the description of the articles ex-hibited; and it was not until the midnight immediately receding the opening of the Exhibition that the small

Catalogue was finally " ready for press."

The first or specimen Part of the Illustrated Catalogue was also proceeded with on the same principle laid down for the production of the small Catalogue; and on the

morning of the 1st of May both these works were on sale in the Exhibition Building.

The printing in itself would have been but a small affair for the number of persons employed, could the matter have been placed before them according to the usual routine of authorship and printing; this, however, was impractedable; and no better plan could perhaps have been suggested than that followed to a most vacces-ful terminations and through most extraordinary difficulties.

After the opening, additional returns came in. The first ecition was found exceedingly imperfect the neprentedons of Classes molectook the examination of the proofs, supplied omissions, and corrected the numerical nerrangements; many articles were found in one class that tolonged to another; the exhibitors descriptions had again longed to mother; the exhibitors descriptions had again 41 pages; and a second edition was produced, with greater labour and exertion than the first.

New returns continued to come in—removals from one class to another were still found necessary, and it was not until a third edition was produced, at n cost of labour equal to the two preceding, that a correct Catalogue of the

Exhibition could be said to exist, Under these circumstances it was found impracticable

Under these circumstances it was found impracticable cicher to produce the Illustrated Catalogue in a complete form, or the French and German translations, antil a late period of the Exhibition: and as the labours of the printer did not really commence until within four days of the opening, so neither did they terminate until within foar days of the close of the Exhibition.

A detail of the progress of the Illustrated Catalogues would be a repetition of the circumstances connected without the small Catalogue; inaxmoch, however, as the larger work is five times the size of the smaller, and the care and attention required more minute, the cust and labour in the printing-office were at least ten times greater.

Freech and German compositors were employed on the foreign translations. The Exhibition of all Nations, however, had created a demand for foreign papers; and the compositors, knowing that the employment on the Catalogues would not extend over a long period, sceepted other engagements; and those works were finally and successfully brought to a close by men who knew not a word of the respective languages: French and German

readers, howevers, were employed to insure correctors, The repeated alterations and transpositions in the English The repeated alterations and transpositions in the English forcing Catterpress. The same mechanical classification, applied to the English, evuid not be effected: a number of persons were therefore employed to cut up seek return of persons were therefore employed to cut up seek return respective class and country, and again place them in the compositors' hands for reproduction. Of the French Catterpress were the composition of
The time occupied in printing the various works was 216 days. The whole of the other employments necessary for their production were also completed within the same period.

Period.

Every alteration in the small Catalogue ereated a corresponding alteration in the Illustrated Catalogue, and in the French and German translations.

The eost of these alterations, compared with the usual cost for setting up the types, was—

On the small Catalogue as four to one.

"Hinstrated Catalogue as five to two.

", German Translation as fice to one.

And to this most be added, as an increased element in the
expense of printing, the extra amount received by the
workmen for night-work, equal to 10 per eent. on the

workmen for night-work, equal to 10 per section to the wages paid.

Wages paid by the honor for corrections: the complete arrangement of abgresson. Tabular Statements similar statements similar statements similar to the Priced Lists are attended with extra trouble.

to the Priced Lists are attended with extra trouble, and are paid double the price of nther work; and works in Foreign Languages a small increased price per 1,000. From the circumstance of all the types need for the Catalogues being new, the Compositor had an advantage of about 10 per cent. on the day's work.

The honrs of attendance are from 8 in the morning antil 8 in the evening. When the men are employed during the night they receive extra payment, equivalent to 40 per

cent. on their earnings.

To this branch of printing must be added readers and reading boys, in the proportion of one reader and one boy to each 12 compositors.

From the extraordinary number of proofs required during the progress of the Catalogues, four proof-pullers were constantly employed so long as the empositors were at work: 54 reams of paper, equal to 27,864 sheets, were

consumed in proofs only.

There are two descriptions of machines employed in printing: the cylinder machine, attended by one man and two boys, predneing on the average 7,000 impressions per day of 10½ hoors; and the platten machine, managed by one man and four boys, averaging 4,000 impressions per

one man and four boys, we engage 4,000 impression per deep The machine and tools me of hereby primate or both sides (or Lood impression), the price verying or both sides (or Lood impression), the price verying to which the contract of the contract of the contract to worked by two men and it is refinanted that, on the ment description of printing, two new world problem; lood to the contract to the contract of the contract to the contract of the contract of the contract to the contract of the contract of the contract for the contract of the contract contract to the contract of the contract of the contract of the contract impression were produced in a day, and, in addition to the contract of the contract properties where the contract contract to the contract of the contract to the contract of the contract to the contract of the contract to the c

cogravings on wood, preparatory to the printing.

To the Press and Machine Departments must be added persons to wet the paper before printing, and others to dry and press it after printing, and deliver to the hinders. The average number of persons employed in "wetting" paper was equal to 6 men for 80 days.

Comparative Power of Production of Hand-Presses and Steam-Machines.—Comparing the press and the cylinder machine, the size of the paper and the quality of the work being the same, the press will produce 1,250 copies and the machine 7,000 in the day, at about the same cost for labour; and comparing the press with the platten machine, the press will yield 1,000 copies, and the machine 4,000, at the same cost; the quality of the work always being in favour of the press,

This high rate of production, however, is only attainable where the number of copies required is large; where the numbers to be printed do not exceed 2,000, not more than one-half these quantities can brobtained on the average; and when less than 2,000 little advantage is gained by using

the steam-machine. The machines, however, have an advantage over the ress in size, which doubles, and in the larger machines, press in fize, which domines, and in the index most and tribles the quantity produced; while the press can only print 8 pages of the Catalogue at each impression, some of the machines printed 48 pages at one operation.

Taking the small Official Catalogue as an example.

290,000 complete copies were printed at t5 cylinder machines, in 42 days; it would have required 47 handpresses 97 days to have produced the same result; or, while t5 machines, with 15 men and 30 boys, produced 7,000 copies of the Catalogue daily, 47 presses, and 94 mes, could have produced but 3,000.

The following Table shows the average number of

Printing Ink .- The cost of this article forms no incon siderable item in the expense of printing. The ink used for the Catalogues was manufactured by Messrs. Shackell and Edwards; the quantity required for the small Catalogue amounting to nearly 4,000 lbs.; for the Illustrated Catalogue about 400 lbs.; and the entire quantity con-sumed on all the works printed for the Exhibition not less than 6,000 lbs. The ink for the Illustrated Catalogue is a fine specimen of black, made purposely for the printing of wood engravings. Printing ink varies much in price, according to the quality: that used for the Illustrated Catalogue is nearly four times the cost of the ink used for the small Catalogue; but as a less quantity of the finer description is necessary to cover the same amount of surface, the comparative increase of price is somewhat reduced. Engraving.-Three classes of artists are necessary for

the production of an engraving—the designer, the artist who transfers the original drawing to the wood-block, and the actual engraver. The designer is usually considered the superior artist, although the elaborate workmanship exhibited on some of the engravings in the Illustrated Catalogue would make this point somewhat doubtful: two, three, and even four weeks having been occupied on a single illustration. Engraving is a profession followed by both sexes: many engravers are also designers; and where this is the case, the highest point of excellence exhibits itself in their productions

U1.wards of six thousand pounds have been expended on this department: it would be difficult to form more than an approximate estimate of the number of persons engaged, but as a Supplementary Volume is in the course of preparation,-prohably not less than 200, from the commencement of 1851 to the present time.

Lithography. The art of printing from stone also con-tribated towards the embellishment of the Illustrated Catalogue. The Plan of the Building was lithographed in three colours, and employed a draughtsman 10 days to complete three stones: 96,417 impressions were therefore necessary to obtain 32,139 copies, and was equal to the work of 3 printers for 108 days: 22,187 of the Plans were

mounted; this operation employed 6 persons 40 days.

The Prince of Wales' Shield occupied one draftsman 9 days, and the Liverpool Model 6 days, in lithographing; and printing 9,000 copies of the former, and 11,000 of the

The Kieff Bridge—a Deautiful specimen of tinted lithography—employed the artist 14 days. To produce the desired effect, three stones were used; and as each impression was the result of three printings, 6,000 copies employed 3 men 24 days

When the numbers to be printed are large, transfers to other stones can be mode: and by this meaus, with the aid of additional presses, copies can be rapidly multiplied. This process, however, is only applicable to ink drawings, such as the Shield and Liverpool Model; but for chalk drawings, similar to the Kieff Bridge, it is scarcely practicable. tienhle.

The entire impression of the Kieff Bridge, and the greater portion of the other lithographic illustrations, were executed by Messrs. Day & Son, and the remainder by Messrs, Standidge.

The coloured map of the Geographical View of the Great Exhibition, by Mr. Petermann, was engraved on stone (a process combining despatch and excellence of execution). It was found necessary to refer to at least 150 different maps and books, in order to identify the various localities from whence the contributions to the Exhibition were supplied; and occupied 3 persons upwards of two months in compiling and engraving; printing 7,000 copies

(and for which two printings were necessary) occupied 4 men 70 days; and the colouring 6 persons about 50 days. Het-Pressing restores the fine gloss and smoothness that the paper originally possessed before printing; and which the wetting and the impression from the type destroys. After the printed sheets are thoroughly dried they are After the printed sheets are thoroughly dried they are placed singly between highly glazed thin card-boards, called Pressing Papers, and it certain intervals a hot iron or zino plate is introduced. When a sufficient quantity has been thus prepared, the batch (as it is technically termed) is placed in an hydraulic press of great power, for 8 or 10 hours. In cold pressing the only difference in the process is in the use of cold instead of hot plates. The pressing of 6000 remas employed 4 men and 4 hoys for 75 days.

Binding. The services of 12 binders were retained to

effect this last operation in the production of the small Official Catalogue; and, by the united efforts of not less than 500 persons, 20,000 copies were sewn and covered in the course of a few hours

The binding of the Illustrated Catalogue was intrusted

entirely to Messrs. Remnant, Edmonds, & Remnant, and the Messrs. Westley & Co., in addition to the binding of a very large portion of the small Official Catalogues Presentation copies of the small Catalogue, and of the

Presentation copies of the similar Catalogue, were also prepared for Her Majesty and H.R.H. Prince Albert, on the opening of the Exhibition. These books were elegantly bound, with gilt edges, by the Messrs. Westley & Co., in the short space of six liours. The division of labour in hinding is great: the various

processes are performed by men, women, and young persons of both sexes. To complete the small English, French, and German Catalogues—the Priced Lists—Index -and the English and French Synopses-nine operations were necessary for each book; the hinding of these various works gave employment to 20 men and 100 women for 80

days.
The Illustrated Catalogue required 17 operations to produce a complete volume; and hinding the whole impression afforded occupation to 40 men and 90 women for about 48 days.

By Authority

Royal Commission.
